Announcement

Faculty Up-gradation Programme in Environmental Economics at Undergraduate level

The First four-week Faculty Upgradation Programme in Environmental Economics at undergraduate level under the World Bank Aided Environmental Management Capacity Building Technical Assistance Project will be held at the Indian Statistical Institute, Calcutta, during 1 November to 26 November, 1999.

Applications are invited from College and University teachers and also teachers in engineering, management and law colleges/universities who are teaching or are likely to teach in the near future environmental economics course at the undergraduate level. Priority will be given to eligible candidates from the States of Bihar, Orissa, Assam, Tripura, West Bengal, and the other North Eastern States.

Eligibility

- 1) Minimum of 55 per cent of marks in M.A./M.Sc. as per UGC regulations.
- 2) At least 5 years of teaching experience and preferably some knowledge of quantitative techniques.
- 3) Other things being equal, preference will be given to teachers who are currently teaching environmental economics at the undergraduate level.
- 4) Age below 50 years as on 1 November, 1999.

Cost

The entire cost of selected candidates for participating in the programme will be met by the Indian Statistical Institute, funded under the project. This shall include either 1st class or 2nd class AC travel by train or bus including incidental expenses during travel, board and lodging at the Institute and supply of course material. All outstation participants will be provided accommodation on campus. The local participants may commute for which they will be paid a fixed travelling allowance besides working lunch.

Application, through proper channel, from the prospective participants with full details about educational qualification, teaching and research experience, if any, current institutional/university/college affiliation should reach,

Vol XXXIV No 26, No. 26984 Date 3-6-2000 August 7, 1999

Indian Economy, 1950-51 to 1997-98: Growth and Structural Change

A comprehensive and consistent set of macro-economic data for the Indian economy integrating the national accounts statistics of the CSO with the balance of payments and monetary data of the RBI as well as the fiscal data on the budget financing operations of the government of India for the 48-year period from 1950-51 to 1997-98. Integrating the basic time-series on national accounts with related aggregates helps depict the growth of both the real and the financial sectors of the economy as also the structural changes over the years. The identification of certain empirical patterns facilitates translation of important theoretical constructs into policy relevant solutions and interrelationships. 2243

Hindu Nationalism in Indian Politics

The role of Hindu nationalism as a developing ideology in contemporary Indian politics can be fully addressed only by acknowledging the discursive proximity between Hindu nationalism and the ideology of Indian nationalism independent of the structure of polarisation between (religious) communalism and (secular) nationalism. 2269

Market, State and Agrarian Distress

The spate of suicides by agriculturists in Karnataka was largely the result of ecological, economic and social crises. The situation calls attention to the problems of commercial agriculture in the region and to the role of the state in inducing such conditions. Internal social complexities such as the growth of local usury and the increasing individualisation of agriculture compound the distress. 2263

WTO and Dumping

Developing countries are unlikely to agree to a review of the WTO Agreement on anti-dumping measures. So it is for the developing countries to put up a combined front and press for a review. Japan may support their cause at this juncture, having been subject to some severe anti-dumping action recently. 2210

Behind the Veil in UTI

The Deepak Parekh report on UTI's US 64 tells us what has happened, not why and how it happened. These questions have to be addressed and answered. The Parekh report will have served its purpose if it leads to this effort. 2208

Communication and Politics

The upsurge of the politics of identity is an outcome of the 'communicative dynamics' of the mainstream development mode in which both the state and the market fail to establish a communication network wide enough to involve all segments of society. Interactions are made almost exclusively with the upper, visible and dominant segments whereas the vast numbers of the rest are subjected to silence or at best to superordinate, unilateral 'communication'. 2230

After Mandela

Thabo Mbeki is widely regarded as the author of South Africa's macro-economic strategy of growth, employment and redistribution (GEAR). Now that he is the country's president, will Mbeki be able to adhere to the fundamentals of the strategy? And will he receive support from market players worldwide? 2223

Narmada's People

Amidst the hoopla surrounding the 'Rally to the Valley', it is important to look at the Narmada issue from bottom up. What are the views of the poorest activists who deal with the dangers of displacement, even death, in their everyday lives? Why do the people of Anjanvara continue to take extraordinary risks against overwhelming odds? How do they perceive the choices before them? 2213

Caste over Region

While regional identity has remained weak in Haryana, the state has evolved its own style of politics whose distinguishing feature is its preoccupation with caste. 2217

Pavlovian Response

The malpractices and criminal activities which have been revealed to have been going on for years in Nagpur University have prompted the university's chancellor, the governor of Maharashtra, to appoint an enquiry committee. Such pavlovian responses will not, however, address the ills of our seats of higher learning of which the shenanigans at Nagpur University are a concentrated manifestation. 2215

Steel and Trade

All through the recent crisis in the steel industry in the US, government agencies and politicians alike, all otherwise strong votaries of free trade, have been emphatically seeking measures quite in contravention of WTO agreements. 2220

The Real Surrender

ALL the Vajpayee-bashing reviews of the recent conflict in Kargil started at least with a ritualistic tribute to the valour of the Indian jawan. Against this background, your edit of July 10 does indeed stand out both for its anti-government tirade and the belittling of the Indian armed forces. The recent denouement in Kargil may not be much of an Indian triumph. But to say that the "Pak retreat is not attributable to the Indian jawans" as you assert is still hard to take. One can readily believe that the US president did plenty of arm-twisting. But is it conceivable that the Pak forces would have accepted his meddling meekly and withdrawn to their barracks on the Pakistani side if the Indian forces had simply waited with folded hands? There had to be a superior show of force by the Indian jawans on the front "which compelled the Pakistan authorities to accept ground realities" as you say in the next sentence and Indian intellectuals should be ready to accept the fact. Credit should go where it is due, independent of how "Vajpayee and his comrades try to derive maximum electoral advantage" from the outcome. The record of Vajpayee and his comrades is not so scintillating that one needs to invent a virtual stick to beat them up with.

Certainly "no quarters ought to be given any illusion", as you rightly observe. One should also not try and create new illusions. How can your statement that "multilateralisation has come about now, something that we have resisted for half a century" be reconciled with facts? Pray, who took the Kashmir question to the UN half a century back? Who mediated in 1965 and where was the accord signed at that time? Bilateralisation did come into play at Shimla in the early seventies, but that was because Pakistan was under compulsion at the time. Sure enough, there was no follow-up action afterwards as soon as the element of compulsion (90,000 PoWs) disappeared. A logical follow-up as the first step would have been to withdraw the complaint from the UN, relieve the UN observers from the LoC and then start a meaningful dialogue with Pakistan about solving the problem. The Indian government

cannot do that because it has no clear idea what to propose to Pakistan or perhaps because what it wishes to propose (convert the LoC into a permanent boundary) will not be acceptable to the Indian public, leave alone the Pakistani public.

According to reports in Washington papers, Vajpayee pointed out to the American president that the Indian government would soon be compelled to take strong action against Pakistan, if the aggression was not halted. This does not sound very 'panicky'. Yet one may accept your description that Indian diplomats panicked and "an appeal went out to president Clinton...composed in elliptical language". Are your statements that "our government has, for all practical purposes, given in on the nuclear issue. It could be persuaded to make a similar surrender over Kashmir" models of incisiveness and clarity? It seems that you first make an unsupported assumption that the government has already taken a certain decision and then go on with some extrapolatory logic that it "could make similar surrender over Kashmir". Incidentally, could you enlighten the readers about what, in your view, does and does not constitute "surrender over Kashmir"? Does a possible "trade-off of some real estate in Jammu and Kashmir for a steadily rising, luxurious standard of living" to use your words, constitute a surrender over Kashmir? If not, what, in your view, is

'victory' in Kashmir and surrender in Kashmir?

Let us assume for a moment that the Vajpayee government supplicated the US president. Can we categorically say that no earlier government did so? Why is it that the earlier governments did not succeed in getting the US president to twist the arms of Pakistan? The fact of the matter is, in US eyes today, American interests are better served for the moment by humouring India rather than Pakistan. I readily agree with you that on another day, today's only superpower would as quite as easily try and twist India's arms if it would serve its interests and if it thought that it could get away with it. All this means is that India has to be vigilant about it, not get enmeshed in globalisation of its economy and become a neo-colony of the first world. Unfortunately, none of the political parties sporting leftist labels is ready to work for this. The only feeble efforts against globalisation of the economy or tying up the Indian economy to the IMF and to the interests of the G-8 countries have come from an RSS-affiliate. On the other hand, in the guise of making this country safe for 'secularism', the one-time leftists are ready to swallow hook, line and sinker the globalisation line that Manmohan Singh and his ilk are dangling before them. What has EPW to say on that?

ELECTORAL POLITICS IN INDIA

August 21-28, 1999

What are the issues before the electorate in this election? What are the factors that have affected the outcome of the polls in the past? What is the social base of the emerging political configurations in the states? Why have old alliances disintegrated?

Incisive, facts-based analysis of electoral politics in India across states, castes and communities.

For copies, write to **Economic and Political Weekly**, Hitkari House, 6th Floor, 284 Shahid Bhagatsingh Road, Mumbai 400 001.

State under Stress

A PRESIDENT who calls up an individual minister to discuss a cabinet decision that the minister is widely known to have opposed. An Election Commission that arrogates to itself the power to pass scathing remarks on government decisions and to offer what the government was constrained to call gratuitous advice to the judiciary regarding what points of putative governmental misconduct it should apply its mind to while hearing a petition against the government. A high court that transfers, almost casually, the executive's constitutionally ordained power of policy-making to the legislature. These are symptoms of strain within the state as its component parts corrode or lose co-ordination. It is imperative to recognise the problem and carry out pre-emptive maintenance.

K R Narayanan will undoubtedly go down as one of India's most active presidents. More active than is good for the country, say some. On balance, this as yet appears too harsh a judgment. As per the Constitution, the president acts according to the advice of his council of ministers. The president can, if he wants to, send a piece of advice back to the council for reconsideration. If the council of ministers sticks to its original advice, the president has little option other than to follow that advice. President Narayanan has had more occasion to demur than had most presidents in the past, when presented with the cabinet's advice. The first time he returned the cabinet's advice for reconsideration was when the United Front council of ministers led by Inder Gujral wanted him to dismiss the Kalyan Singh government in Uttar Pradesh, on a hurried recommendation by governor Romesh Bhandari who considered it unnecessary to test the chief minister's majority on the floor of the legislature. Then president Narayanan's activism had been hailed by democratic opinion in the country. And the council of ministers did not muster courage to submit its rejected advice another time. The experience was repeated when the Vajpayee-led council of ministers recommended president's rule in Bihar, in the wake of violent disruptions of law and order in the state. However, the president did not come in the way when the cabinet reiterated the advice after yet another massacre.

The president's decision, on the eve of the last independence day, to be interviewed on television, instead of reading out a speech approved by the cabinet had stirred controversy. But Narayanan had stoutly defended the government's policies, including the decision to carry out nuclear tests. A less liked show of presidential autonomy was when Narayanan opined in favour of reserving space on the Supreme Court bench for members of the scheduled castes and scheduled tribes.

Presidential activism went into overdrive after the fall of the Vajpayee government. There was resentment that he gave Congress president Sonia Gandhi a second chance to muster a majority. After the failure to form an alternative government and the country was saddled with a government that did not have a parliament to draw authority from and be accountable to, the president decided to turn positively activist. His decision to call for files and hold discussions with relatively junior officials on more than one occasion has invited adverse comment. Even more unease has been created by the president's consultation on the telecom policy with the man who was relieved of ministerial responsibility for telecom because of his disagreement with the policy that the prime minister's office finally pushed through. The president's decision to weigh in with his own endorsement of the opposition's call for a Rajya Sabha session specifically to discuss Kargil gave rise to whispered charges of partisanship. How should the president's conduct be evaluated?

The first question is whether the president is anything more than an animated rubber stamp. While he is bound by the advice of the council of ministers, the glorified rubber stamp analogy is unsatisfactory even as a caricature of the president's role. Rubber stamps cannot return advice for reconsideration. Even more pertinently, a mere rubber stamp's reluctance to accept advice would not deter the giver of the advice from proffering it again, without a second thought. A request from the president for reconsideration of a cabinet recommendation is politically embarrassing for the cabinet precisely because a great deal of moral authority vests in the president. This is so because the president is expected to be a statesman who would convert his experience and stature into a moral sounding board, conscience as it were, of the government. Now, a good conscience would lead you to better things and a bad conscience could give you acidity and hypertension, but conscience really cannot stop you from doing something you want to. The fact is that the president cannot impose his will on the government beyond a point. The government went ahead with the telecom package and did not call the Rajya Sabha session, in spite of presidential wishes. In the normal course, parliament keeps the executive in check. When the Election Commission's failure to hold swift elections after the dissolution of the 12th Lok Sabha created a situation in which the government has to function for a longish period without a parliament to report to, there is a case for the government's conscience to play a more vigilant role than in normal times. All of Narayanan's extraordinary actions have to be judged in that context. And to the credit of both the president and the prime minister, their

relationship has been devoid of unseemly conflict, even if marked by intrusive give and take.

The more interesting question is what would happen when the amoral disregard for constitutional propriety that has gained much ground in the states progresses to the centre. A governor has the option of referring improper laws formulated by state governments to the president. If the president finds himself being pressed with amoral advice, what should he do? His oath of office mandates him to uphold the Constitution. This cannot mean blindly following the advice of his council of ministers. If the council of ministers makes an unconstitutional recommendation, the president would violate the Constitution both if he accepted such advice and if he turned it down. In such an eventuality, it should be open to him to seek the advice of the Supreme Court.

Unlike the president, the Election Commission can prevent the government from doing things, at least by creating moral opprobrium over violation of the model code of conduct as guarded and interpreted by the commission, if not by legal sanction. The Election Commission's remarks against the government on the telecom package appear wholly inappropriate. The commission's mandate is merely to hold fair elections, not to hold up governance or sit in judgment over the government. The commission would do well to concentrate on its job.

That other organs of the state feel encouraged to take liberties with the executive says something to say about the state of the executive itself. It has compromised itself thoroughly. And no political party can escape blame for this. And they alone can redeem the polity from its ongoing moral and institutional deterioration.

PHARMACEUTICALS

Rational Move

THE wheels of government turn, but slowly. The more than 15-year old efforts of health activists are paying off. Last month the Brihanmumbai Municipal Corporation (BMC) released a list of essential drugs along with standard treatment guidelines to be used in its hospitals and institutions. This would mean that the list will form a base for the purchase of medicines. This will go a long way in cutting costs as well as providing the most appropriate medicines to patients. To appreciate the significance of this it is necessary to take a look at some facts. Firstly, Maharashtra and especially the Mumbai region account for a substantial

proportion of pharmaceutical production in the country. This means that the industry can and has wielded considerable clout in the policy-making bodies of the state and the city. Secondly, the BMC, unlike any other corporation in the country, runs three large teaching hospitals as well as several large public hospitals all over the city. This means that the BMC is one of the largest buyers of pharmaceutical products in the state. So any policy it adopts with regard to pharmaceuticals will affect the industry considerably. The BMC's move is thus noteworthy and commendable.

The preparation and use of an essential drugs list has been a long-standing demand of the drug consumer and health movement. Such a list, it was felt, was a first step towards weeding out irrational and useless drugs as well as prescription practices. The demand has a long history in the subcontinent. It may be recalled that the Hathi Committee had first made such a suggestion, which of course was completely ignored. In fact, it was Bangladesh which took up the recommendation and put in place a drug policy which has been much written about, weeding out not only dangerous drugs but unnecessary drug combinations as well. For over a decade health activists in India have attempted to evolve and have the central ministries accept such a list. However, the centre has been content to depend on the recommendations of the drug technical advisory board on weeding out hazardous drugs. But these recommendations have often been challenged in the courts by the companies manufacturing the preparations and a ban on the drugs has been successfully stalled. Some years ago an attempt at consolidating the several such cases in different courts of the country was made in the Supreme Court. In the course of this the apex court ordered the first public hearing on a banned drug which saw extensive participation by drug consumer bodies and those who had been adversely affected by the drug, which was subsequently banned. However, there is to this day no comprehensive list of bannable drugs.

For the first time some years ago the Delhi government adopted an essential drugs list as part of its rational drug policy. Now with the BMC adopting such a list, it should be easier to move towards rational drug use at the national level, least in the public sector in health care. Not that other experiments have not been taking place elsewhere. For instance, Madhya Pradesh under the guidance of the WHO is moving towards handing over 60 per cent of its drug budget to the panchayats. As several studies have shown, often PHCs are stocked with inappropriate drugs and

insufficient quantities of the necessary ones. With an essential drugs list and a good grasp of the health profile in the panchayat area, it should be possible to stock the primary health care network with appropriate medicines. It is curious that states like West Bengal with a Left Front government continuously in power for so long should not have attempted to adopt a rational drug policy for its hospitals and health institutions.

RAILWAYS

Accidents Will Happen

OVER the last five years there have been, on an average, 1.2 railway accidents every day somewhere in the country. More than 66 per cent of these have been recorded as being due to failure of railway staff. Given this it is hardly surprising that the ghastly disaster at Gaisal, when the Guwahati bound Assam-Awadh Express collided head-on with the New Delhi bound Brahmaputra Mail, occurred. It may be that human failure is prompted by other failures, administrative, political or technical. And certainly these need to be taken serious note of and remedied. But there can be no condoning the human failures in the recent accident: the dereliction of duty on the part of the railway staff at Kishanganj, some 90 km from the accident site, who failed to manually lock the tracks to set the train on the right track; the failure of the staff at the two level-crossings soon after Kishanganj who should have noted the track on which the train was travelling; the complacency of the driver who failed to notice that mistake even though there were enough reasons for an alert driver to have done so; the inefficiency of the staff including the assistant station manager at Panjipara who saw the train through the station without noticing that the train was on the downline hurtling towards the oncoming Brahmaputra Mail; the callous irresponsibility of the station staff at Gaisal, who having failed to notice the train was on the wrong track, fled the scene when the accident occurred immediately afterwards without bothering to transmit the disaster information and secure help for the victims of the disaster in the shortest possible time; the questionable decision of the concerned staff to send the urgently required crane on a route which took twice the time to travel to the scene of the disaster. The accident could have been averted or its impact mitigated if the staff at any of these points had been minimally efficient.

It would be all too easy to 'take action' against the concerned railway staff. And

certainly there is need to do that. However, the larger questions have to do with two issues: one, a qualitative enhancement of the attention devoted to averting disasters in the railway organisation as a whole; and two, why is it that so-called human failure on the part of the railway staff accounts for such a large proportion of accidents? In this day when telecommunications are making such an impact on our daily lives and the country has embarked on what is described as an information revolution, it is incredible that apart from signals, manual and electrical, there is no way that a driver of a high-speed locomotive can communicate with the station or signal staff. This should have been a high priority task – far more important than introducing new trains or even perhaps laying new tracks. And yet, even the Status Paper on Indian Railways does not list this as a projected area of development. Technology, it says, has a significant influence on safety, and lists several measures under implementation, such as track circuiting and an auxiliary warning system for giving advance warning to drivers on signal aspects. But nowhere is efficient communication between the driver and the operating staff considered important. The railways, it is not at all surprising to note, spend on signalling and communications less than 2 per cent of what it spends on wages.

Much has been said about the role of human failure in accidents and often it comes down to dismissing low-level staff immediately responsible. However, inefficiency and dereliction of duty are closely related to the ethos of an organisation and the standards set by those in authority. Moreover, safety exercises need to be planned and executed so that there is not only preparedness but a consciousness all-round about the immense responsibility that railway staff shoulder. Unfavourable working conditions and long duty hours have often been listed as associated causes of human failure, but nothing much has been done about them. Sadly, railway staff unions have not taken up issues of safety either.

News reports immediately after the accident noted that the railway minister had been pressing for a reconstitution of the railway board pointing to the current board's inability to attend to policy matters, especially with reference to safety. It is significant that although five senior officers have been suspended, the senior zonal railway manager has only been asked to proceed on leave, with none of the other top bureaucrats, not even the divisional manager who did not even bother to come to Gaisal, apparently receiving any reprimand. The fact that most railway accidents have occurred due to failure of

railway staff over the decade should alert the government to the fact that far more drastic measures need to be taken and policy decisions made making safety a priority concern, more important than the expansion of the system. The 62,495 km of track route need to be made safe for the 12 million passengers who travel on some portion of it everyday. The commission of inquiry will no doubt take its time in producing the report which will lie gather dust somewhere. In the current context, with a government comprising an alliance of parties in the throes of fighting an election, it is a moot question whether anything concrete will happen and Gaisal has no doubt already been relegated to the backrooms of the railway board.

TOBACCO

Fighting Back

ONE day, in response to a public interest litigation, the Kerala High Court orders a ban on smoking in public places, ruling that passive smoking is a violation of human rights as well as fundamental rights of citizens. Within days of the ban on smoking in public places becoming effective, a so-called Human Rights group, by the name 'Confederation of Human Rights Organisations', urges the state government to put in abeyance the ban on smoking in public places ordered by the high court. The grounds offered by this organisation in favour of holding in abeyance the ban on smoking is that it is necessary "to give people time to kick the habit". Obviously, the group advocates suspending the smoking ban because it is not considered enough for the habitual smoker to smoke in private. Or is it that some special satisfaction is derived from smoking in public and that too in public places? Interestingly, while asking for the ban to be kept in abeyance, the organisation referred to above does not indicate how long the ban should, in its judgment, be suspended to give smokers enough time to "kick the habit" of smoking in public.

On the eve of the No Tobacco Day observed worldwide on May 31, a pressure group called the 'Tobacco Institute of India', set up and funded by the tobacco industry, came out with a statement against any attempt on the part of the government to restrict the demand for tobacco. It spoke of tobacco "as a personal choice product for the adults", unmindful of the harm the exercise of such so-called personal choice causes, and that too not only to the users of tobacco but also to those around them. It is well established that passive smoking can be extremely harmful to people's health

and the Kerala High Court has given its verdict in favour of an immediate ban on smoking in public in order to protect the rights of the non-smoking public.

It is true that currently 40-50 lakh persons are engaged in the cultivation and manufacture of tobacco and tobacco products including beedis in our country. At the same time, it has to be remembered that between 6 and 10 lakh persons die every year on account of tobacco-related illnesses. Three to four times that number are sick and are disabled for that very reason. The question we have to seriously ask ourselves is whether we must continue enduring this cost, in terms of mortality and morbidity affecting between 25 and 40 lakh persons annually, for the sake of employment of 40-50 lakh persons. Should we not, instead, think seriously about alternative avenues of gainful employment for the people likely to be displaced as tobacco-based agriculture and industry decline as a consequence of reduced consumption?

The tobacco lobby has also raised the spectre of revenue loss to both central and state governments as a result of reduced consumption of tobacco. According to one estimate, planted in the media, the offtake of cigarettes in Kerala has declined since July 1 by 30 per cent. If this is really true, it should be considered as an extremely positive consequence of the enforcement of the high court's verdict. This would mean not only that passive smoking in the state would decline sharply as a consequence, but also that the incidence of tobacco consumption among the smokers would come down substantially. The positive impact of this reduced consumption of tobacco would be enormous on the people's health.

There can be serious doubt, however, about the correctness of the estimated sharp decline in the offtake of cigarettes in the state. The purpose of giving out such an exaggerated picture of the impact is perhaps to put some fear into the minds of state governments, faced as most of them already are with a difficult financial situation. Logically, the ban on smoking in public may have very little impact on the demand for cigarettes or other tobacco products. The likelihood on the other hand is that smokers will shift to smoking more in private, rather than reducing the number of cigarettes or beedis they smoke every day. Of course, smoking in private also has its hazards, because it will expose women and children, the passive smokers within a family, even more to the harmful effects of passive smoking. The question then is bound to arise whether some restriction is not called for even on domestic smoking.

CURRENT STATISTICS

EPW Research Foundation

With the cleaning of the monetary data, M_3 growth is found to have slightly accelerated, essentially as a result of a more rapid growth in currency. This is not due to a higher growth of bank credit to government, but because of (a) higher credit to commercial sector, (b) larger accruals of foreign currency assets, and (c) drastically reduced expansion of net non-monetary liabilities of the RBI.

Parekh Report: Piercing the Veil in UTI

D N Ghosh

The Deepak Parekh report tells us what has happened, not why and how it happened. These questions have to be addressed and answered. The Parekh report will have served its purpose if it leads to this effort.

WHEN an institution becomes its own agent provocateur and works against itself knowingly or unwittingly, nemesis is bound to strike it, sooner or later. This is what has happened to the UTI. The Parekh report is the unfolding of a story of unbelievable folly and negligence.

Since the inception of UTI, its US 64 scheme has been its flagship; a debt-oriented income scheme, designed for investors who wish to have a reasonable degree of liquidity and an acceptable level of steady income. The scheme had singular success every year in mobilising funds. The continuing loyalty of investors was an invaluable asset for the UTI.

The UTI has been generous in dividend distribution: from the 11-13 per cent range in the late eighties, dividend yield jumped sharply to 17.86 per cent in 1991-92 and then moderated in the 14-15 per cent range. Though in the context of changing monetary policy and easing of interest rates, the dividend yields were getting out of alignment with the yields on fixed income assets, the trustees of UTI seemed reluctant to make the necessary adjustment. They must have felt, one would guess, that such a step would tarnish the aura and standing of the UTI and chose to remain indifferent to the interest signals and turned to the then surging equity market to offset the downward pressure on income flow. The debt-equity component was altered dramatically from 79:21 in FY 1986 to 37:63 in FY 1998. There was nothing inherently wrong in changing the composition of the US 64 scheme and moving over to a balanced fund, but then the trustees sowed it to the investing community to explain in a transparent manner the changing risk profile and the risk-return ratio. Surely, any fund manager with a modicum of prudence understands that a perceptible shift in favour of equity would necessarily make any scheme more vulnerable to pressures of liquidity and the uncertainties of stock market movements. For the UTI scheme, there was an added complexity in liquidity management: it

was being used as a convenient parking lot for temporary funds by corporate treasurers.

The flow of interest income stream dwindled so sharply that the trustees faced a severe liquidity crunch in meeting their dividend distribution obligation at the declared rates. From Rs 1,638 crore in FY 1994, income fell to Rs 907 crore in FY 1998. Dividend amount disbursed in the respective years were Rs 3,125 crore and Rs 3,126 crore. The gap was met substantially from the sale of equity stocks; the percentage of total income from sale of stocks was about 40 per cent in FY 1994, increasing to 62 per cent in FY 1998. Over and above this, for three years in succession (FY 1995 to FY 1997) the trustees were compelled to draw upon reserves to meet the dividend outflow.

The UTI statute places a clear and unequivocal responsibility on the Board of Trustees to act on business principles in the interest of the unit holders. It is puzzling why the trustees continued for several years to pursue a policy which was patently unsustainable and was bound to put in jeopardy the long-term interests of their loyal investors. Companies everywhere try a little window dressing to show themselves in a flattering light but the practices in the UTI distorted the true and fair picture of business to an extraordinary degree. The trustees should not have allowed that to happen; they held positions in an institution which purports to preach to and enforce on their borrowers and investors high principles of corporate governance and disclosure.

It is hard however to persuade oneself to believe that the trustees were or could have been so naive. The Parekh Committee surmises what could have influenced the trustees and puts it mildly in one sentence: "The dominance of nominees appointed by the initial contributors to the capital, which were all public sector financial institutions/banks may have resulted in direct/indirect interference by the Government in the investment policies of

the scheme" (emphasis added). The UTI's investment in PSU shares is cited as an instance. The corpus of US 64 was utilised for supporting the disinvestment programme of government in utter disregard of the interests of investors. As on June 30, 1998, Unit 64 had an investment of Rs 3,722 crore in 22 PSU stocks, having a market value of Rs 2,325 crore, a depreciation of Rs 1,397 crore. Of the 22 stocks, only one stock had a marginal appreciation and all the other 21 stocks had depreciated significantly over book cost. This was not an isolated example of intervention. "The scheme has often been used" the committee asserts "to support the stock markets in times of crisis thereby giving an impression of its being used as an instrument of public policy rather than for the sole interest of the unit holders...the Trust, at the suggestion of the Government, has from time to time utilised the large corpus of US 64 to support the market, and the fund managers could have invested on various occasions due to factors other than prudent investment management, and without consideration of the return to unit holders" (emphasis added).

These are serious allegations; unmistakably the trustees allowed themselves to be utilised as agents of the political executive. Note, in this context, another observation of the committee: "Asset management function at the Trust is highly centralised with the decision-making being vested at the highest level of management. Despite its significant corpus, there was no separate management for the scheme, investment decisions were highly centralised and inter scheme transfers effected without taking an independent view of the need of each scheme". We cannot shrug it away as a mere technical or managerial lapse; the existence of highly centralised investment management is significant, it facilitated the process of compliance with informal administrative guidance from the political executive. Possibly this explains the seemingly naive behaviour of the trustees in disregarding the canons of ordinary financial prudence; they could not have done so unless they had the comfort of an implicit assurance that, when the day of reckoning came, the institution and its investors could count on the protection of the government. Recall the bitter controversy that erupted three years ago between SEBI and UTI, the former keen to extend its regulatory domain and trying to bring the fund management

activities on par with the other mutual funds and the latter desperately attempting to wriggle out of regulatory discipline, it can now be surmised to conceal its financial sickness. All the while when the controversy was raging, the government chose to remain a mute spectator; its deliberate silence was construed in the market as a clear message of support for the UTI. Clearly, it was unwilling to risk any new arrangement under which transparency and disclosure could be enforced on an institution which has proved to be, even in the post-liberalisation reform phase, a convenient and handy political instrument for interfering in the market process.

The recommendations of the Parekh Committee relate to some of the deficiencies in the internal working of the UTI. If the recommendations were implemented, we would see, in the months to come, a revamping of the board of trustees, professionalisation of the investment management department and modernisation of systems and procedures. But all these would provide no cure for the deep-seated malaise which has been afflicting the UTI. The Parekh report tells us what has happened, not why and how it happened. But it must be said, to the credit of the committee, that the report gives a more than sufficient hint of where to look for the real reasons. What were the occasions when the government asked the UTI to support the market? Why did the government intervene and at whose behest? Which are the interest groups which benefited from such intervention? Was the government so beholden to these interest groups that it chose to set aside the interests of the investors? The report does not go into these questions. The committee had a limited mandate and, understandably, it must have thought that by doing so it would be exceeding its jurisdiction. But these questions have to be addressed nonetheless and answered. We need to probe into the kinds of relationships that must have developed over the years between the political executives and the trustees of the UTI.

We have since the early 1990s put through a series of measures in the financial sector for enhancing competitiveness, changing ownership patterns and creating a supportive regulatory ambience. We take it as axiomatic that these will sweep away the existing configuration of interest groups, which are responsible for the type of incestuous relationships that have entrenched themselves in our economic system. The interest groups are highly resilient; they know how to transform themselves and assume deceptive forms

and devise innovative methods in any changed scenario for protecting and preserving their core interests. The political class is no different; it is continually exploring how, in substitution of direct methods of control, it can develop and nurture informal and congenial relationships to influence the functioning of market-oriented institutions. More than the formal structural characteristics, it is the nature of such relationships that would define the content and pace of the process of reform in the financial sector. If we wish to lay the foundations of a sound and reformed financial system, we have to

consciously strive to understand and reorder the kinds of relationships that exist between the political executive and the key financial institutions. The political executive is necessarily subject to different kinds of pressures and influences from a whole array of interest groups who have stakes in the financial system and the pattern and networking of such relationships have to be brought under the full public glare. We must not rest content with a few cosmetic changes and shy away from a full-scale investigation. The Parekh report will have served its purpose if it leads to that.

NEW JOURNAL

Science, Technology & Society

(An International Journal Devoted to the Developing World)

Editors:

V. V. Krishna, CSSP/SSS, Jawaharlal Nehru University, New Delhi.
Roland Waast, Institute de recherche pour le developpement, Paris

Launched in 1996, it is the first truly international bi-annual journal published in March and September every year, and devoted to the developing world in this emerging interdisciplinary field of Science, Technology and Society Studies (STSS)

The relationship between science, technology and society is a complex one, particularly in developing countries. The study of this relationship through scholarly and multidisciplinary inquiry is necessary if we are to understand the ways in which advances in science and technology influence society, and vice versa.

Science, Technology and Society invites research articles and reports from scholars in natural and social sciences working in one of the STSS areas of sociology of science and technology, economics of technical change and innovation studies, social history of science, philosophy of science, science policy studies, gender relations in science and technology, development studies relating to science and technology issues, energy and environmental studies, R&D and technology management studies, quantitative studies in science and technology, etc.,

Science, Technology and Society is a peer reviewed journal which endeavours to combine a scholarly perspective with policy relevant issues drawn from the above fields.

Special Issues published so far:

- ++ Changing Trends In Science Policy 1(2) 1996
- ++ International Mobility of Brains in Science and Technology 2(2) 1997
- ++ Comparative Perspectives on Technological Learning 3(1) 1998
- ++ Special Symposium on Science, Technology and Society Studies towards the 21st Century 4(1) 1999
- ++ Social History of Science 4(2) 1999

Authors should provide four hard copies of their research contribution. Articles must be typed in double space, on one side of the page only, with generous margins. Articles should be between 6000 to 8000 words. All contributions should be sent to the Editorial Office, STS Journal C/o Dr. V. V. Krishna, Centre for Studies in Science Policy (Room No. 232), School of Social Sciences, Jawaharlal Nehru University, New Delhi 110067. For further information contact: vvk@jnuvsnl.ernet.in

WTO Agreement on Anti-Dumping Misuse and Case for Review

C Satapathy

Developed countries such as US, EC and Canada are unlikely to agree to review and modification of the WTO Agreement on anti-dumping. So it is for the developing countries to put up a combined front and press for review. Japan may support their cause at this juncture having been subject to some severe anti-dumping action recently.

THE WTO Agreement on Implementation of Article VI of GATT authorises application of anti-dumping measures only in the circumstances provided for in the said Article VI subject to investigations initiated and conducted in accordance with the WTO Agreement. Anti-dumping measures can be unilaterally imposed by a WTO member on an imported product provided the imported product is dumped, it is causing material injury to the domestic industry, and there is a causal link between the dumped imports and material injury. The amount of anti-dumping duty cannot exceed the margin of dumping, which is calculated as the difference between the normal value and the export price of the product as provided in Article 2 of the WTO Agreement.

In recent times, there has been a sudden increase in the number of anti-dumping cases all over the world especially in the steel sector (see C Satapathy, 'Protectionism versus Unfair Trade in Steel', *EPW*, January 30, 1999). There is a growing feeling that many of these cases are initiated at the instance of domestic industry as protectionist measures. There have also been suggestions to do away with anti-dumping laws (e.g., see 'Dump Anti-Dumping', *EPW*, May 29, 1999, p 1303). Anti-dumping provisions have their roots in the ethical concern that free trade should be accompanied by fair trade practices. 'Dumping' is considered to be an unfair trade practice and originally it was supposed to reflect price differences on account of predatory pricing. However, studies have shown that only 3 per cent of anti-dumping cases in EC and 4 per cent of anti-dumping cases in the US involved possible predatory pricing (*The Economist*, November 7, 1998, p 82). Recent examples of anti-dumping action by almost all the major steel producing coun-

tries against steel imports from one another can hardly be justified on account of predatory pricing. Many economists have held the view that predatory pricing is more or less impossible. This view has been recently re-emphasised in John Lott's new book *Are Predatory Commitments Credible?*

Of late, the word dumping has also been loosely used to cover trade in product of countries where workers get low wages and low health and other benefits. Sometimes this is also called 'Social Dumping'. Similarly, trade in products from less protected environments is being called 'Environmental Dumping'. For application of the WTO Agreement, as it is worded at present, dumping need not be related either to predatory pricing or to lower labour and environmental standards in the exporting countries. The mere fact of price differential coupled with demonstration of material injury and causal link is enough ground for levying anti-dumping duty.

Historically, anti-competitive practices including predation were first sought to be prohibited under the Sherman Antitrust Act of 1890 in the US. On account of court rulings restricting its application for foreign companies, first the Anti-Dumping Law of 1916 and then the Anti-Dumping Act of 1921 were enacted. The Anti-Dumping Law of 1916, still in force allows victims of predatory dumping to approach US courts for civil damages and penal action as well as for restricting imports. The 1916 law also required the complainant to prove that the foreign supplier resorted to predatory dumping with the intent of destroying or injuring a US industry. In the past, there were hardly any cases filed under the 1916 law, but recently there have been reports of fresh cases. Despite the fact that the 1916 US law provides against predatory dumping,

it is widely believed to be antiquated and incompatible with the WTO agreement and some countries have since raised disputes against this law in the WTO ('Wheel-Pitt Tastes Partial Success in Trade Case', *Metal Bulletin*, February 1, 1999, p 19 and 'Tokyo Set to Take US Steel Dispute to WTO', *The Financial Times*, January 29, 1999). Interestingly, the US law under 19 USC 3512 clearly states that no provision of the Uruguay Round Agreement that is inconsistent with any law of the US shall have effect. It further goes to say that nothing in the said law shall be construed to amend or modify any law of the US or to limit any authority conferred under any law of the US, including Section 301 of the Trade Act of 1974.

The Anti-Dumping Act of 1921 of the US on the other hand became Title VII of the Tariff Act of 1930 (the Smoot-Hawley Tariff Act). Later on, the Trade Agreements Act of 1979 replaced the Anti-Dumping Act of 1921 by adding a new Title VII to the Tariff Act of 1930 but the provisions of the 1921 law largely remain on the statute. These provisions have been frequently used over the years for protecting US producers without often taking into account the interests of US consumers. Under the 1921 US law as modified in 1979, sale in the US market at a price below normal or fair value in the producer's home market constitutes dumping. Initially, the US Treasury Department was administering the law which involved determining first that the good under investigation was being or was likely to be dumped and then, that the US industry was being or was likely to be injured or was prevented from being established on account of such dumping. At present, the US Commerce Department determines the dumping margin and the US International Trade Commission determines the injury. Unlike the 1916 law, the 1921/1979 law has no concern with predatory pricing and predatory intent. Mere price disparity is sufficient to attract anti-dumping action subject to injury being determined. It is difficult not to notice striking similarities between the 1921/1979 US law and the Uruguay Round WTO Agreement.

Cass and Boltuck (1999) have provided numerous examples of unreasonable calculations by US authorities that result in more anti-dumping orders and higher anti-dumping duties. For example, a change made by the Trade Act of 1974 in the 1921 law allows the US authorities to exclude

of production from the data set for calculating normal value. This artificially increases the normal value and the margin of dumping. Secondly, while calculating dumping margin, negative margins used to be zeroed out. Fortunately, this method has since been changed. Thirdly, where the home market sale in the exporting country is less than 5 per cent of production, calculations are to be made on the basis of third country market, but in most cases there being no satisfactory third country market, constructed value is used for calculating normal value. This method provides many opportunities to add various costs to make the normal value high. Similarly, the normal value is hiked by adding an amount equal to normal profits without taking into account periods of low demand and low prices. Cass and Boltuck have documented similar problems regarding determination of injury. They have also questioned why anti-dumping law condemns price discrimination when price discrimination occurs in numerous domestic contexts.

The recent anti-dumping complaint filed by small US oil producers demonstrates that such anti-dumping cases have a clearly protectionist agenda. The complaint claims that Venezuela, Mexico, Iraq and Saudi Arabia are dumping crude even though three of these four countries are members of the Organisation of Petroleum Exporting Countries which often limits oil production to raise prices. In fact, under an export cut-back arrangement between Mexico, Saudi Arabia and Venezuela, petroleum exports have been reduced by 51 million barrels. As a result, Mexican oil prices have risen \$ 5.35 per barrel between February and May 1999. Many developing countries are agitated about such frivolous complaints as well as repeated anti-dumping action against the same product, the cost of fighting anti-dumping cases in developed countries and the huge economic cost of failed anti-dumping investigations.

In fact, the discussions at the WTO General Council preparatory to the Seattle Ministerial Conference scheduled in November 1999 have provided an opportunity for many WTO members to propose review of the WTO Agreement on anti-dumping. These discussions are being held in the light of Paragraph 9(a)(i) of the Geneva Ministerial Declaration of May 20, 1998 which mandates the WTO General Council to take up issues, including those brought forward by members, relating to implementation of existing

agreements and decisions. It is understood that many WTO members have brought up several important issues in the context of the agreement on anti-dumping which need careful consideration. Most of the proposals for review of the agreement stems from the perception of many WTO members that its provisions are being misused or abused for protecting domestic industry. Many review proposals aim at rectifying the weaknesses of the agreement to prevent its abuse.

Article 2.4 of the agreement requires that comparison between normal value and export price should be fair. It requires dumping margins to be established on a weighted average basis or on transaction basis. It also provides for exceptions under which comparisons are permitted between individual export prices and weighted average normal prices. It is an experience to many members that exceptions have become the rule in the hands of importing country administrations. The exception, are preferred by these authorities as they result in computation of artificially high dumping margins. Many members feel that Article 2.4 of the agreement should be reviewed to avoid frequent use of the exceptions provided therein.

A major weakness of the agreement is the standard of review contained in Article 17. It unduly restricts the role of the WTO Dispute Settlement Panel to a mere determination of whether the anti-dumping authority's establishment of the facts was proper and whether the evaluation of these facts was unbiased and objective. This is in total contrast with the power of panels under Article 11 of the WTO Dispute Settlement Understanding. The Anti-Dumping Agreement, being an integral part of the WTO, should not have a different and more restrictive standard of review allowing the anti-dumping authorities of importing countries to escape from closer scrutiny by the WTO panel. Article 17 requires to be reviewed and reworded to ensure the same standard of review as applied to disputes under other WTO Agreements.

Many developing country members have been subjected to repeated anti-dumping investigations in respect of the same product. New investigations are often initiated on the same product immediately after termination of an earlier investigation. This has become a serious concern for developing countries as their exports to major trading countries have been disrupted by such restrictive action. Many member countries from the developing world perceive that the benefits of trade

liberalization get considerably nullified by such unfair use of back-to-back anti-dumping investigations on the same product. There are several suggestions to prevent such misuse of the agreement. One of the proposals is to review Article 5.3 of the agreement to limit the scope for repeated anti-dumping investigations on the same product. Another suggestion is that if there is an investigation resulting in non-imposition of anti-dumping duties, there should be a gap of at least one year before another investigation of the same product can be initiated.

Article 5.8 of the agreement does not provide a time limit within which the determination has to be made as to whether the volumes of dumped imports are negligible or within the prescribed threshold. This gives rise to arbitrary and unilateral decisions for determining an appropriate time frame. Article 5.8 needs to be amended to specify the time limit so that there would be no scope for arbitrary and unilateral decision in this regard. There are also suggestions that the threshold limit under Article 5.8 should be increased from 3 per cent to 5 per cent for imports from developing countries and that the provision for clubbing imports from different countries within the threshold limit for applying the collective limit of 7 per cent should be abolished. There are also proposals for increasing the *de-minimis* dumping margin of 2 per cent of export price to 5 per cent for developing countries. This would ensure non-imposition of anti-dumping duty till the dumping margin exceeds 5 per cent on products from developing countries which may in many cases have a cost advantage over comparable products produced in developed countries. The *de-minimis* provision of 5 per cent should apply not only in newly initiated cases but also in review and refund cases.

Many developing country members also feel that the process of investigation on dumping is expensive and cumbersome. Often unsuccessful dumping cases impose huge indirect costs on trade including enormous legal costs and tie down the exporting companies in uncertainty up to a year or more. There are suggestions to simplify the agreement to prevent its misuse by domestic industry in the importing country as a protective cover.

Some members are also concerned about national anti-dumping laws not being compatible with the WTO Agreement on anti-dumping. They feel that such incompatibilities survive on account of ambiguities contained in the agreement. Low

industrial tariffs and more open trade after the Uruguay Round have led domestic industry in the importing countries to make greater use of such ambiguities to obtain protective cover. The agreement needs to be reviewed to remove such ambiguities and bring national legislation in line with the clear provisions of the agreement so that its abuse can be prevented. The agreement also needs to take cognisance of changes in the world trade environment including increased cross-border trade by MNEs, expansion of artificial trade arrangements, location of production facilities across a number of countries and creation of Harmonised Rules of Origin. Review of the anti-dumping agreement should also make it clear that the Harmonised Rules of Origin, once in place, should apply equally for anti-dumping purposes as well as for other trade policy instruments so that no member can take recourse to the ambiguous provisions and apply a different set of origin rules for the purpose of anti-dumping alone.

Many WTO members are also concerned that recent increase in the number of anti-dumping cases may nullify the benefit of reduced tariff barriers and benefits of free trade. They feel that access to anti-dumping measures should be restricted to avoid its abuse for protectionist purposes. Anti-dumping measures should be taken as an exception to the rule of non-discrimination and MFN treatment. Anti-dumping duty directly interferes with tariff bindings and its imposition at very high rates compared to low tariffs practically prevents the exporter from further selling in the same market. Moreover, anti-dumping measures once imposed continue for long period of five years and there are instances of these being continued beyond five years. The agreement not only needs review for rectifying ambiguous provisions but also there is a need to incorporate specific provisions for curbing initiation of inappropriate anti-dumping measures. Many members also feel that the present agreement gives excessive discretion to the anti-dumping authorities in the importing country to use the same as an instrument of protection rather than as an instrument to counteract dumping.

Article 15 of the agreement recognises the special situation of developing countries. It also says that constructive remedies should be explored before applying anti-dumping duties on developing country members. These well intended provisions lack clarity and have become practically inoperative. The developed country members have rarely explored the

possibility of constructive remedies before taking anti-dumping action against exports from developing countries. Developing member countries are of the view that Article 15 should be operationalised and made mandatory.

Many member countries are dissatisfied by the way constructed value is computed and liberally used at the slightest pretext. Recourse to constructed value should be taken only when prices of third country markets are not available. This would require amendment of Article 2.3.

Article 9.1 of the agreement leaves it to the discretion of the anti-dumping authorities to impose an amount equal to the full margin of dumping or less. Many members feel that Article 9.1 should be amended to make it mandatory for imposing less duty if that is adequate to remove injury to the domestic industry rather than leaving it to the discretion of the importing country.

There is a suggestion that the definition of 'substantial quantities' provided in footnote 5 to Article 2.2.1 is rather restrictive which promotes unreasonable findings of dumping. Therefore, it has been suggested that the substantial quantities test should be increased from the threshold of 20 per cent to 40 per cent.

The mere initiation of anti-dumping investigations which are terminated later on without levying anti-dumping duties causes harassment to exporters apart from imposing legal and other costs. Questions have therefore been raised about the legitimacy of anti-dumping complaints brought by producers in the importing country as also regarding the impartiality of the anti-dumping authorities in the importing country. The fact that under Article 17 of the present agreement, the WTO Disputes Panel does not have full authority to review the action of the anti-dumping authorities has led some to think that possibly an alternative approach should be found for taking anti-dumping complaints to a neutral body such as the WTO panel for determination in a fair manner. This would remove the bias of the importing country administrations which face enormous pressure from their domestic industry as well as from legislators representing constituencies where home industries are located. Another related suggestion has also been made that anti-dumping action should be exporter specific and in no case should a general determination be made against exports from the country as a whole since the idea is to curb unfair trade by particular exporting companies.

In a letter to *EPW* (Mayank Johri, 'Don't Dump Anti-Dumping', July 3, 1999, p 1738), a suggestion has been made that the developing countries which embark upon tariff reduction and trade liberalisation need the protection of anti-dumping law against unfair foreign competition. It is interesting that some countries have proposed review of the WTO Agreement to take care of the increased susceptibility of developing countries to the incidence of dumping from outside. These include suggested provisions in the agreement for presumption of dumping of imports from developed countries and application of standards which are less rigorous.

Cass and Bolttuck (1999) have no hesitation in saying that the case for anti-dumping law, beyond the central cause of predatory price-cutting, is open to question and that its administration is seriously flawed if the goal is to address welfare-reducing trade practices and not simply to protect producers against competition. They have also alluded to the frequently advanced argument that anti-dumping codes (along with similar codes on subsidies) have greatly facilitated international consensus about general trade liberalisation which, in turn, has been an engine of economic growth. Anti-dumping laws provide a kind of escape valves for trade protection without which the multilateral trade agreements might not have gained the acceptance they have enjoyed. In that sense, such laws are the price to be paid for trade liberalisation.

It is doubtful if the developed countries such as the US, EC and Canada would agree to review and modify the WTO Agreement on anti-dumping. It is for the developing countries to put up a combined front and press for review. It is likely that countries like Japan would also support their cause at this juncture having been subject to some severe anti-dumping action recently.

[This article reflects the author's personal views.]

A Grain of Sand on the Banks of Narmada

Amita Baviskar

How are the poorest of adivasis in the Narmada valley dealing with the dangers of displacement, even death? Why do people in Anjanvara, on the banks of the river, continue to take extraordinary risks against overwhelming odds?

IT was the middle of the night. After the 22 km walk to reach Anjanvara village, we were deep in exhausted sleep at Khajan's house. Suddenly, a hoarse shout jolted us awake. 'Khajandadu! Khajandadu! Gaav ma pani aavi gayo!' [Khajandadu! Khajandadu! The water has entered the village!]. For one moment, time stood still. Then it registered: it wasn't raining. It hadn't rained for the last 10 days. The Narmada was swollen, but still well below Anjanvara's houses and fields. Water could not possibly have entered the village. Khajan was up too, trying to calm the man who was still shouting. It turned out to be Jamsingh, a neighbour, who had been drinking steadily the night before. Jamsingh must have dozed off into this nightmare.

Just a drunken dream, but one that lurks night and day in the mind of every person in this village. One day the water will swirl in – the river always rises swiftly, and everything will be swept away – houses, crops and cattle. The people of Anjanvara now live with this terror even as they fight desperately to prevent it from becoming real.

The Narmada Andolan is 14 years old. In the last four years, while the case against the Sardar Sarovar Project (SSP) was being heard in the Supreme Court, the issue had faded from public memory. This year, the court allowed the Gujarat government to construct another 8 m of the dam. At this height, the dam threatens to submerge more tribal areas in Gujarat, Maharashtra and Madhya Pradesh. Just when the SSP seemed to be a lost cause, the intelligentsia's interest in the issue was revived by Arundhati Roy's eloquent essay 'The Greater Common Good'. The essay was followed by an event where urban supporters expressed their solidarity with the struggle in the Narmada valley. Amidst the hoopla surrounding the 'Rally for the Valley' and the media attention focused on this celebrity-crowded event, it is important to look at the Narmada issue from the bottom up. What are the views of the poorest adivasis who, in their everyday lives, deal with the dangers of displace-

ment, even death? Why do the people of Anjanvara continue to take extraordinary risks against overwhelming odds? How do they perceive the choices before them?

In this account, I attempt to communicate the concerns that move the men and women of Anjanvara in the current phase of their struggle. I also hope to convey the clear-eyed way in which these villagers have made decisions that often strike outsiders as quixotic. Anjanvara is a village of 43 Bhilala households on the bank of the Narmada, in Alirajpur tehsil, Jhabua district, Madhya Pradesh (MP). The village is surrounded by hills sparsely covered by mixed deciduous forests. I first lived in Anjanvara 10 years ago as a researcher.¹ Later, I worked in the area with Khedut Mazdoor Chetna Sangath, an organisation of tribal peasants working for economic, political and cultural rights. Living here was an immensely rich experience for me. I learnt Bhilali, made friends among people of a very different culture, shared the exhilaration of being part of a mass movement as well as the intimacies of everyday village life, its scandals and humdrum ups and downs. After moving to Delhi to teach in 1994, I continued to visit the village for long spells over the next five years, but for various reasons, I did not go to Anjanvara after that. I had now come to the village after four years. The cliché was only too true: much water had flowed down the Narmada during this time.

The first shock was the river itself. On the long walk downhill to Anjanvara, the first glimpse of the Narmada had always been a delight to look forward to. The spirit soared at the sight of the clean water flowing forever, gleaming in the sun. Now the Narmada has stopped flowing. At Anjanvara, the river is still, its stagnant water muddy with sediment that cannot be flushed away. Dead, diseased livestock that was disposed of in the river now stays there and festers. The deep mud along the water makes the old joys of drinking, washing and bathing in the river a poignant memory. Women now make do with

water from small streams that dry up to a trickle in the summer. Arundhati Roy is so right when she writes that "anyone who has loved a river can tell you that the loss of a river is a terrible, aching thing". In the 'gayana', the central Bhilala myth of creation, the world begins from a state of chaos when the mountains change. In the myth, the proper mode of worship and the magical powers of music help to tame the powers of nature. Now, as the river changes, a familiar world is plunged into chaos once again. The Narmada of the gayana, a generous life-giving girl, seems beyond the reach of rituals. What magic will make her flow again?

Across the river from Anjanvara lie the villages of Maharashtra. The distance is spanned by enduring ties of kinship and marriage. Women from Anjanvara marry 'paldhad' (on the opposite bank) and vice versa. Emotional and economic support cements these alliances. Through the seasons, there is a constant traffic of people visiting relatives, carrying small gifts – some mangoes or groundnuts, for instance. Besides this everyday reciprocity, there is the help accorded in times of crisis, when money has to be raised for brideprice, or when someone wants a patch of land to farm. For married women, particularly, access to their natal village is a precious thing.

This summer, Anjanvara watched the villages across the river close down. A road was built all the way along the river and, one by one, the houses paldhad were dismantled and taken away to the resettlement sites. For those who are staying on, the emptied villages signal the end of the social universe as they have known it.

While the trucks were ferrying people and their belongings, the men of Anjanvara also hitched rides to visit relatives at the Taloda resettlement site in Maharashtra. Budhya's two daughters who were married into Maharashtra have shifted their homes to Taloda. In Budhya's view, Taloda is better than most other places. His sons-in-law have got irrigated land. Since Taloda was a forest that was denotified to settle adivasis, it is relatively easy to get fuel and fodder and other forest produce. Of all the experiences with displacement, this seems to be the least painful.

Budhya's opinion about Taloda, and about forest land as the closest approximation to what adivasis want, is echoed by other people in Anjanvara too. They don't want to move. But, if worst comes to worst, they would need forest land where the entire village can be resettled as a unit. Unfortunately, even this modest requirement is not being met in their home

the largest area under forests, the MP government has not found any land where it can settle its adivasi population. On June 16, 1999 the newspapers reported an MP government order that forests could be denotified for mineral prospecting. Clearly, there are two sets of laws – one for mining companies and another for adivasis.

The utter callousness of the MP government is all the more shocking when contrasted with chief minister Digvijay Singh's celebration in the media as a 'green', pro-poor politician. According to the terms of the Narmada Water Disputes Tribunal, Anjanvara has the right to choose whether to stay in MP or resettle in Gujarat. The MP government has made sure that this right is never exercised. After all, if all the 193 villages to be displaced by the SSP stay on in MP, what an administrative headache it would be! And then there is the displacement from Maheshwar, Narmada Sagar, Onkareshwar and all the other dams planned upstream. Much better to not set a precedent by giving Anjanvara a decent deal. Let Gujarat handle them.

Gujarat. If there is one thing that Anjanvara is sure about, it is this: they don't want to go to Gujarat. They have visited resettlement sites there and they have seen the misery. Waterlogged fields, no livestock, fragmented families, hostile neighbours, no commons to collect fuel and fodder – this sums up the experience of most adivasis from MP who were given land in Gujarat. To be sure, there is the rare exception. Dhankia, the ex-sarpanch of nearby Kakadsila, got reasonable land where his hamlet was resettled as a unit. Dhankia is said to have profited from resettlement. He illicitly felled lots of teak from the Kakadsila forests and sold the timber in Gujarat. He also made money from every family that left. Just like the old sterilisation campaign, resettlement also provides for a 'motivator' who earns a commission for every person he delivers to the door of the 'doob' officer (submergence officer). For hustlers like Dhankia, there is money to be made at every step, and he has even bought a motorcycle and a tractor. But most adivasis are not hustlers; they are poor farmers. Their ability to negotiate with the government on their own is minimal. They are almost structurally fated to get short-changed.

Then why are some people leaving? All of Anjanvara is unitedly staying on, but they have seen their neighbours' numbers deplete over the last few years. This is the power of the politics of attrition. This is how governments wear people down by

of tribal villages along the Narmada has faced sustained government action against them – the absence of all development inputs, the forcible surveying of lands and homes, and the brutal suppression of protest. Cases have been filed against them, people have been arrested and jailed. Anjanvara was the scene of a police firing in 1993. Six years later, the case still drags on and people still have to appear in court at Alirajpur 80 km away.

Then there are the government's assurances, blandishments and promises, backed by the looming threat of the dam. 'Leave now or you will drown like rats when the water comes'. What do you do? Do you have a choice? At the Narmada Forum conference held in Delhi in 1993, Gujarat government officials and pro-dam scholars were outraged when Bela Bhatia, who had meticulously documented the resettlement experience of Gujarat oustees, described the process as 'forced eviction'.² Six years on, forced eviction continues.

Anjanvara has still not budged. Nor has neighbouring Bhitada. Entire villages and hamlets are doggedly staying on. What prospects do you have if the water comes, I ask. Well, what prospects do we have if we leave, they ask. Impasse.

Meanwhile, life goes on in Anjanvara. The entire village assembled to sacrifice a goat to their ancestor Kutra Kunasa, to end the seasonal taboo on cutting teak leaves. At the clan feast that followed, people chatted about sending their children off the next day to the ashram school in Mathvad. When I had first come to Anjanvara, no one could read or write in the village. I made a start, but it fizzled out after I left. Then the Andolan posted a young school teacher here and he has taught many children now. Last year, nine of them enrolled in the Mathvad boarding school. This year, they plan to send 15. The government school is officially recognised and funded, but children learnt far more in the Andolan school in the village. Khajan's 14 year-old son Radya can read and write fluently, but he has been placed in class I. He is so bored that he spends his time copying out bhajans (devotional songs) that he has learnt at school. Leafing through his notebook, I notice that all the songs are in Hindi and are about Hindu deities. One of them begins, 'Ayodhya mein namo re', exhorting singers to worship in Ayodhya (the place where Babri masjid was demolished by Hindu extremists). Do you sing any of your own songs at the school, I ask. Radya, who like most adivasis, can sing through the entire night, shakes his head.

Despite the cultural dissonance Anjanvara is enthusiastic about education. Education smartens you up, they say. There is an added keenness to this newfound desire for schooling. Some where lurks the hope that their educated youth will eventually get government jobs. Sending kids to school is a way of investing in their future and yours. It's a very long shot indeed, but one that makes sense in the context of the dam.

Seeing Radya in unfamiliar shirt and trousers, ready to leave for school, reminds me that Anjanvara has prospered since I was here first. No one could afford trousers earlier. The years of reprieve given by the Supreme Court stay were marked by good monsoons. The road built across the river and the trucks plying back and forth enabled Anjanvara to buy synthetic fertilisers which they had never been able to bring to their remote village before. The produce is much more now, they say. For the last few years they have also been protecting teak trees in their village and the regeneration is impressive. Both the land and the forest are flourishing.

This year, the crops have been sown. The young maize and tamar are already growing. But it hasn't rained for 10 days. The bajra and jowar will probably have to be resown, as will the groundnut and other pulses. What crushing irony! The rain will bring water for the thirsty crop and people pray for rain. It may also ultimately flood the land. Anjanvara has been living this paradox for some time now. They shrug their shoulders and carry on living – worshipping, ploughing, marrying, cooking and bearing children, and singing them to sleep. Despite its hardships, this is still the life they prefer. This is where they want to be.

The larger issues of rehabilitation to all, of other dams, of a National Rehabilitation Policy, why displacement in the first place, are very important. What I offer here is a fragment, a partial view of one village, a grain of sand on the Narmada riverbank. Anjanvara may be just a detail. But they say that god is in the details. For the Supreme Court, for the P D Desai Committee, and for the government of Madhya Pradesh, it must matter that the people of Anjanvara should not face ignominy and a living death.

Higher Education: The Ones That Get Away

J V Deshpande

The malpractices and criminal activities which have been revealed to have been going on for many years in Nagpur University have led the governor of Maharashtra, as the university's chancellor, to appoint an enquiry committee. It is very unlikely, however, that this pavlovian response will at all address the ills of our seats of higher learning, of which the shenanigans at Nagpur University are a concentrated manifestation.

NO one has succeeded in designing a fishing net that catches only small fish and lets the big ones slip away and no one ever will. No one, that is, except the legal and bureaucratic systems that pass for the administration in India. Only a few weeks back, a judge in Tamil Nadu absolved ministers and senior members of the administration in that state of responsibility for an alleged act of corruption in the state government they head. The honourable judge held that just because the then chief minister and the minister concerned had initialled the relevant file, this need not mean that (i) [s]he had read it, (ii) all the papers in the file were in place, (iii) [s]he had accorded consent to the action taken. The action ultimately taken was based upon notings on the file and had resulted in a huge monetary loss to the state. The persons who carried out the act are of course to be held responsible and must face prosecution, ruled the learned judge.

This line of reasoning is not all that uncommon. Nor is it confined to the judiciary alone. A few years back, two Congress MLAs in Maharashtra were charged with grave criminal offences, such as murder. They were of course promptly expelled from the party, but the party never thought it worthwhile to find out how such characters had got into the good books of its leaders, who recommended their candidature, who whetted their cases and how they came to be adopted by the party. The integrity of the leaders who sponsored such colleagues is taken as above question.

Similarly, when the gigantic stock exchange scam broke out a few years back, the dubious, near-criminal role played in it by senior officials of public sector banks and financial institutions also came out in the open. These prime suspects were all put in their strategic positions by the politicians then in power. Inquiries, even

court cases against some of them, are dragging on and may even come to a conclusion some day. Meanwhile, the political leaders and senior bureaucrats who exercised such poor judgment in the choice of personnel happily continue to serve the country untroubled by either the law or their own conscience. In today's context in India it is unthinkable that the leaders and senior bureaucrats who choose persons of doubtful antecedents for responsible positions will ever be questioned. Moreover, there is also the all-purpose alibi of 'systemic failure'. The interesting part is that despite repeated systemic failures, changing the system is never on any party's agenda. Even the parties nominally committed to revolutionising society are happy playing ball with the establishment.

The latest example of this kind comes from the field of higher education, from Nagpur University. According to reports, a whole clutch of malpractices and criminal activities have been going on in that seat of higher learning on an organised basis for many years. They have come out in the open only now, when a lowly functionary of the university was ready to offer a bribe of Rs 7 lakh to a police official to drop some charges against him. The figure at least brings out the gargantuan scale of the illegal operations sought to be hushed up. Fake degree certificates, duplicate mark-sheets (with marks revised upwards), alterations in the tabulation of results, practically anything could be accomplished in the university office for a price. There was an instance of a student who did not appear for any paper in an engineering examination of the university in the winter of 1991 and yet secured impressive marks in every paper. A public sector corporation wrote officially to the university in 1992 asking it to check the genuineness of university certificates sub-

mitted by some 12 candidates. All turned out to be bogus. The American consulate referred a degree purportedly given by the university for verification in October 1998. It was also found to be fake. But the university authorities found time to file an FIR in the matter only in March this year. These are just a few samples of the goings on in Nagpur University which have come out in the papers.

The state governor, who also doubles as the chancellor of all the universities in the state and thus is formally responsible for their actions, was sufficiently disturbed to make a special trip to Nagpur to look into the matter. The interesting part is that this trip came about this year when, as mentioned above, the public airing of the scandals in the university goes back to at least 1992. An inquiry was indeed held in 1992 and a minor functionary of the university dismissed. But no police case was made then or in the subsequent years, despite the recommendation of the university committee that said, among other things, that "what they investigated was just a tip of the iceberg and a thorough police investigation is urgently required". While at Nagpur, the chancellor accepted the resignation of the vice-chancellor of the university, who "owned moral responsibility for the wrongdoings". He also held a press conference, in which he seems to have made two major points. (i) The university cannot expect a new vice-chancellor immediately because the process of selection would easily take six months or so, and (ii) much of the mischief can be traced to the university rules for reassessment of papers. In other words, a 'systemic failure' again.

The events reported from Nagpur are by no means unique to that university. It was the turn a few months back of Mumbai University where the vice-chancellor in her wisdom increased wholesale the marks of many examinees in a medical examination. Later the chancellor directed the vice-chancellor to rescind her order. Interestingly, in this instance the vice-chancellor did not think it necessary "to own moral responsibility and resign", nor did the chancellor find it necessary to fix the moral responsibility on anyone. The university of Pune has instituted its own inquiry recently into irregularities in its examination results. The situation will be found to be not much different in other universities in Maharashtra or indeed in other states.

Because almost every university under his charge is beset with problems con-

nected with the conduct of examinations, it would be appropriate to check the response to the challenge by the chancellor's office. His actions should be measured against what he can actually do and what is being done in practice. It is sometimes believed that the chancellor of a university is only its figurehead. This is not quite the case. All non-agricultural, non-medical universities in Maharashtra are structured by a common act. This structure has one crucial feature, common to universities in other parts of the country. The state governor is invariably the chancellor of every university and he appoints the vice-chancellor from a panel submitted to him by a committee formed for the purpose, one member of which is the chancellor's nominee and another one of that state government. In other words, the chancellor is involved in the university's affairs right from the time of the appointment of the vice-chancellor. Of late it has become commonplace for the chancellor to even hold interviews of those aspiring for the job.

In addition, in Maharashtra universities at least there are 'chancellor's nominees' on various university bodies, including the all-important management council of every university. There have been rare instances of the chancellor himself presiding over a meeting of a university body. He can ask for information/explanation for any decision of the university and can reverse the same if he feels so inclined, as happened recently in case of the Mumbai University. He is thus not merely a titular head of the university. In fact, through the chancellor's nominees on the university bodies and through the vice-chancellor who is his direct appointee, the chancellor is ideally placed to oversee the working of the university and take timely corrective action. Yet, as the scandal in Nagpur University revealed, not only the chancellor of the university but his nominees on various university bodies had been blissfully unaware of or unconcerned about what had been going on right under their noses, so to say. Incidentally, since 1991 Nagpur has had at least three vice-chancellors, two of them superannuated government officials, who came into the limelight for the alacrity with which educational institutions started by political bigwigs were regularised during their official career. It looks as if as vice-chancellors they did not show half as much speed in tackling cases of corruption.

The other step taken by the chancellor can be termed almost pavlovian. He has

appointed a committee to investigate the matter. It is of course standard practice in India in all walks of life to appoint committees. This is probably even more so in the educational field where committee raj is the norm. The chancellor's committee consists of employees of other state universities, three vice-chancellors who are chosen to their posts by the chancellor and two controllers of examinations who are chosen by the vice-chancellors. The committee has been requested to submit its report in three months.

Only the most optimistic or credulous will expect anything worthwhile to come out of the labours of such a committee and for good reasons. First of all, every member of the committee is a full-time official of another university, each of which is facing almost equally grave problems of its own. To expect them to find time to hold meetings, confer with one another, study the problem and come up with remedies that are both workable and worthwhile and all that in three months betrays total unconcern for the way universities function. It will be a miracle if the committee can meet in full strength even three times in three months. Moreover, to understand the real dimensions of the problem, it would be necessary to check the role of high officials of the university in the scandals. It would be necessary to find out what role, if any, was played by the chancellor's nominees on the university bodies and the vice-chancellors themselves; whether it was a case of the dog that would not bark.

The committee also needs to investigate the way vice chancellors are chosen and the possible acts of omission and commission of the chancellor's office, whether these were procedural or specific and whether better ways cannot be devised. For openness in the administration, it would also be appropriate for the chancellor's office to explain the rationale behind the selection of an individual to a high position, particularly when the person is seen as being overly obliging to the political bosses. It is not realistic to expect that a committee consisting of persons who owe their positions to the chancellor will be ready to delve into such questions even if they have the time.

With one university official having taken his own life, a few others in custody, both the vice-chancellor and the pro-vice-chancellor having resigned and the university involved in criminal cases, it should be clear to anybody that Nagpur University is facing as grave a crisis as any

university is ever likely to face. In the face of this, to say that it is not possible to get a new vice-chancellor for another six months borders on callousness. Doesn't the chancellor feel that there is something drastically wrong with a system which does not allow you to choose a replacement even when faced with an emergency?

There is much that is drastically wrong with the examination system of the universities. The UGC had started with much fanfare, about 20 years back, a campaign for examination reforms. From all accounts, it has by now come to a naught, after spending millions of rupees. The chancellor and his committee might spend some time and check what went wrong with the project. They might also usefully investigate the role of the new educational shops that have sprung up all over Maharashtra and in the areas of all the universities and their role, not only in corrupting the exam system but, even more insidiously, in trivialising the course contents of various degrees. They might also wish to find out why almost all of these institutions are vehemently opposed to displaying their own names on the degree certificates and marks certificates of the student. Surely the chancellor has enough authority under the act to compel the university to display the name of the institution where a particular student studied and was examined. In most cases, the university is only an examining body and the public has a right to know where a student was trained.

Many more such relevant questions can be raised but they cannot be studied in depth, nor can remedies be suggested, in three months. A committee as has been formed by the chancellor holds out no hope that it will come out with anything of substance. Maybe not much is expected of it. By and large, it is true that one should not get bogged down with the *dramatis personae* of the moment while considering long-term reforms. But it is equally true that even a faulty system can be made to work up to some acceptable level with the right personnel. On the other hand, even the best-designed system can be run aground in a brief period of time by a wrong set of people. After all, the present act under which universities in Maharashtra function is only four or five years old. Judging by what has been reported, it looks as if it has been a total flop in solving the problems that face universities. The present ills of higher education in Maharashtra, in fact in all of India, are

certainly to some extent due to systemic faults. But more urgently and ominously, they are also the result of a whole lot of ill-suited persons holding positions of authority in the system.

There is no hope that either the chancellor or the committee appointed by him is ready to tackle any of the serious maladies that affect the working of universities,

least of all the role of the authorities such as the chancellor in creating or aggravating them. The committee's labours will be along well-trodden, predictable lines. It will find fault with some procedural lapses, as the chancellor has already done, hold some minor functionaries guilty, without even raising the questions discussed above.

HARYANA

Change of Government and Beyond

Surinder S Jodhka

While the sense of regional identity has remained weak in Haryana, the state has evolved its own style of politics whose distinguishing feature is its preoccupation with caste. Caste issues will be a determining feature of the forthcoming elections.

THE state of Haryana has the dubious distinction of having given the terms of 'Aaya Ram/Gaya Ram' to the jargon of Indian politics. Not that the culture of defections is confined to Haryana alone or that it began with Haryana, yet the state has acquired a notoriety in political opportunism. Notwithstanding the law against it, defections and opportunistic political alliances have become an accepted part of the Indian political culture. However, its acceptance and prevalence does vary from state to state. In states like Kerala and West Bengal where a large majority of the electorate is polarised on party lines and is often mobilised on ideological issues and programmes, the culture of defections has been less prevalent. While in most other states of India, where the electorate is often mobilised on considerations other than political programmes and ideologies, such as caste loyalties, and where the support structures of different political formations tend to overlap, defections have been rather common.

The recent political developments in Haryana provide an interesting example of the manner in which politics has come to function in India today. The installation of Om Prakash Chautala of the Indian National Lok Dal (INLD) as the chief minister of the state in place of Bansi Lal, who had legitimately come to power three years ago, as the leader of the Haryana Vikas Party (HVP) in alliance with the Bharatiya Janata Party (BJP), might appear as a dramatic development to an outsider. However, to those who have been familiar with the state politics, it was hardly surprising.

The trouble started for Bansi Lal when his party lost most of the seats that it contested during the last Lok Sabha elections. On the other hand, Chautala's INLD won as many as four seats (out of a total of 10 seats in the state). Though the BJP had an alliance with Bansi Lal in the state, Chautala offered to support the BJP-led alliance at the centre. In desperate need of numbers, BJP was only too happy to accept Chautala's offer. Chautala was working with a well-thought-out political strategy. His primary interest was to come to power in the state. He knew that given the political realities of the state, winning the BJP over to his side could be of crucial help if he wanted to form his government in the state. However, it was only in June 1999, when the BJP was reworking its political strategy in the state in view of the forthcoming Lok Sabha elections, that it actually switched its alliance from Bansi Lal to Chautala.

On June 11 the BJP decided to withdraw the support of its 10 MLAs to Bansi Lal's government. However, Bansi Lal could comfortably survive when he was asked by the state governor to seek a vote of confidence on the June 25. Apart from the support of independent MLAs, he could also muster the support of 12 MLAs of the Congress Party. He won the confidence motion with a margin of as many as 22 votes. Though, as it turned out to be, the Congress support was not crucial for Bansi Lal's survival in the confidence motion, supporting the confidence motion created a serious crisis for the state unit of the Congress Party. The faction led by

Bhajan Lal in the state party did not quite approve of the directive from Delhi. The Congress high command claimed that it decided to support Bansi Lal because it wanted to make sure that "casteist-communalist" alliance of INLD-BJP did not come to power in the state and to "prevent horse trading". However, its real intentions were not all that ideologically motivated.

Bansi Lal's government had lately become quite unpopular in the state. He had come to power with the promise of providing 'clean', efficient and development-oriented governance. He had also promised complete prohibition in the state to the women who had been mobilising themselves against the growing menace of liquor consumption in the Haryana countryside. He did impose complete prohibition in the state when he came to power. However, its implementation was far from satisfactory. Not only did the ban on the sale and purchase of liquor promote the boot-legging business and a new breed of criminals in the state, but some of the close associates and family members of the chief minister were also accused of being involved in the illegal import of liquor from neighbouring states and of making huge sums of money in the process.

More recently, he was seen as becoming unpopular for his style of functioning, that many found autocratic and authoritarian, and for having failed to keep his promise of providing uninterrupted power supply in the state. While the World Bank was patting him on the back for having successfully initiated reforms in the power sector, the people of Haryana were beginning to get agitated at the frequent cuts and uncertain power supply. In a state like Haryana where electricity is supplied to every village and irrigation largely depends on the tube-wells, an issue like regular supply of electric power could become a critical political question. In neighbouring Punjab, for example, electric power supply is not only more reliable, it is also available free to the cultivating farmers.

Thus voting in support of Bansi Lal at a time when Congress was all set to encash on the anti-incumbency factor, did not seem to be a very sensible decision on the part of the Congress high command. It also failed to comprehend the dynamics of the Haryana politics. Once it realised its mistake, the Congress asked Bansi Lal to dissolve the state assembly and recommend fresh elections in the state alongside the Lok Sabha polls. However, Bansi Lal

refused to oblige and the Congress withdrew its support in less than a month after it had voted in his favour. Though Bansilal could have survived the vote of confidence on June 25 even without support from the Congress, the latter's decision to withdraw support and suggest dissolution of the assembly created a sense of uncertainty among the legislators belonging to Bansilal's party. Knowing that if asked to go back to the electorate, it could be difficult to get re-elected, most of the MLAs, including those of HVP opposed such a move. In this atmosphere of uncertainty, Bansilal lost his sway over the legislators and a group of 15 MLAs (out of 35) of his party, some of whom were already feeling uncomfortable with Bansilal's style of functioning, decided to defect and form their own party called the Haryana Vikas Party (Democratic).

Once the Congress withdrew its support and the VHP fell apart, Bansilal's government was in minority. After some initial confusion and obvious political manoeuvring, Om Prakash Chautala, the leader of INLD emerged as an alternative to Bansilal. He was sworn in as the chief minister of Haryana on July 24, exactly a month after Bansilal had proved his majority in the house. The Congress ended up doing what it had claimed it wanted to stop when it initially supported Bansilal, i.e., the formation of a government of INLD-BJP in Haryana.

This is the fourth time that Chautala has assumed the office of the chief minister. Though like Bansilal, Chautala too hails from the local landowning dominant caste, the jats, unlike his predecessor or his father, Devi Lal, he is not known as a leader of the masses. In fact, he enjoys a rather dubious reputation of leading short-lived governments. His first term as chief minister lasted less than six months (December 2, 1989 to May 22, 1990). His second stint was only for five days (July 12 to July 16, 1990) and the third time he became chief minister, he had to leave within a fortnight (March 22 to April 5, 1991). His reputation in the state politics is also rather negative.

However, it is not necessary that his performance this time is likely to be a replay of his earlier tenures. Much would depend upon the way his partners in the government act, particularly in view of the forthcoming Lok Sabha elections. The BJP's sole interest would be to get as many Lok Sabha seats for its alliance as it can. Its political base in the state is confined to the urban centres, and on its

own it cannot be expected to get many seats from the state. Accommodating the new ally of Chautala, the VHP(D) into the National Democratic Alliance could be an immediate and crucial question facing the new alliance.

What could be the likely influence of the change of government on the forthcoming Lok Sabha elections in Haryana? Although the state came into being 33 years ago, students of Haryana politics have often argued that it lacks a strong regional political identity [see for instance Chaudhary 1986, Kumar 1991]. Having been formed more as an offshoot of the Akali movement for separate Punjabi speaking/Sikh majority-state than as a response to any regionalist mobilisation, the sense of regional identity in the state has remained weak. Further, it has been pointed out that the local dialect, Haryanavi, has been subsumed in the broader linguistic culture of Hindi, leaving no scope for the growth of a distinct Haryanavi literary tradition.

Whatever the case may be, over the years the state has definitely evolved its own style of politics. Perhaps the most distinguishing feature of Haryana politics is its preoccupation with caste. Nowhere in north-western India, is the discourse of caste as prevalent as it is in Haryana. It has been argued that in Haryana one's caste identity takes priority over all other identities. With the success of green revolution caste consciousness seems to have become even stronger [Verma 1986]. The political strategies here are worked out on caste lines, elections are contested on caste lines, and even political analyses are carried out on caste lines.

Broadly speaking, one could identify four or five caste categories in the state. The most visible caste in the state has been the landowning dominant caste of the jats. Numerically they are around 25 to 30 per cent of the state population. The other landowning castes, such as gujjars, rajputs and rors are each in the range of 2 to 3 per cent of the total state population. Ahirs, another landowning caste, constitutes around 6 to 8 per cent of the total population [as in Verma 1986]. The Punjabi Hindus, who migrated from western Punjab at the time of partition and were rehabilitated mostly in the urban centres of the state, constitute around 28 per cent of the state population. Though they are internally divided, they have come to be recognised as a distinct caste category and over the years they have also learnt to act as a consolidated group in the state politics,

just like the other castes. Apart from the Punjabis, the banias (the traders) and brahmins too have been quite visible in the Haryana politics.

The proportion of the scheduled castes in the state is around 18 per cent. Most of them work as labourers with the landowning jats in the countryside and there is a perpetual conflict between the two caste categories. Similarly, there has been a simmering conflict between the upwardly mobile jats who aspire for urban occupations and the already established urban Punjabis who until recently were called 'refugees' and were seen as 'outsiders' by the 'sons of the soil'.

Notwithstanding his promise of fair governance, Chautala is viewed as an aggressive jat leader who is likely to give priority to the interest of his own community. This feeling is particularly strong among the Punjabis, the banias and the dalits. It is among these groups and a section of the agrarian castes that the Congress has had a social base. A significant proportion of the Punjabis, on the other hand, has been voting for the BJP. In the emerging political scenario in the state, although the Congress appears to have failed in its political strategy, it may still succeed in getting a good number of votes. While being in power might work in favour of the INLD-BJP alliance, it may also provide an issue to the Congress against BJP for supporting a political formation whose track record has not been that of working in the interest of those groups who tend to vote for the BJP in the state. Dalits too are likely to find the Congress more attractive than Chautala's party, provided their votes are not rigged. While the question of who is likely to get more votes from amongst these two political formations (INLD-BJP vs Congress) is still fluid, the political career of the third force in Haryana led by Bansilal seems to be finished, at least for the time being.

[I am grateful to P S Verma and Pradeep Kumar for discussion I had with them on the subject. Errors and omissions, if any, are obviously mine.]

Giving the Soldier His Due

N B Grant

Regardless of everything else, isn't the Indian soldier entitled to social prestige and respect if he is expected to die for his country in the wars the government chooses to fight?

THE Kargil battle has suddenly brought about a countrywide concern for the soldier, who till then was forgotten and taken for granted by a complacent nation. Never since independence, has there been such a spontaneous acclaim for the welfare of the jawan and his family, for which money has been pouring in on a wave of so-called patriotism. People even started giving blood, wrote many of emotional letters, and the media was agog with adulation for the soldier. Although 50 times the Kargil numbers have died in the 1965 and 1971 wars and with the IPKF in Sri Lanka and are still dying in battle-like skirmishes on our borders, they have seldom been highlighted, and promises made to their families, if any, have been long forgotten.

Within three days of the guns of Kargil having stopped firing however, one had to hunt to find the name of 'Kargil' mentioned anywhere in the media, its place being taken up by political wrangling of the coming elections – it is now business as usual. The irony of all this is that, a poll taken only last week, by two national journals indicated that, in spite of the surge for patriotism and a considerable increase in the pay package of the services, only 10 per cent of undergraduates and post-graduates in the country opted for a career with the armed forces.

What is it then that makes a youth join the forces to fight, and in the process willing to die. Studies of wars have amply proved that, ultimately a soldier makes the supreme sacrifice not because he is more courageous or more patriotic than his civilian fellow mate; he certainly does not do it for the army pay he receives or the false promises made to him; even the Army Act does not enjoin him to die; the only reason he dies without batting an eyelid is because he is made to believe that he is a superior citizen, and as such, cannot let himself down in the eyes of the nation, but more so let down the honour of his regiment.

The question therefore arises, as to how this feeling of superiority can be inculcated in the soldier in peace time, so that it becomes a part and parcel of his entire mental make-up and automatically mani-

fests itself during a crisis in battle. No country in the world, including a rich one like US, can afford to pay its military personnel as much as they would earn in industry. However, the civilian society of those countries see to it that the military officer, in spite of his meagre salary, is automatically accepted in the highest of society and the best of clubs, and at no time is his honour and prestige over allowed to be lowered in the eyes of the nation.

Let us illustrate this from some random examples. During the victory in Europe (VE) Day commemoration ceremonies at Hyde Park, London, the prime minister in waiting of the British Labour Party, paid our Indian subedar (Hon Capt) Umarao Singh, VC, the ultimate respect, when he alighted from his car, saluted Umarao, and gave him the right of way, stating, "How can I drive my car ahead of a VC". However, in sharp contrast to this, when our IPKF boys returned Sri Lanka, the then Tamil Nadu CM, leave alone making any attempt to ceremoniously receive them and give them a hero's welcome, went out of his way to slight them.

Again, it is unthinkable that, our president and Supreme Commander of the Forces, has never once paid homage to the unknown soldier at the Amar Jyoti Memorial at India Gate on Republic Day, nor has he, leave alone visited Kargil, but has bothered to even address our troops on TV. In no country is the old soldier

treated with as much callousness as ours. Although idealised in uniform during a national crisis as in Kargil, it is revealing that, a retired government peon is better off than the ex-serviceman, who even today, is not officially entitled to free medical treatment after retirement, which is given to his civilian counterpart.

Finally, if there is one event on which we must hang our heads in shame, it was when two years ago, at the 50th anniversary of the founding of the UN, at a function held at Sapru House in New Delhi, after several foreign and Indian dignitaries had spoken, it was left to a UN British representative to ask the audience to stand in silence in tribute to the seven Indian medical personnel killed in Somalia. There can be no greater shame, than for our erstwhile rulers to remind us to venerate our own service dead.

Nothing will inspire men to take to the profession of arms and make the supreme sacrifice except political leadership, which is prepared to place the 'izzat' of the soldier as the foremost battle winning factor. Whereas all other countries, including Pakistan, have gone out of their way to foster this feeling, our country has still not grasped the significance of the word 'izzat'.

In another emergency like the present one in Kargil, the Indian soldier will again gladly make the supreme sacrifice to safeguard the security of the nation, as he did in the two previous wars with Pakistan and also in Sri Lanka. The nation in turn owes it to the soldier to give him a place of honour in peace, but much more than that, to enhance his social prestige in the eyes of the nation. If we want the better type of youth to take to the profession of arms as he once used to, and be prepared to die for his country as he did at Kargil, we must create conditions of honour and prestige for the armed forces.

Signpost. Issues that Matter

Riding the Nuclear Tiger

N. RAM

Demy 8vo, pp viii + 120, hardcover Rs 175, paperback Rs 60

By exploding five nuclear devices on May 11 and 13, 1998 at Pokhran, the BJP-led government hijacked India's independent, peace-oriented nuclear policy and twisted it out of shape. N. Ram (Editor, Frontline), drawing on scientific inputs and assessments from physicist T. Jayaraman, assesses the reasons and implications of this move in a manner accessible to both the interested layperson and the specialist.

US Steel Crisis: 'Free Trade' Dumped

A S Firoz

It is interesting that all through the recent steel crisis in the US, government agencies and politicians alike, all otherwise strong votaries of free trade, were emphatically seeking measures quite in contravention of WTO agreements.

EVERY steel crisis wrecks havoc in America's ideological framework. It has happened this time also as the industry and the government agencies went all out to protect and support the US steel industry that suffered, like many others in the world, from an unprecedented crisis starting mid-1998. On the one hand, the US industry and the government could not depart from their strongly and oft articulated pledge to free trade, while on the other found a major industry being washed out in the deluge of cheaper imports.

In 1998 the US was the strongest steel market in the world accounting for a consumption (represents apparent consumption and not actual consumption) of over 119 million tonnes of finished steel products.¹ In fact, the US market was growing steadily over the past few years as seen from a 20 per cent increase in consumption recorded over the period 1995-98. During the same period, the global consumption increased by only 5.5 per cent. In 1998, when the US consumption was up about 6 million tonnes, the same globally was down 7 million tonnes.² Imports of steel into the US soared to a record high from 28.3 million tonnes in 1997 to 37.6 million tonnes in 1998. Against this, US crude steel production grew only by 3.4 per cent during 1995-98. In 1998, in fact, production fell marginally in the face of the massive surge in imports (*Report of World Steel Industry*). The situation is worse in the first half of the current year as the US steel production dropped 9.3 per cent from that in the same period last year compared to a global drop of 4.6 per cent (*IISI Monthly Report*, July 19, 1999).

The US steel industry naturally suffered the most when it should have prospered. Strong growth in steel demand was possible because the US economy had a dream run – growing strongly for several years now. The unprecedented growth was, however, marred by internal conflicts of interests. The strong dollar and the crashing currencies in Asia, CIS and Latin America led to an increase in US imports making many domestic industries fight for their survival even on an expanding

market. Steel was one such product that saw cheaper imports hitting the US producers hard. As competition brought down prices, the steel companies saw their bottom lines crash. "We are in the midst of a crisis that poses an unprecedented threat to our steel companies. At stake are thousands or more steelworker jobs and millions in lost revenues, both of which affect the stability of families, communities, major steel-using industries, stockholders, and consumers", said American Iron and Steel Institute. (American Iron and Steel Institute, website, www.steel.org.) For the US steel producers, there were reasons to panic. They claimed that the "US steel industry is an outstanding example of an industry that has reinvented itself to become a world-class competitor". According to American Iron and Steel Institute (AISI), 50 billion dollars have been invested on modernising the industry to make it globally competitive. The industry brought in state-of-the-art plants and machinery and took the best in technology available in the recent period.

They were right. But, that was exactly what had happened in many countries. The collapse of the Asian and Russian economies threw 33 per cent of the world's steel capacity into deep trouble as their home markets and traditional export markets virtually disappeared. The global prices dropped by as much as 30-40 per cent in the course of a single year (1998). Interestingly, by co-incidence or otherwise, some of the worst hit economies were major steel producers – South Korea, Japan, Brazil and the CIS countries. Also affected were those economies which had bought a lot of steel from the world market prior to the crisis, say, south-east and east Asian countries. Therefore, on the one hand, the trouble-torn economies had less steel to buy and on the other in many cases more steel to sell. While many economies tumbled and steel demand there fell to the rock bottom, the US and western Europe continued with unprecedented hunger for steel. As a result, steel exports changed destinations and direction. Asia that used to swallow a huge quantity of steel earlier, much from western Europe, turned a net importer and European Union, a tradi-

tional net exporter turned net importer. US, a favourite of all steel exporters, saw steel crossing its borders from all directions. Imports increased mainly from Japan (by 163 per cent in 1998 over 1997), Russia (59 per cent), Korea (109 per cent), Australia (117 per cent), South Africa (106 per cent), Indonesia (496 per cent) and India (94 per cent). As against this, the traditional exporters of steel into the US either faced a drop or managed only a marginal increase – EU (-4 per cent), Canada (3 per cent), Brazil (-4 per cent), Mexico (-4 per cent) and Turkey (-14 per cent) (Data released by US Department of Commerce, AISI website). For the US steel industry, apart from a sheer increase in volume imported, the new sources of imports were a big concern. The increase in imports in 1997 did not make the US worry much as both the world and domestic prices were higher than those in the previous year and the industry as a whole was all set to make good profit, as in fact it did. The operating profits of the major US mills rose from about \$ 33 per tonne in the first quarter 1997 to about \$ 40 per tonne in the second to finally slip back to \$ 34 per tonne in the fourth (*Steel Strategist*, World Steel Dynamics, June 1998). The situation was going from bad to worse day by day in 1998 as the impact of the Asian crisis came to be felt on the steel industry. Global prices continued to fall in the first half of the year. But, strong domestic demand still kept the US industry above the danger mark. The turn of events in the second half of the year was not only unexpected but also beyond anybody's imagination.

But, so strong was the US market that the US domestic prices remained significantly higher than those in the world market for a long time after imports started to increase at an alarming pace. The US market responded slowly to the drastically changing conditions elsewhere in the world. In the second half of 1998, everybody was aware of the rise in imports but nobody really knew how much of steel was actually hitting the US shores. The magnitude of the problem could not be assessed. The commerce department admitted lag in collection of import figures. They also decided to make special efforts to bring out the import figures by the last week of the next month. Imported steel piled up in every port. By the time the real quantum of imports was ascertained, the damage was already done. Domestic prices dropped sharply on a 'death spiral'. The outcome was predictable. Stiff competition left the domestic industries scurrying for support as their survival was threatened

INDUSTRY RESPONSE

As in the past, the industry rose to its defence with massive political support. Full page advertisements appeared in major American dailies. 'Stand up for steel' was the call of the industry asking for government support and protection. "What we need is an effective global solution to America's steel trade crisis", said AISI's president and CEO Andrew G Sharkey, III (*USA Today*, April 14). Lobbying became intense and the US Congressional Steel Caucus made hue and cry in every possible quarter. A house resolution called for a ban on imported steel (The Bipartisan Steel Recovery Act (HR 975)). Many others were moved either to seek restriction on imports or for financial support for the industry.

The reason why the US steel industry became restless was that in the last few years, the industry had invested heavily not only on acquiring modern technologies but also in setting up hi-tech greenfield plants. The new run of investment had followed a tortuous path of restructuring that had seen a large number of steel producers becoming a part of history. This time, much of the expected success from these investments depended on the continued growth of their home markets and competitiveness of the new industry. The first being already ensured, the efforts of the industry was to achieve global efficiency in production. This would have been there in the normal course of time and the US industry largely would have remained profitable in the foreseen future. But the sudden loss of market and competitiveness (due to strong dollar mainly) threatened the industry not only with red ink in their accounts for a year or two but more strikingly with the prospect of many companies going totally bankrupt under some heavy financial strain. The threat bankruptcy loomed large on even some of the most modern and competitive producers. It is an irony that the US steel industry fell into one of the deepest pits when the domestic demand in the country was at its best in several years. It was a year that the domestic industry would look for a killing. Such opportunities come once in a while only in an industry known for its cyclical ups and downs. Therefore, the expectation of the industry was sky high and reasonably so.

In the campaign to defend the US steel industry, also was recognised the importance of the industry in the country's economy. Those who did, never hesitated to tell others that steel was a global commodity, available everywhere and that

every country need not make efforts to produce it, went on to say, "The ultimate victims would be US consumers. Not one of the world's leading industrial nations can function effectively without the ability to produce steel. It is fundamental to a successful economy. Are we willing to give this up to help the economies to Russia, Japan, Korea, and China? We are sympathetic to other countries' suffering, but we cannot solve their problems at the expense of American steelworkers' jobs and at the risk of losing the world's cleanest and most efficient steel industry." The US steel industry called the imports as 'illegal', unfairly traded, dumped and subsidised. The industry sought tough actions as quickly as possible.

As had happened in the past, the reaction of the US government to the ensuing crisis was at best a bundle of ad hoc actions far removed from any determined and well thought out trade policy. The US department of commerce issued one statement after another expressing concern over the increase in imports of steel. The government took a strong posture. While admitting that the steel crisis was the result of economic and financial crisis elsewhere in the world, commerce secretary Daley said "We at the department of commerce strongly support an open global economy. However, I made clear...that I will not stand by and allow the US to be a dumping ground for struggling foreign economies. I will not stand by and allow US workers, communities and companies to bear the brunt of other nations' problematic policies and practices. We are the most open economy of the world. But we are not the world's dumpster" (William Daley, reported by AISI on its website). He said further "We...will use every weapon at our disposal to ensure that our essential US industries, like steel, and the workers of those industries, are not jeopardised by foreign unfair trade practices. We will enforce our trade laws as vigorously and as expeditiously as possible." The government thus assured the industry in no uncertain terms that action would be taken on the trade cases if filed, even before the same were filed and thereby encouraged the industry to do so.

The US government's concern about the industry's plight was genuine and well founded. The reasons were political as much as economic. The steel industry in America has always been known for its strong political lobbies and in the past had seen massive social and political outbursts as steel mills closed one after another falling to increased global competition (*Steel and the State*, Howell,

Noellert, Kreier and Wolff). Nobody wanted that to recur. But, there were not many options. A WTO member country strongly declaring its commitment to free trade could not either bring in quantity restriction or import duty hikes. The government also had to see the interests of the steel user industries. When the steel industry asked for protectionist measures the user industries countered it by saying that expensive steel would make them globally non-competitive. The closure of their industries and reduction in external steel trade would lead to much larger unemployment and widespread economic disturbance. Caught between these two, the US government had to tread with caution.

The US government on the one hand gave a clear signal to the industry that they could expect favourable response in any future or ongoing cases by declaring that dumping had affected the US steel industry before any investigation was carried out and on the other made it clear that demands such as the one for an outright ban on imported steel would not be appreciated. The house resolution calling for a ban on imported steel was blocked in the Senate before it could reach Clinton administration. The senate has sat indefinitely on many other house resolutions pressed in to benefit the steel industry. Some of these include bail out packages for companies facing this financial turmoil in the form of bank loans and government guarantees for loans from private banks. The Clinton administration was visibly uncomfortable with such proposals as any action in the line proposed would violate the country's commitments to the WTO. But, as promised, the government took quick, tough and effective action against imported steel as settlement of anti-dumping and countervailing cases. Unlike in the past, when the mortality rates for steel dumping cases used to be high, almost all cases filed in the recent period, especially after the onset of the crisis, saw results. The industry had avoided filing useless cases and had their eyes well set on the potential danger countries and products.

Massive anti-dumping duties were slapped on hot-rolled coils from Japan, Russia and Brazil. Japan, sensing the futility of exporting to the US markets when anti-dumping duties were imminent, reduced their exports. The Japanese government and industry had rounds of talks with US counterparts to somehow diffuse the situation. But, nothing happened despite their unilateral decision to cut exports. Russia and Brazil also did their best to get out of the trouble. Both these

countries are now left to accept product-wise quota, floor prices and moratorium on exports to the US under suspension agreements in lieu of anti-dumping duties.

Even though on paper the suspension agreements were not unilateral coercive actions of the US government on the other party, there are interesting elements to be seen in those which reflect the muscle used by the US authorities. The agreements were not between the industries in each country and were opposed largely by the industries in these countries. The most striking feature in each of the agreement was the element of floor prices, set much higher than the prevailing prices. For example, the revised suspension agreement puts a full stop to imports of hot-rolled coils from Russia for the rest of the year. Then there is a floor price set at a level much higher than the best price Russian mills can expect in the current market. The question is if there is not to be any import then why set a floor price for this product now? For Brazil, the moratorium on imports of hot-rolled coils (into the US) is up to the end of September. Then there is the floor price of \$ 327 per tonne, perhaps c and f (not explicit in the statement issued by the commerce department but presumably so). There is the added condition, if the steel prices rise, the floor price will be revised and under no condition could the Brazilian price be more than 6 per cent lower than the US 'reference' price. If the reference price is to be worked out on the basis of 'list' prices of major mills then that would be set naturally at much higher level than the actual price as it will not take into account the discounts on the list prices. In certain cases, discounts can be anything between 10 per cent and 20 per cent. This practically means that there will not be any import of these products in future as no sensible buyer will be paying more for the Brazilian product. This is really 'free trade' and 'competitive' US policy!

Brazil or Russia perhaps did not have any option. Russia not being a member of the WTO could not even question the US decision to impose anti-dumping duty as high as 217 per cent in any forum. At these rates of dumping duty there was no possibility of any Russian hot-rolled coils getting sold in the US markets. Therefore, every other scheme that had given them at least some chance of maintaining their presence in this huge market was acceptable to them. They in fact agreed to have lower import quota for hot-rolled and cold-rolled sheets in exchange of higher quota for slabs and other products. Interestingly, in the first suspension agreement, the quota

for slabs was fixed so stringently that it was the US industry that led the protest. Reason is simple. A large number of US mills depend on imported slabs. They will be out of the market if the flow of Russian slabs stops. Similarly, a large number of mini mills have threatened legal action against imposition of quota on pig iron – a raw material for them. Brazilian producers also had similar problems. They will have to restrict hot-rolled coils and will have to concentrate on other products not in conflict with the US industry like slabs and billets again.

The US government thus eliminated major potential competition in their home market. Although the suspension agreement, especially with Brazil is being questioned at various circles as WTO member country governments are prohibited in general from signing voluntary restraint agreements, the US government has tried to link everything to the already established dumping cases and thereby get legal sanction for all its actions. Comments on and analysis of the validity of these actions may go on and on. But, the damage in full course has already been done and the US industry has got its much sought-after protection at the end of the day.

Interestingly, in spite of such strong support from the government, the US industry did not look satisfied and happy. Such was the expectation of the industry from the government that every government action over the entire crisis period was considered grossly inadequate and not strong enough." As an unapologetic free trader, I am disheartened by Clinton's unwillingness to enforce our trade laws. It is our advantage to trade with other nations, but this trade must be fair and in accordance with existing laws and treaties. While Clinton is looking at Wall Street, folks in Sparrow's Point, Maryland are looking for work" said Robert L Ehrlich, Jr (*American Metal Market*, March 30).

American Iron and Steel Institute left no stone unturned to propagate the steel cause. The steel industry even strongly opposed the suspension agreements with Brazil and Russia calling both compromises and concessions given to foreign steel. They feel that the agreements do not provide long-term and stable protection to the industry (CH Barnette, chairman and CEO, Bethlehem Steel, quoted in *American Metal Market*, July, 13).

The US industry today stands divided and confused as far as the suspension agreements are concerned. They wanted specific and well targeted product and country-based anti-dumping and countervailing actions. They fear that suspension

agreements do not have the same legal standing and sanctity as anti-dumping. The anti-dumping actions, once imposed, stay for five years before a review is undertaken for further continuation. In the US, history shows anti-dumping duties remaining in force for much longer period. Of course this was possible in the past as the US trade law did not have a sunset clause for anti-dumping actions. In effect, the US industry wanted a permanent downing of shutters for foreign steel. They were also perhaps sure that as happened in the past the reviews could always be shaped in their favour. As against this, the alternative arrangement does not have well-defined life and will be subject to various political pressure. Then the problem of inclusion of feed and raw materials in the agreement that go against the industry remains unsolved. There is another fear as well in case the agreements are called illegal by any US court of law, what will happen to the anti-dumping cases?

During the entire 1998-99 steel crisis many government agencies and politicians, otherwise strong votaries of free market, forgot what they had all along cried for and asked for measures totally in contravention of even WTO agreements. This time they did not really want to get into the debate on principles of trade. They wanted immediate action all that is possible, within the framework of law of course. "The low cost, highly competitive US steel industry has supported virtually every initiative to liberalise trade in recent years. Accordingly, this is not a 1980s debate between 'free trade' and 'protectionism'. Our restructured revitalised steel industry doesn't need 'favours'. What we need but do not have is fair, rule based, two-way free trade" (Andrew G Sharkey III, *USA Today*, April 14). Survival first – ideology may follow! But, this was not something new for the US especially in the history of its steel industry. This is one industry that has always thrown up issues that shatter the free market ideology to fragments. The US will remain at best the self proclaimed defender of free trade till such a time as its own interests are best served.

Notes

- 1 Estimated by International Iron and Steel Institute, Brussels, 1999. Apparent consumption = production - exports + imports. Variation in stock is not accounted for.
- 2 The intensity of the global steel crisis is appreciated better if one takes into account the actual consumption of steel during the year considering variation in stock. The drop in 1998 in actual consumption of steel in 1998 from that in 1997 has been estimated by the author at about 25 million tonnes.

Reflections on Post-Mandela Era

Vishnu Padayachee
Imraan Valodia
Thokozani Xaba

Now that he is president, will Thabo Mbeki be able to stick to the fundamentals of the growth, employment and redistribution (GEAR) macro-economic strategy widely known to have been authored by him in his effort to speed up the delivery of development to the poor? And if he does, will GEAR still receive support from market players worldwide?

IN his after-dinner speech on the day of the inauguration of Thabo Mbeki as South Africa's second democratically-elected president, former president Nelson Mandela, observed, not for the first time, that his former deputy had been the de facto leader of the country since 1997. Mbeki had been a high-ranking member of the ANC for many years; for sometime he headed its international affairs department in exile; he was arguably the key ANC figure in the pre-1990 meetings with 'verligte' (enlightened) Afrikaner academics and politicians and (English and Afrikaner) businessmen; and he has been publicly identified as the force behind the formulation of the ANC-led government's growth, employment and redistribution macro-economic strategy (GEAR), which was well received by market players worldwide.

So Thabo Mbeki is no obscure figure. Yet, as South Africa's second democratic elections loomed, a variety of issues and questions about the man who, as ANC president, was about to move into the presidential suite at the Union Buildings in Pretoria, continued to occupy the attention of his political opponents, commentators, market players, and the like. Central among these were:

– Will the ANC under Mbeki win a decisive-enough electoral victory, one at least close enough to that achieved under the nationally and internationally revered Nelson Mandela in 1994?

– Will the ANC win a two-thirds majority in the elections? A two-thirds majority would allow a party to change some aspects of the constitution, including for example, the independent status of the South African Reserve Bank. Some opposition parties based their entire campaign around the call to stop the ANC from winning such a majority. Some economic analysts also argued that 'markets' would be 'happier'

if the ANC did not gain a two-thirds majority.

– Will Mbeki be inclined to centralise power in his office, so threatening the process of deepening and consolidating South Africa's still maturing democracy? Concerns were raised in some reports that he may rely increasingly on an inner circle of trusted friends in making crucial decisions, so bypassing democratically-elected structures.

– Will Mbeki stick to the fundamentals of GEAR (as business wanted) or change economic policy (as some in the unions wanted) in an effort to speed up the delivery of development to the poor and the marginalised, an objective that he has emphasised repeatedly as central to his presidency?

– Will the ANC under Mbeki increasingly focus on a project of Africanisation via means that would threaten so-called minority (whites, coloureds and Indians) rights and so undermine the still fragile, non-racial character of South African society?

These were the key issues that were raised in the run-up to the elections. They are arguably the issues around which any future assessment of Thabo Mbeki's presidency will be made.

ELECTION RESULTS

South Africa's second democratic elections, for both the National Assembly and nine regional assemblies, took place on June 2, 1999. Despite concerns about the adequacy of the resources available to the Independent Electoral Commission to conduct and manage the elections, the entire process went off reasonably well. Enthusiasm among the electorate, going by the high voter turnout, was significantly higher than many pollsters had predicted. Some 80 per cent of the eligible population are reputed to have registered and about

75 per cent of these actually voted. Levels of violence, even in some volatile areas in the KwaZulu-Natal (KZN) midlands, were noticeably low. The electoral process was judged to be free and fair by international observers, and the results were not disputed (in any significant manner) by the political parties. All these factors suggest a growing level of maturity in South African politics.

The election outcome in brief was as follows: the ANC won 66.35 per cent of the vote for the National Assembly, as against 62 per cent in the last election. In proportional terms it not only maintained the support of the black majority, but increased it. However, the ANC fell fractionally short of a two-thirds majority. It received the highest support for the National Assembly in Mpumalanga province (85.26 per cent), and its lowest national support in KwaZulu-Natal province (39.77). The Democratic Party (DP) by gaining 9.56 per cent of the vote ousted the New National Party (NNP), the party of FW de Klerk (now retired), from the role of official opposition. It received its highest national support in Gauteng (around Johannesburg and Pretoria). Chief Buthelezi's Inkatha Freedom Party (8.58 per cent) surprised many by coming third in the National Assembly, with the NNP (6.87 per cent) in fourth place. A variety of smaller parties made up the rest.

At the provincial level, the ANC won seven out of the nine regional assemblies. Although it won the largest share of the vote in the western Cape (42 per cent), the main opposition parties (the NNP and the DP) succeeded after difficult negotiations, in forming a coalition government, so relegating the ANC to the opposition benches. The ANC despite its large share of the regional vote, ended up with no representation on the regional cabinet. The ANC's trade union allies immediately organised a march in protest against the perceived 'ganging up' of the opposition parties to prevent the ANC from being a major partner in the regional government. Continued mass action against the NNP-DP government was threatened.

In KZN, the IFP gained a slender lead over the ANC, although neither party achieved an outright majority. While there appeared to be agreement that these two parties would form a coalition government to run the province, questions about whether or not Buthelezi would accept the national post of deputy president in exchange for an ANC premier in KZN; who, if the IFP was to lead the government, would be premier; whether the regional capital would be in Ulundi (as the IFP

wanted) or Pietermaritzburg (favoured by all other parties), all combined to initially stall negotiations. In the end, following the president's decision to appoint an ANC person to the deputy president (and not Buthelezi), the ANC withdrew its nomination of Shu Ndebele for KZN premier in favour of Lionel Mtshali. The regional cabinet posts were split six to four in favour of the IFP, although this may only be a provisional distribution.

Let us now look more closely at a disaggregated picture of the election results. In the realm of what, for analytical purposes, one may call 'Black politics', the election clearly consolidated the power of the ANC and relegated most other Black political movements to the backwaters. Liberation movements such as the Pan African Congress of Azania (PAC) and the Azanian Peoples Organisation (AZAPO) which, like the ANC, were accorded special status in many global forums in the years of struggle, were shown to have no real support base. These parties, as well as the Socialist Party of Azania (SOPA) with their left-wing ideology (or rhetoric) and Black consciousness history, have been all but wiped off the political stage. They have, it seems, failed to make the shift from liberation politics to mainstream parliamentary politics.

There are, however, small pockets of support in both urban and rural areas for other Black parties – former Transkei homelands leader, Bantu Holomisa's UDM polled a little more than 50 per cent of the vote in his 'home town', Umtata; the IFP, having been astute enough to bring the combative Lionel Mtshali back from the national stage to lead the party in KZN exceeded the predictions of most pollsters, who suggested that it would not get close to winning the province; in the remote north-west province, another 'apartheid dinosaur' the former Bophutswana homeland leader, Lucas Mangope's relatively new United Christian Democratic Party, did well enough to become the official opposition in that province.

In KZN, the overtly Indian-based Minority Front, led by yet another figure from the apartheid past, Amichand Rajhans (at one time leader of the 'Indian chamber' of the detested Tricameral parliament under former presidents P W Botha and F W de Klerk) did well enough to win a seat in the National Assembly for the first time. The party immediately and formally allied itself to the ANC, in this way giving the ANC the extra national seat it needed to achieve a two-thirds majority in the National Assembly. Its two seats in

KZN regional assembly gave the ANC an equal number of seats as the IFP, so trumping the latter's chances of automatically assuming the lead role in the new provincial government.

Among White voters, the rise of the Democratic Party under the leadership of Tony Leon and the shift away from the NNP has been the most important development. The Democratic Party, ostensibly the heir to the 'liberal' legacy of Helen Suzman and the old Progressive Party, which fought a lonely struggle within the framework of the old parliament, rose from the ashes of the 1994 elections to oust the NNP from the status of the official opposition. However, it did so on the basis of a radical free-market economic ideology and a political message (moulded around its 'Fight Back' slogan) so far right of centre that it succeeded in attracting traditional NNP votes and even far-right Afrikaner support in some parts of the country.

The DP also made inroads into NNP and arguably even ANC support, among Indian voters in some areas. It did this mainly by successfully exploiting working class and lower-middle class Indian minority concerns about the 'dangers' of the ANC's affirmative action policies. But the DP failed miserably to win any significant support within the African majority population, and despite its 'success' its future under its present policies and leadership style, appears to be very uncertain. The NNP appears to have paid the price of pursuing a racially-inclusive politics, something that appears not to have gone down well within the conservative segment of the White electorate.

Another significant development within White politics (as it were) which emerged from this election was the poor performance of General Constant Viljoen's Freedom Front (FF), a party whose main aim is to protect Afrikaner rights. Although smaller and newer parties operating within the same framework and philosophy, like the Afrikaner Eenheidsbeweging (Afrikaner Unity Movement) and Louis Luyt's Federal Alliance managed to win one seat each in the National Assembly, the 'threat' of a right-wing Afrikaner revolt against the new regime, which occupied so much of the attention of foreign journalists and diplomats in the run-up to the 1994 elections, has all but disappeared. The threat which ran through the very heart of White South African politics for most of the 20th century, i.e., Afrikanerdom and Afrikaner nationalism,

has, in the space of five short years, been sidelined, even smashed.

So where does all this leave opposition politics in the next five years? Despite its growth the DP is small and appears to have a limited appeal in the Black community. The main opposition to the ANC is likely, as has been the case since 1994, to be from within the ANC alliance itself. As the policy process unfolds, tensions within the ANC-led tripartite alliance may rise. Already, the South African Communist Party (SACP) has publicly been critical of Mbeki's attempts to develop a closer relationship with the IFP, long regarded by those on the left of the movement, and by most ANC supporters in the IFP stronghold of KZN, as a mortal enemy. Mbeki's economic policies are unlikely to differ in any substantial manner from those out in the 1996 GEAR document, which some economists have labelled as 'neo-liberal'. Failure to make any inroads to growing unemployment may well heighten tensions in the new government's relations with COSATU and the SACP. Whether or not a socialist alternative to the ANC emerges from within the ranks of the alliance or not remains unclear. Many commentators would argue that Mbeki has the strategic and political skills to outflank his left-wing allies, as he has in fact done with great skill over the last few years. The fact that GEAR remains the centrepiece of ANC economic policy, despite the hostility of internal opposition to it, is testimony to his skills and his determination.

The election results showed that, in spite of five years of nation-building and reconciliatory politics, racial politics remains critical in democratic South Africa. This is evident, for example in the DP's campaign which exploited racial fears and succeeded to some extent. However, one should be careful not to make the claim that people, groups or communities voted in racial blocs. The reality is much more complex and class and other considerations have to be taken into account. For example, the 'Indian vote', was split among a number of parties. In the more affluent 'Indian' suburbs the ANC did receive very significant support (43.57 per cent in the Reservoir Hills Secondary School polling station; and 57.56 per cent in the Moberi Heights Muslim Society polling station). However, let us look at what happened in three 'Indian seats' in Phoenix, which is a sprawling, almost exclusively working class area. At one polling station (Phoenix School) the DP polled 54 per cent of the vote, the ANC 18 per cent and the NNP

6 per cent. At another Phoenix Heights, the DP polled 33 per cent, the ANC 14 per cent and the NNP 26 per cent of the votes. At the third Phoenix Technical School, the DP polled 29 per cent, the ANC 29 per cent and the NNP 14 per cent of the votes. So even in a relatively homogeneous area (by race and class) results differed markedly from one polling station to another. The growth of large, mainly Black, informal settlements contiguous to middle class and upper-middle class suburbs (previously either Indian or White) may be one complicating factor. We would surmise that the now changing racial and class geography of a city like Durban will continue to confound those trying to make sense of election results on simple race-class lines.

Unlike trends in Europe and some parts of Asia, issue and religion-based politics remain peripheral in South Africa. On economic policy there appeared to be little difference among the major parties, with speed and efficacy of policy implementation, the only point of difference. The poor performance of environmentally conscious parties such as the Greens and the religious parties (with the partial exception of the African Christian Democratic Party (ACDP) in the Western Cape) also attests to this. Other religious-based parties such as the Muslim Party which contested the 1994 election did not contest this time. The little known Islamic Convention movement unsuccessfully attempted to persuade Muslim voters to stay away from voting at all, as a form of protest against what it regarded as the injustices of the new society and political system.

IMPLICATIONS FOR DEVELOPMENT AND DEMOCRACY

The character of Mbeki's cabinet shows a commitment to redressing gender inequality at the highest level of government, as well as to the delivery of development and social and economic infrastructure, especially to the poorer sections of the population. On the first point, the number of women that have been appointed as ministers and deputy ministers has increased sharply. Eight of the 27 cabinet ministers are women (previously four), while eight of the 13 deputy ministers are women (previously four). The most senior of these is the new foreign minister Nkosazana Zuma-Dlamini, formerly health minister. Illustrative of the second point is the dropping of Pallo Jordan, the previous minister of environmental affairs and tourism and

highly-ranked in the ANC, from the Mbeki cabinet, ostensibly for failing to develop any coherent tourism policy, an area seen as critical for job creation.

On economic policy, no one should remotely expect any public announcement of a backtracking from the macro-economic framework, GEAR, although some changes around the edges may happen without much ceremony. In the press conference to announce his new cabinet, Mbeki made it clear that current "economic policy is very correct", and that he does 'not visualise any changes' to it. This stance was buttressed by the reappointment of Trevor Manuel to the finance ministry and of Alec Erwin to trade and industry. Both are highly respected nationally and internationally and represent continuity and certainty in a potentially volatile global context. The 'market' will no doubt be closely watching the reappointed labour minister to detect signs of support for its position that labour markets should be made more flexible, as a precondition for job creation. It will be watching the new minister of public enterprises for a speedier implementation of the government's privatisation programme. Foreign and local investors, as well as ordinary citizens will be hoping that the

tough-talking, former sports minister Steve Tshwete, will do enough in his new job at safety and security, to reverse the escalating crime rate, and the growing sense, especially internationally, that South African society is being rapidly criminalised. From August 1, markets will be closely monitoring the Reserve Bank's conduct of monetary policy, under the new governor, Tito Mboweni, to ensure that he sticks to the orthodox monetary stance of his predecessor.

However, it must be emphasised that unless investment, both foreign and local, and both private and public, picks up noticeably, there is little prospect that the growth and employment projections of GEAR will come close to realisation. Although GEAR does project a sharp increase in government investment expenditure of 16.7 per cent in 2000, it is debatable whether this will be adequate to re-align actual growth and employment targets with GEAR projections. The South African economy has technically slipped into recession, and there will be great pressure on the new government to deliver on its promises to the poor and the disadvantaged, as long as this situation continues. The debate over economic policy in post-

SOME CHALLENGING BOOKS

by Paramesh Choudhury

1. **Kashmir to Palestine - Rs. 480.00, P. 380**

Jesus escaped from the Cross to India. Later, he died in India, his ancestral land, where he spent 14 to 30 years of his life, to get lessons on Indian philosophy and religions.

2. **The Aryan Hoax - Rs. 490.00, P. 450**

Know the Truth, speak the Truth!

UNESCO says: 'To speak of an Aryan 'race' or 'people' is a mere myth'. Vivekananda remarked, 'All these monstrous lies are taught to our boys!' Vol. V, P. 537

3. **The India We Have Lost - Rs. 280.00, P. 248**

This is an anthology of essays taken from the Asiatic Researches (1775 to 1804). Discover the India which the British convinced us, did not exist. That India colonised and civilised Greece, Egypt and Mesopotamia, that India was the paradise of the Bible.

4. **N. E. India - The Cradle of the Chinese Nation - Rs. 590.00, P. 625**

Sir William Jones wrote that the Chinese are of Indian origin (Asiatic Researches, Vol. II). The author carried on extensive research to trace out the full history of India's great achievement.

(Mahabodhy Book Agency - 4A, Bankim Chatterjee St., Cal-700 073).

apartheid South Africa has been dominated so far by neo-liberal economists and proponents of a World Bank/IMF philosophy. If economic policy based on these notions fail, an entirely new dynamic, and a new set of economic ideas may yet enter the arena of South African politics and economic policy formulation, stimulated by bold new economic thinking emanating from some divisions of the World Bank, and from various sources in Asia.

What are the implications for democracy and development of what appears to be an increasing centralisation of power in select networks around the new president, and of formal power in the new office of the presidency? Concerns about Mbeki's record as deputy president of setting up structures outside the formal governmental, parliamentary and party system, where key policy issues are debated and discussed, have been raised previously. One example of this is the so-called, black caucus, a grouping of black business leaders and academics, who meet Mbeki at regular intervals. In the South African press, parallels with the notorious *Broederbond*, so critical in the shaping of apartheid policy under the Nationalists, have been raised, although this has been challenged by some insiders and commentators as being an inappropriate example.

All indications are that the president's office, restructured in line with the recommendations of the Presidential Review Commission, will be instrumental in shaping and driving the trajectory and implementation of future policy. A new full minister (Essop Pahad) has been appointed in the presidency. Pahad is a close and trusted friend of the new president, and their association goes back, at least, to the time of their student-days at Sussex University in the early 1960s. Pahad's ministry will in the future be more decisive in the formulation, development, co-ordination and implementation of policy. Reports suggest that Mbeki's office is likely to conduct a thorough assessment of other ministerial policies before they are put to the cabinet for approval. This follows the example of a number of other countries where a central policy co-ordination unit is located in the highest political office.

Whilst this sort of policy co-ordination may well improve the content and implementation of policy, there are fears in some circles that this process may impede debate about the country's policy direction, and more importantly, shut out dissenting

policy views. A further related development that is a matter of some concern is the recent changes in Public Services provisions which give ministers wide ranging powers to appoint and dismiss staff in their departments, and also give ministers a direct say in the internal organisation of government departments (*Saturday Star*, June 12, 1999). However, if the new structures work, i.e. if greater policy co-ordination occurs and a sense of urgency is brought to bear on the implementation of policy, and this results in the speedier delivery of social services, infrastructure and development to the poor and the disadvantaged, then the price (in terms of the implications for the liberal democratic project) may not be regarded in other circles, as being too high.

'AFRICAN RENAISSANCE'

A feature of Mbeki's presidency is likely to be the further articulation and implementation of his vision of an 'African Renaissance'. In practice, this will probably be translated into Mbeki, and South Africa, playing a more defining and visible role in politics, peace negotiations and peace-keeping on the African continent. Africa, Mbeki clearly recognises, has failed miserably, for whatever reason, in achieving the stability, development and democracy which was the promise of the independence struggles of the late 1950s and 1960s. Mbeki appears desperate to want to play a role in reversing this perception of African poverty and chaos. So whereas Mandela's presidency was characterised by his international role and standing, it may well be that Mbeki takes a less high profile international role, but a more focused African profile.

One exception to this position may well be South Africa's relations with the US, which in terms of the existing binational agreement which Mbeki had so much to do with, and Mbeki's extremely cordial personal relations with vice-president Al Gore (possibly the next US president), may well further blossom out into the kind of 'special relation' status which the US has long had with Israel, and Britain. It would be important to follow Mbeki's stance on foreign policy where these are complicated by human rights considerations, an area in which the Mandela government was severely criticised. With South Africa's contentious two-China policy, now a thing of the past, and with moves towards some form of democracy in countries like Indonesia and Nigeria (in both these cases the

Mandela government seemed prone to one disastrous intervention or policy stance after another), this question may well not tax the foreign policy consistency and logic of Thabo Mbeki's government in the near future.

South Africa's second democratic elections has seen a consolidation of the political centre. The ANC now occupies a centrist position in South African politics. Both ostensibly 'left-wing' parties, mainly black, as well as far-right parties, mainly Afrikaner, suffered humiliating defeats. The success of the DP, and to some extent the IFP, also strengthens the middle ground of South African politics. In the process this 'political centre' is becoming very blurred. Thus on many questions including economic policy, one would have to look hard to spot differences in content. If new, clearer lines of cleavage are to appear in South African politics, they may take the form of some re-shaping and re-ordering of this centre, including possibly, but not probably, a breakaway from the ANC of socialist constituencies within the Tripartite Alliance.

The first five years of democratic South Africa were characterised understandably by a focus on racial reconciliation, and on creating and nurturing a fledgling democracy. So the restructuring of institutions, the development of new institutions (including the Truth and Reconciliation Commission), and the (racial) transformation of institutional structures (army, police, courts, the Reserve Bank, etc) occupied centre stage. The policy of racial reconciliation appears to have had some success, as exemplified by the ANC's much improved performance in areas such as the Western Cape and Northern Cape with relatively large coloured majorities.

Thabo Mbeki has repeatedly emphasised that the second five years will have to be about the speedier delivery of development to the poor, the disadvantaged, the 'ordinary people' whose 'firm hands' have carried the ANC into power, again. If Mbeki achieves this goal without seriously undermining other important national goals such as the consolidation of democracy, the promotion of a truly non-racial society, and within the framework of an essentially neo-liberal economic orthodoxy, he will have confounded his critics and detractors, yet again.

Ladies and Gentlemen,

At the outset may I request you to observe silence for a minute as a mark of respect to our valiant soldiers who have made the supreme sacrifice to defend our country in the Kargil operations

I have great pleasure in welcoming you all to the Forty-sixth Annual General Meeting of your company. The Directors' Report and the Audited Accounts for the Year ended 31st March 1999, have been with you for sometime and, with your permission, I shall take them as read

ECONOMIC SCENARIO

For the Indian economy 1998-99 turned out to be a difficult year, marked by recessionary demand conditions in most industrial sectors. This was despite a good monsoon and record foodgrain harvests. Exports were hampered by the lingering after-effects of the East Asian crisis, resulting in a significant current account deficit, notwithstanding depressed international crude oil prices. Rising fiscal deficits at both the Centre and the States and the lack of progress in spending in key infrastructure areas, added to the woes of industry. Inflation remained high (over 8%) until the third quarter, driven mainly by the spurt in prices of primary agricultural products.

However, certain developments in the economy during the last quarter, have given room for optimism. The Government resumed its reforms agenda with purpose and vigour. Aided by the bountiful foodgrain harvests, inflationary trends moderated and the wholesale price index dipped below 5% by March 1999. The growth oriented budget presented by the Finance Minister, with its thrust on housing, infrastructure and the revival of capital markets had a salutary effect in improving sentiment. The RBI's Monetary and Credit Policy added to the positive sentiment, focussing on structural issues and facilitating the flow of credit to productive sectors of the economy. The emphasis was on continued low interest rates, recognising the need to provide impetus to industrial growth and investment. This was coupled with further progress on financial sector reforms in the areas of capital adequacy, prudential norms and disclosure requirements. The year thus ended on an optimistic note, with hope for revival of demand in the coming months, but with a recognition that substantial further progress was needed in the areas of financial sector reforms and other structural reforms.

WORKING RESULTS

The continued economic downturn in 1998-99, affected the performance of several key sectors including the medium and heavy commercial vehicle segment, the industry posted a negative growth of 16% in production and 12% in sales. Your company's performance needs to be viewed against this backdrop. During the year, the total disbursements of your company in hire purchase and leasing amounted to Rs 817 cr as compared to Rs 956 cr in the previous year, a drop of 14.54%. However, it is gratifying to note that the company improved its market share in almost all the segments of its operations while achieving further improvement in the quality of new assets added. The cumulative receivables under hire purchase and leasing stood at Rs 1957 cr as against Rs 2102 cr in the previous year. The profit before depreciation and tax was Rs 177.72 cr as against Rs 177.52 cr. Profit after tax decreased to Rs 63.31 cr from Rs 76.59 cr for the previous year, mainly on account of provisions for write offs and tax outgo.

Your company mobilised fresh deposits to the tune of

Rs 148 cr and renewed deposits aggregating to Rs 267 cr posting a gross mobilisation of Rs 415 cr. Total public deposits outstanding as of March 1999 amounted to the same level as in the previous year at Rs 775 cr. Considering lower outflow of credit, your company suspended the acceptance of fresh deposits with effect from 1st January 1999. Your company's deposit programme continues to enjoy the highest credit rating of AAA by CRISIL and MAAA from ICRA. I wish to express my grateful thanks to the depositors for the faith and confidence reposed in your company and to reassure them of our resolve to maintain the highest standards of safety, liquidity and service in handling their funds.

Your directors recommend a higher tax free dividend of 5% as against 55% last year, on the paid-up capital of Rs 24 cr. The quantum of distribution including tax on dividend amounts to Rs 17.24 cr. Your company's earnings per share, price-earnings and price to book value ratios continues to be the highest amongst Equipment Leasing and Hire Purchase Companies (EL/HPs).

The capital adequacy ratio as on 31.03.99 was at a comfortable level of 20.74%, well above the stipulated minimum of 12%. Standard assets, according to RBI's classification, stood at 94.50% of the total business assets. After provisioning, the net non-performing assets stood at 3.76% of the total business assets.

YEAR 2000 READINESS

In June 1998, your Company initiated steps to achieve Y2K readiness. Through detailed planning and a dedicated team of software professionals, all business applications covering hire purchase, leasing, deposits and financial accounting have been made Y2K ready before April 1999. Other smaller and non-critical applications have been made Y2K compliant this month. The servers, networking products and

Sundaram Finance Limited

Regd & Head Office: 21, Patullos Road, Chennai 600 002. Phone: 8521181

Speech delivered by
Shri T. S. SANTHANAM, Chairman
at the Forty-sixth Annual General Meeting
of Sundaram Finance Limited held on
28th July, 1999 at Chennai

operating systems located at Head office, Regional Offices and branches have been certified by the vendors as Y2K ready. All business applications and database servers have also been tested by independent Systems Auditors and certified as Y2K compliant.

ROAD TRANSPORT INDUSTRY

For many years now, I have been dwelling upon the neglect of the road network and road transport sector by the policy makers. Road transport continues to account for 80% of the passenger and 60% of the goods transport in our country. Freight and passenger traffic is expected to increase to

800 Billion Ton Km and 3000 Billion-Passenger Km respectively by the year 2001. While road traffic has been growing at a rapid pace, matching investment in the road sector has not been forthcoming, presumably due to the competing demands from other sectors. This has led to a large number of deficiencies in the network, and the resulting inadequacies and imbalances threaten to constrain economic growth and the quality of life in both urban and rural India. The Indian automobile industry is among the most highly taxed in the country. While the industry and the consumers paid Rs.31,714 cr by way of revenues to the exchequer, the Government expenditure on roads was only Rs 6,740 cr. The Government should allocate the entire revenues contributed by the transport sector for the development and maintenance of roads.

Our country has a road network of over 2.9 million Kms of which the primary road system covering National Highways, constituting less than 2% of the total network, carries nearly 40% of the total road traffic. Only 46% of the roads are paved and only 20% of the paved roads are estimated to be in good condition. Maintenance of roads should be given overriding priority with increased emphasis on higher maintenance standards.

The Government of India constituted a Task Force on

Infrastructure to formulate an Integrated Transport Policy. A massive programme of upgradation of the High Density Corridors in the highways involving about 12,000 kms. has already been announced. Within this programme, the development of the major corridors of the golden quadrilaterals linking the four metro cities is given the highest priority. I welcome these measures and urge that steps be taken for their speedy implementation.

I repeat my call for more roads, better roads and better surfacing of roads consistent with the industrial development and growth in vehicle population.

NON-BANKING FINANCIAL COMPANIES (NBFCs) REGULATIONS

The Reserve Bank of India, on 18.12.1998 announced changes in the regulatory framework for Non-banking Finance Companies based on the recommendations of the Task Force appointed by the Central Government. The focus of regulatory attention is on NBFCs accepting public deposits. I am happy to inform you that many of the suggestions made by me in this forum last year were accepted by the Reserve Bank of India.

I welcome these measures which are aimed at the development and consolidation of registered NBFCs on sound and healthy lines and for protection of depositors' interests. By these processes, registered NBFCs have become an integral part of the financial sector. I now make a fervent plea to the Central Government and other authorities that whenever any development and regulatory measures are announced in respect of Banks and Development Financial Institutions, the same shall automatically be extended to registered NBFCs also without any loss of time. The following anomalies, *inter alia*, require urgent correction.

Banks and Development Financial Institutions enjoy

tax deductibility both on provisioning and income deferrals. Additionally, amounts transferred to Special Reserve by Banks and Development Financial Institutions also qualify for tax deductibility. EL/HP Companies, while being subject to all the rigours of regulation, are denied the matching benefits. This situation should be rectified immediately by suitable amendments to the Income-tax Act, 1961.

The existing Civil Court procedures are cumbersome and do nothing to deter wilful defaults. The Board of Industrial Finance and Reconstruction has been very ineffective in reviving sick industries. On the other hand, this forum is being increasingly used by defaulters to thwart the legitimate recovery efforts of the lenders.

An exclusive and effective judicial mechanism needs to be urgently put in place for ensuring recovery of the dues of EL/HP companies, to begin with, on similar lines as Debt Recovery Tribunals. This measure is a *sine qua non* to enable regulated EL/HP companies to play their pivotal role in the financial services sector and to ensure the protection of investors.

PROSPECTS

India continued to feel the effects of the severe East Asian crisis as also the turbulent and unfavourable economic environment in the world economy. In addition to this, our country was also confronted with economic sanctions in the wake of the Pokhran Nuclear test. As a consequence, industrial growth remained sluggish for the second year in succession. Key sectors such as steel and textile continued to perform badly. There are now, however, some early signs of recovery in certain sectors like Cement, Steel, Construction, Commercial Vehicles and Passenger cars which may signal a reversal of the recessionary trends experienced over the last two years. With another normal monsoon being forecast, we can expect an up-turn in demand from the second half of the current financial year.

The overall compounded growth rate of heavy commercial vehicles and passenger cars is forecast to approximate 11% till 2001-2002. With the various

changes that have happened in the market place over the past two years, the number of finance companies active in this market segment has come down. Competition in the commercial vehicle segment will be confined to manufacturer owned finance companies, multi-national finance companies, select Banks and EL/HP companies. Similarly, in car financing, foreign banks and multi-national finance companies are the main competitors.

Given the changing face of competition margins are likely to come under greater pressure. Your company, with the distinct advantages of customer knowledge, speed of response, a wide network and highly skilled and dedicated manpower, is in a position to meet the competition by adopting appropriate strategies and achieve growth in disbursements.

MERGERS

The Hon'ble Madras High Court by an Order dated 18th June 1999 has directed your company to hold a meeting of members today to consider the Scheme of Amalgamation of India Equipment Leasing Limited and Aparajita Group of Companies with your Company.

DIVERSIFICATION

Your Company formed a Joint Venture Company with Fidis, S.p.A., Italy – a financing arm of FIAT in the name of Fiat Sundaram Auto Finance Limited for financing FIAT products. The initial paid-up capital of the company will be Rs. 23 crore. Your company had subscribed 49% of its paid-up capital at par while the remaining 51% was contributed by Fiat Finance, Netherlands, a subsidiary of Fidis, S.p.A. at an aggregate premium of Rs. 42 crore to be completed in two tranches. The new company obtained permission from the Reserve Bank of India and commenced its operations from the current financial year.

Pursuant to the decision to enter housing finance 'Sundaram Home Finance Limited' was incorporated on 2nd July 1999. Necessary steps for establishing the new company are being taken and it is likely to commence its operations before the end of this year.

It may be recalled that your company had signed a Letter of Intent with Winterthur Swiss Insurance in October 1996 to enter General Insurance. However, in January 1998, Winterthur Swiss Insurance was merged with Credit Suisse as a result of which their business focus has undergone a complete reassessment. Consequently they have informed us of their desire to call off the arrangement.

Taking into consideration the above fact and looking to the proposed entry norms and regulatory framework prescribed for new insurance companies, your company has decided not to go ahead with the proposed diversification into general insurance business, as it would not be in the best interests of your company.

ACKNOWLEDGEMENT

On behalf of the Board and on my own behalf, I take this opportunity to thank our depositors, customers, vehicle manufacturers and dealers, bankers, financial institutions and all the shareholders for the co-operation and assistance extended to your company and look forward to their continued support. I also place on record my appreciation of the good work done by all the employees of your company.

ENDURING VALUES. NEW AGE THINKING.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting of the Company.

Indian Democracy: Exclusion and Communication

Dipankar Sinha

The politics of identity, a dominant feature of post-colonial India, is an outcome of a process which reveals both commonality and continuity between two contending and antagonistic entities – the state and the market. The state and the market in the mainstream development mode, which characterises this process, interact almost exclusively with the upper, visible and dominant segments of the society, subjecting vast number of people lower down the hierarchy to silence. The politics of identity manifests itself either as a protest or as a protective response to these exclusionary parties of both the state and the market.

A pochoard and porcupine, defying the grammarians,
Combined to form a porcochard, unmindful of their variance

– Sukumar Ray, 'Hotch Potch'
(tr S Chaudhuri)

THE nineties produces a globally-mobile 'new reality' characterised by a relatively steady retreat of the state and the simultaneous ascendance of the market. A significant feature of such reality is the co-existence of forces of homogenisation and fragmentation, which through an interesting dialectics poses serious challenge to the Indian democracy by threatening many set perceptions and 'reliable' predictions. The gravest challenge in this regard comes in the form of growing assertion of identity, based on categories¹ like region, religion, caste, language, ethnicity and so on. Such assertions have long been officially regarded as 'fundamental obstacles' to the growth and sustenance of democratic spirit, and also, as the 'vanishing traits' of the soon-to-be-integrated Indian society. The challenge emerging from the *politics of identity* is all the more significant because the state, the sole custodian of post-colonial India's development path for almost five decades, tended to treat such eruptions as inimical to the 'nation's progress'. With the state giving more and more space to the market, the politics of identity which continues to intensify, raises new questions.

The thrust of the argument in this paper is that the politics of identity, as noted, is an outcome of a process which reveals both commonality and continuity between two 'contending and antagonistic' entities – the state and the market. The process

manifests itself in the 'communicative dynamics' of the mainstream development mode in which both the state and the market fail to establish a communication network wide enough to take into account and to involve people from all segments of the society. The process relates to a specific type of communicative reason in which interactions are made almost exclusively with the upper, visible and dominant segments of the society. On the other hand, it subjects vast number of people, belonging to the lower, invisible segments to silence (which is communicative) or at best, to superordinate, unilateral 'communication'.²

I

The democratic process in India, as it is formally initiated in legal-institutional terms since the independence, is quite impressive. The introduction of the Constitution of India, the establishment of the republic (in which the people become the ultimate repository of power), the right to equality, the abolition of untouchability, the introduction of universal adult franchise, the centrality of parliament as a debating arena of representatives of the people – all show how people, irrespective of their ascriptive identities, are given an array of rights and freedoms. The democratic roots are further strengthened by having an efficient army which shows little inclination to replace the civilian rule even in times of worst crises. On the economic front, the main plank of the five-year plans, at least theoretically, was redistributive justice which despite its controversial relations with democracy, remains an essential condition for

establishing a democratic ambience in the third world states. The idea of the 'mixed economy', characterised by the public sector "as a national project",³ was a realistic strategy to initiate eradication of economic inequality among the citizens⁴ of a newly independent country, based, as it was, on attempt to utilise the potential of both the state and the market.

Well-being, however, does not necessarily lead to well-being. Having such enumerated rights and privileges is impressive only in an apparent sense unless it is supplemented by their equitable exercise in reality. The gulf between the process of enumeration and that of implementation widens to a dangerous level if the state, amidst ritualistic tributes to democracy, effectively caters to the interests of the few at the cost of many. Taking cue from the point, one can note that even in adopting various policies in the 'interests of the common people', the state does so unilaterally without paying much heed to the felt needs of those for whom they are meant. Being armed with the legitimating rationale of 'nation-building', described by a veteran commentator as "a polite term for cultural and ideological homogenisation",⁵ the state (more specifically, those who wield its power) feels little need to reach out to the people 'down below' by way of a valid and extensive process of communication which would induce involvement of people and develop their empathy for the activities of the state. Though the common people remain at the centre of the statist discourse of governance, they are largely treated in terms of amorphous macro-collectivity. The state's communicative dynamics – constitutive of its voice, and feedback in the form of the voice of the people – remain half-formed, with the majority of people remaining silent and inactive in the business of governance. This blocks consolidation of democracy and prevents its organic integration with society.

The evidences of people, interestingly dubbed as the 'silent majority', being silenced through a range of exclusionary communication, are many. Let us confine ourselves to some significant instances.

One of the earliest instances of the pathetic deficiency of the state to establish communication with the ordinary citizens concerns the failure of the Community Development Programme which was initiated with much publicity, under the auspices of the then prime minister Nehru, with active assistance from Chester

Bowels, the scholar-cum-diplomat on October 2, 1952. The purpose of the programme could not be better: to enlist active co-operation and participation of the people at community level in development programmes and projects. However, the policy-makers ignored the obvious point that such effort, required to address the notion of 'community'. In conceiving the 'community' as a monolith which having existed from 'time immemorial' is regarded as self-defining. This resulted in misconstruction, by the policy-planners, of a concept that defies simplistic interpretations. Such conceptualisation was combined with a communication network that either remained too detached from the people, or in cases where it was not so, it overwhelmed them by sheer one-way diffusion. In such a paternalistic mode, people were treated as 'passive clientele', which destroyed the spirit of the programme. Such paternalism 'overpowered' individuals like S K Dey who were definitely aware of the need to impart a people-centric base to the programme. Ironically, the programme which was introduced on the birthday of Gandhi, lacked what was Gandhi's main strength – the power to communicate with common people.

The paternalistic mode combined with exclusionary communication yet again to make land reforms a stunted venture. The reforms which began at the right moment with the proclaimed objective of restructuring the political and economic equations in rural India, were opposed by the state and local level leaders of the Congress. A distinguished scholar confirms⁶ the point by noting that by the Third Plan it was quite clear that the central authorities had failed to convince the local leaders (including the Congress chief ministers) – who either opposed agricultural reorganisation openly or adopted the course of cautious resistance – that the reforms should be seen as a positive step. As a consequence, the power-base in rural India could only shift from the hands of the zamindars to the rich, and in some cases middle peasantry. Here again, it became quite evident that the policy-makers undermined the importance of a communication network which could make themselves familiar with the 'reality' at the grass roots level.

The imagined placidity of rural India in particular could have been disturbed, to a great extent, by the effective functioning of the panchayati raj institutions in India. With the Balwantrai Mehta Committee Report,⁷ which studies the failure of the community level projects, giving a strong verdict in favour of democratic

decentralisation with special reference to "public participation in community works", a step towards a more communicative state could be achieved. The publication of the report was followed by that of the Asoka Mehta Committee Report⁸ which visualised, along the Gandhian idea of gram swaraj, reorganisation of the panchayats as a major means of linking the state and the society organically, a process which had to have its base in rural India. However, the recommendations of the two committees contained little references to the possible ways of creating an effective communication network between the rulers and the ruled. The point is of significance because the functioning of the panchayats in the states like West Bengal, Kerala and Karnataka shows that despite various possibilities of co-optation the 'voice of the voiceless' could be heard, in some cases loud and clear. The author's ongoing field study,⁹ conducted in some remote areas of West Bengal (the Sundarbans of south Bengal and Naxalbari in north Bengal) reveals that assertion, or even aggressive stance, by the 'habitually passive' local people of very low social and economic status is not a rare phenomenon. One major reason for such change has been the demystification of bureaucracy as a result of the increasing role of the local representatives of the local people. Again, while such change has its limitations, especially when it occurs within a political establishment steeped in electoral politics, it shows that the panchayats, even as the 'satellites' of the state, can create ripples throughout the country in terms of creating channels of communication for citizens who were hitherto regarded as 'dumb'.¹⁰

A very significant instance of unilateral, top-down diffusion of data, information and images, mixed with liberal doses of censoring, concerned of green revolution. After years of misdirected attempt at industrialisation not suitably premised on generation of agricultural surplus, the state-sourced publicity blitz came up with the promise of 'revolutionary' restructuring of the agricultural sector in the quickest possible manner with the help of the state-of-the-art technology. The barrage of information on the 'incredible benefits' from the revolution, found its place in the official pronouncements. Such communication managerialism, quite deftly carried out by the state, did not inform people of the disastrous effects of the revolution on fertility of land, environment and agricultural self-sufficiency, or of the 'politics of dependency' that it seeks to enforce. However, the counterpoint to the state's

tactics could be found in the 'dissident'¹¹ literature in which it was argued that the differentiating logic inherent in the 'technological wonder' would not only accentuate but also widen the disparities among the people, and in a more specific vein, would lead to the dispossession of the small farmers who would not be able to 'afford' to reap its benefits. A more recent attack on the 'violence' of the green revolution came from Vandana Shiva who pointed out¹² that the mantra of the 'revolution' – monocultures (which have biological, economic, political and cultural varieties) – tend to reduce alternatives and options by enforcing a "limiting and limited framework of homogenisation".

The superordinate communication took an interesting turn when it constructed and disseminated the *garibi hatao* (banish poverty) slogan. A populist slogan par excellence, it was directed towards the excluded and the marginal segments of the population. It at the same time both mythified and mystified poverty by bringing it to the centre stage of the state-sponsored discourse of development, but at the same time, kept the related articulations very general and abstract. This was done by providing the thrust on the 'immediate need' for solving the crisis that was part of the everyday life of the people, but at the same time, avoiding any specific references to the means of solution. In functional terms, the coinage of the slogan, incorporated in the Fifth Plan, had much to do with the ensuing parliamentary election.¹³ On a different plane, it was a 'classic instance of 'interpellation'¹⁴ which, having evolved in a 'specific ideological domain', facilitates, through absorption and neutralisation of resistance, the hegemony of the dominant segments of the society. The 'garibi hatao' slogan which is a 'brainchild' of the state, and not of the poor people themselves, gave rise to abstract populism; it also neutralised potential antagonism by transforming poverty into a simple issue that was to be done away with.

Without an effective communication network which is a part of the broader ambience of democratic communication (which shall be discussed in Section II), people remain less aware of their rights and freedoms so extensively crafted in the Constitution. Lack of awareness of one's existing rights and freedoms obviously leads to lack of assertion of the same by the people. On the other hand, it gives rise to a situation in which rights and freedoms are violated by the state, in the form of 'custody deaths' and 'encounters' in the name of maintenance of law and order. In

a number of cases, the 'maintenance of national security' results in sheer state terrorism. On an extensive scale, citizens' fundamental rights are violated by the 'developmental zeal' of the state, which causes displacement of a vast number of 'oustees' who are uprooted from their social, cultural and economic roots, that too without any effective rehabilitation policy.¹⁵ In this case, the communication that reaches the 'oustees' is based on an exaggerated and perverted notion of 'national progress'. The increasingly vigorous call for greater transparency regarding displacement and resettlement through public debate is in a way a direct call for greater communication in this respect.¹⁶

On the cultural front, in which communication has particular significance, the 'omnipotent' state seeks not only to construct but also to disseminate 'national culture' which has an invincible statist core, even if its form may be contingent upon the character of the regime which happens to possess state power. The state's control over 'culture' was evident, though in a subtle form, in the then newly independent India, with the establishment of academies for various cultural activities, by distribution of rewards, and in later years, by arranging cultural festivals. As part of its intervention, rather initiative, in determining the broad contours of 'culture',¹⁷ a notoriously ill-defined idea/way of life, the statist discourse periodically mentions the rationale of a 'national cultural policy'. The continuing reluctance of the successive regimes to provide full autonomy to Akashvani and Doordarshan testifies to the fact that irrespective of political affiliations of the rulers, their patronising instincts induce them to retain and manipulate the potential of the state-owned mass media. In 1975, Indira Gandhi, the then prime minister, mentioned in her characteristic aggressive style that "she did not understand what the concept of 'credibility' implied, since there was no doubt that AIR (All India Radio) was a department of (the) government and would remain so".¹⁸ Being obsessed with the possession of such high potential agencies of communication, and at the same time, by refusing to widen the base of its communication network, the state produces an interesting paradox. With Indira Gandhi's 'straightforward' approach being replaced at present with lip-service to the question of autonomy, the situation has changed very little.

With the promulgation of the Emergency (1975-77), the state made an open display of its cruder face. During the period,

the state's commanding tone reached new height. For instance, the widely-disseminated slogan "work more, talk less", which was constructed to discipline loquacious citizens with a view to orient them to work culture (again undefined), was symptomatic of the *dictat* of a coercive state, defiant of norms of democratic governance. This was notwithstanding the argument that the state tended to embark on the path of compromise at a later stage of the Emergency by being relatively lenient.¹⁹ The Emergency at the same time revealed the 'twilight zone' of the 'benign' and the repressive faces of the state in facilitating crass violation of the rights of the citizens in the name of 'social welfare'. In promoting family planning through forced sterilisation the state crushed the resistance of the people who were marked as the 'target'. To achieve the purpose, the state manipulated its resources and organisations (including the media) so that 'random sterilisation' could be the fate of the poor and powerless citizens.²⁰

Obviously, the state during the Emergency was entwined with the personality-promotion of Indira Gandhi. Here lies an interesting paradox. The state, despite being so overbearing during the period, also became a victim of personalisation of power. The familiar slogan of the era, "India is Indira, Indira is India", coined by the then Congress president, D K Barooah, revealed how an elected leader of the people can transcend her party-identity, and can almost become identical with the state. The process was helped to a great extent by Indira Gandhi's successful role in the Bangladesh war which led her to be described as 'Asia's Liberation Sun'. To refer back to the Emergency, even if the apparent reasons cited for its proclamation were 'national interest' (maintenance of unity and integrity of India) and economic/financial (to keep inflation in check), its hidden (or not-so-hidden) agenda was to put a lid on any critical discussions and debates on Indira Gandhi's rule. So it was inevitable, as one commentator explains,²¹ that the era would witness decline in ideology, and devaluation of political speech, leading in turn to the end of its discursive techniques. It was an era when the state went out of its way to monopolise communication.

However, Indira Gandhi's over-dependence on the state-sourced communication led to her downfall. The 'hangers-on' and the 'pet' political analysts who were in charge of information-processing were too eager to please her with all sorts of 'positive' data, which crippled an effective feedback.²² It also made Indira Gandhi

very complacent and prevented her from indulging in populism with greater force. It was for the same reason that Indira Gandhi did not hesitate to set a date for the parliamentary election which led to her defeat by the people of India. Ironically, a more cautious Indira Gandhi at an earlier stage was very successful in outflanking the opposition of both the Right and the Left variety by invoking populism on the basis of a combination of 'patriotism' (Bangladesh war) and 'radicalism' (garibi hatao).²³

Some observations related to the preceding discussion merit consideration at this point of discussion. First, in all cases, be it in an era in which the state was projecting its 'benevolent' face, or when it was unleashing open repression, its communication with the excluded, marginalised segments of the society was stunted in one way or the other. This of course leads to the point, as noted earlier, that the two 'opposing faces' of the state need not necessarily be treated in black and white terms. It may well be the case that a 'benevolent' state has a hidden cruder face which it does not bring out in the open for tactical reasons. Such blurring of distinction becomes evident in cases where the state in effect adversely affects the interests of the people in the name of serving them. The critics of the liberal reforms in India may, for instance, cite it as a typical case where the state adopts the measures in the 'interest of the people' but in the process let the common people suffer because of the withdrawal of subsidy, contraction of social sector and so on. Second, the exclusionary nature of communication is linked to the development mode which, in its churning process, leaves out a very large 'sedimentation' in the form of people who are not expected to be communicative, even if they are systematically deprived of the 'fruits of progress'. Third, with the development mode having a very narrow base and the related process of communication being so restricted, the retention of various forms of identity—both ascriptive and constructed—among the people of the sedimented segments becomes easier, and the people often tend to fall back upon such identity.

We shall mention more about citizens' communication at the grass roots level in the next section. Here, a 'prelude' can be made by stating that the way out of the oppressive hierarchical and inequitable interaction process imposed from the macro-level (state/market) can be explored through dialectic and polycentric micro-level interactions. The initial response to the suggestion of countering the onslaught

of the 'macro' through the might of the 'micro' may instantly generate disbelief and downright pessimism. However, there is no other alternative through which people can find themselves in a situation in which they can express their own opinion – right or wrong, good or bad, practical or impractical – on issues which affect their life. Within such micro-level acts one can look for 'spaces' of sabotage. 'People's power' can spring many surprises, some of great significance, by taking advantage of the segmentations in the macro-level entity and of the general tendency to undermine the synergy of the micro-level assertions. When people give their verdicts against powerful rulers like Indira Gandhi or when a globally popular brand fails to convince the Indian consumers, it only shows that people can communicate, sometimes very decisively.

II

Historically, horizontal communication remains a blindspot in the mainstream development mode. A detailed account of the mode is beyond the purview of this paper. However, it needs to be mentioned that in it development is perceived to be a "linear arrangement"²⁴ by which some countries will make progress before others, and the 'lessons' gained by the advanced countries would be transmitted to their underdeveloped counterparts which would avoid the repetition of the hazards experienced by the former. Such perception of development, in hindsight, seems to be simplistic. It is at the same time extremely 'undemocratic' because it visualises concentration of development 'at the top' from which it is expected to trickle-down to the lower segments, both internally (within the society) and externally (from the advanced to the underdeveloped countries). Such contention makes communication with the lower segments redundant, and even illegitimate. Such perception gains ground because even if the mainstream development mode, propelled by classical industrialism, produced poverty in the western countries, the 'visibility' of such dispossession was very weak. In fact, the 'visibility' increased with the admirable theoretical contribution of the 'Latin American perspective' (Gunder Frank et al) which introduced the 'development of underdevelopment' thesis.

The history so scripted should not, however, lead one to undermine the significance of communication in establishing a dynamic linkage between the state and the people, from which democratic governance gets its food. Such significance is to be attributed to the fact that in matters

of common collective welfare and equitable distribution of social benefits, citizens need to interact among themselves, and with those in power, as free and open 'entity'. Citizens' communication has been described as the 'barometer of democracy'. A communication-friendly state, coupled with communicative citizenry, can develop a sense-making, meaning-generating ambience, a pluralist and sustainable interactive environment. It would let citizens nurture and develop their own opinions, ideas and attitudes, and create avenues for their expression in some way or other. In the process, the 'fibres of civil society' – voluntary associations, clubs, folk media and so on – can play a contributory role. However, at its base such interactive environment is to have spontaneous, even diffused, face-to-face discussions and debates, and even satires and gossips. Elsewhere I have stressed the vital role of face-to-face interactions as a component of informal and random channels of people-centric communication.²⁵ Satires, for instance, in various forms can make people adopt a more 'realistic' attitude by diminishing excessive awe or admiration of public figures. Gossip, on the other hand, is "a means of public transgression whereby the people are kept informed of the private actions of public personages"²⁶ At the same time, it has been pointed out that in the Indian context where the distinction between 'public' and 'private' spheres is comparatively blurred, especially vis-a-vis the west, "news or information often circulates in the form of gossip".²⁷

In the 1960s, in a pioneering study²⁸ of the development-communication interface, Lucien Pye made us aware of the indispensable role of communication which performs an "amplifying function" by transforming the "man-sized acts" to "society-sized acts". In emphasising that a political system must provide people with a sense of identity and of fundamental membership in a larger community, Pye pointed out that a common fund of knowledge and information, directly contingent upon communicative endeavour, can lead to "sensible debates and collective actions" at a level which keeps people from being unduly naive or excessively suspicious about political motives and actions.

Thus, a healthy communication network, born out of the interactive environment described above, can prevent citizens from being, at least unknowingly, acquiescent to manipulative acts. It also, by implication, makes the state aware of the dangers of indulging in assistencialism, which

includes placation and superficial consultation, and domestication, which involves 'informing' and therapeutic acts.²⁹ One needs to be conscious of the possibilities of co-optation and aggression that remain integral part of creation and retention of the interactive environment we are referring to, but the point remains that in its absence, and the consequent absence of articulated, widespread conception of common welfare and social meaning, 'democracy' and 'development' would be branded as discriminatory processes. It is also obvious that the citizens, once they are convinced of their lack of empowerment to effect institutional decision-making, will steadily alienate themselves from the political process by which we measure consent of the governed.

That the communicative reason of the post-colonial state in India would be what it is can be attributed to the overwhelming legacy of the colonial state. The way the latter used to administer the "command of the sovereign", with the larger purpose of maintaining the colonial order (along with the specific purpose of maintaining law and order, and collection of revenues), it was quite natural that a typical one-way, vertical flow of information would be the order of the day. Ironically, the post-colonial state continued to perpetuate the 'tradition' of the colonial era. This is despite the fact that its emergence was directly linked to a freedom movement which had a fairly wide communication base.³⁰ One interesting manifestation of the post-colonial state carrying on the legacy of the colonial state can be found in some key areas of public administration, such as, the postal and telecommunication services, the railways and the police. In these services there are a number of rules and laws which, despite being enacted in the colonial era, are still in existence.³¹ The point is all the more interesting because the Indian state, having emerged in response to an anti-colonial movement, has a strong streak of national identity attached to it. However, the shadow of the colonial state could loom large over the post colonial state because, as a noted scholar suggests,³² "it was not subject to democratic pressures". Was it at the same time a question of (non)communication? Significantly enough, the same scholar mentions³³ the "problem of intelligibility of the political institutions of the (S)tate" that remains "at the heart of the Indian democratic system". Even such tacit and indirect acknowledgment of the vital role of communication is important considering the fact that the mainstream analyses of Indian state steer clear of the communicational dimensions

and stress overwhelmingly on institutional mechanics,³⁴ as if the two are separable.

III

In the 1990s the Indian democracy finds itself in a sensitive and somewhat uncertain position with the gradual ascendance of the market to a position which was previously held by the state. The Indian state, like many of its counterparts in the world, is going through a 'slimming session', true to the neo-liberal dictum "slim state is a better state". In this era, when democracy is being made synonymous with liberalisation, privatisation and deregulation, for the sedimented segments of the society, which have been victims of exclusionary communication of the state till the other day, the chances of being 'uplifted' through market-induced churning process is rather remote.

The 'transactional' relations promoted by the market turn citizens into consumers who are subject to a wider and more efficient communication network. Such network, however, is constructed and administered by the consideration of maximisation of profit.³⁵ When the market enthusiasts visualise³⁶ what is known as the '20:80 society' – where the top 20 per cent of the population will be showered with wealth and power in return for their role in running the world economy, and the bottom 80 per cent will be kept in check by doses of "tittytainment", composed of food and entertainment – it becomes evident that the market, with its professed thesis of limited liability, would ensure the survival of the fittest without explaining the process by which some acquire 'fitness' and others are destined to remain 'unfit'. If that is not enough, the market-sourced development path seeks to put an end to politics by putting subtle but severe restrictions on critical debates and discussions which can question the discriminatory and inequitable nature of such course of action.

How does one relate the market-sourced communication process to the politics of depoliticisation? Before we explain in the process, it should be mentioned that the steady rise of the market generates mounting optimism among many that, with homogenisation reaching its peak in the 'global village'/'global neighbourhood' which is round the corner, 'tribalism' will soon be a thing of the past. The global spread of the market, coinciding as it does with the spectacular advance of information technology reinforced such high optimism which borders on illusion. But the belief that in the market era, the identity-differentiating factors will be eliminated

is problematic indeed. As the following observation goes:

One of the problems...is of adopting a totalising logic and assume some master process of global integration is under way which is making the world more unified and homogeneous.³⁷

The high tide of optimism about an impending homogenised world ignores the point that the transactional relations treat the issue of 'fragmentation' as of secondary importance as long as it does not come in the way of profitable seduction – luring potential consumers with superabundance of commodity-signs, and with prolific production of commodities with a view to create a consumer culture. The market in this endeavour certainly creates a degree of homogenisation in terms of sets of practices, body of data, information and knowledge, and of course, norms and lifestyles, but it does so at a cultural level which for its operation does not necessarily require elimination of descriptive and constructed identity. In some cases, the market may also go to the extent of taking advantage of such identity to serve its own ends. Thus, for instance, when a multinational soft drink company (which incidentally describes itself as 'multilocal' in advertisements in some western countries) puts its product and Lord Jagannath side by side in a temple-town like Puri, the hoarding itself reflects a subtle attempt to appeal to the religious instincts of the potential consumers in a particular context.

To explain further, until and unless such differentiating identities reach a threshold point, a point beyond which there would be chaos (arising out of civil war, for instance) the market would leave the issues relating to politics of identity to the custody of the state which, under the present circumstances, would be happy to act in the market's favour. It is also a reason why the market-induced communication should be treated with greater caution. The market in many cases subtly communicates through the 'voice of the state', which makes its operation less transparent in a relative sense. The problem becomes all the more serious because in our 'received' knowledge we tend to treat the market and the state in binary opposition, and remain less conscious of the 'new reality' in which the state provides filip to the market.³⁸

To refer back to the politics of depoliticisation which reveals the disastrous impact of the market-sourced communication on the sedimented segments of the society, we should highlight the deft communication managerialism of the market, by which it seeks to attain a 'divine status'. Let us

clarify the point with a couple of instances. After India's initiation to the liberalisation experiment, it has become almost impossible to question the rationale of the process itself. In the official discourse, the "market can do no wrong" idea reinforces itself in such phrases as "the fundamentals remain strong", thereby implying that even the disasters caused by the market are to be attributed to some superficial features of the market operations. A more familiar phrase is "correct value of Rupee" which justifies the successive devaluation of the Indian currency in terms of 'correctness' determined by the market. On a broader scale, the politics of depoliticisation takes firm roots in the 'buhhle of consensus' which keeps debates on market reforms restricted to 'secondary' or 'subsidiary' issues like the degree and terms of withdrawal of subsidy (without raising doubts about the rationale of the withdrawal process itself) or on the number of phases of privatisation of nationalised companies (without raising questions about the rationale of the process of privatisation). In other words, a specific pattern of exclusionary communication is at work to put the liberalisation process beyond the arena of debate, as a result of which it acquires a 'sacrosanct' status. Moreover, in all the cases described above, the distributive irrationalities of the market are relegated to a zone of silence.

The continuity and commonality that mark the state- and the market-sponsored exclusionary communication results in the state losing an opportunity to democratise³⁹ its communication network in the event of the market's inability or unwillingness to do the same. Such opportunity could be availed on one major ground. The state still had the chance to take advantage of its still-large legitimacy in order to initiate a process of self-amendment. It can be argued that even during the Emergency or during demolition of the Babri masjid – the two darkest periods of Indian democracy – the discourse of resistance had not the state but the regimes that made it so repressive and repulsive, under attack. Even in many instances of assertion of identity, the challenge is more directed to the modus operandi of the state, rather than the legitimacy of the state. With certain exceptions, the general tendency of the politics of identity is to demand fair share of resources and opportunities, linked to 'our share' of the state patronage. On the other hand, the state, despite being responsible, in cases like its entente with religious revivalism, for being accommodative toward politics of identity, adopts an apparently embarrassed stance with

regard to eruptions of such politics. In relying on the bogey of 'national integration', that finds expressions in slogans like "One Nation, One Life, Unity", the official discourse, for a long time, presents an image of India which is cleansed of such 'negative developments'. In doing so, the Indian state came much closer to the erstwhile Soviet state which used to claim that ethnic, religious and other differences in the former Soviet Union had withered away. Here again, the state fails to take notice of the fact that to many citizens, such constructions in the official discourse make the discourse itself meaningless and absurd.

When the state fails to democratise its communication network, its implications for the politics of identity is all the more dangerous. In case of the failure of the state, those who could not make it in the stiff competition, could at least vent their frustration and anger against the state – the less mysterious, more familiar entity⁴⁰ which is at the same time more transparent than the market. With the state abdicating power in favour of the market, it is time for the 'open competition' thesis to gain ground in reality. In the market era, the life of ordinary people would be more difficult in view of the fact that in view of a new conceptualisation of 'distributive justice', measured in terms of economic efficiency and nothing else, those who fail to make it in the competition would be branded as 'laggards'. The problem for the deprived and the dispossessed will be greater because they will have to struggle against an unfamiliar and elusive market which prefers to govern by remote control.

Being a discussion of an ongoing process – the dialectics of the state and the market vis-a-vis the politics of identity – the paper lacks a conventional conclusion. However, some observations can be made in lieu of it.

First, the time has come for the 'global village' – romantics to realise that the globalisation project itself does not ensure transformation of the world into a homogeneous space in which all differential identities are levelled out. The 'new reality', mentioned at the outset, is making us aware that globalisation is linked to 'local cosmopolitanism' which questions the assumption of totalistic integration, and embodies assertions of diverse local identities. Second, the politics of identity, which in the Indian context is not to be delinked from the politics of nation-building, is to remain a reality, however 'embarrassing' it may be. It is because community mobilisation, based on assertion of constructed and ascriptive identity is

to continue, and even intensify, either as a protest or as a protective response to exclusionary practices of both the state and the market. Lastly, despite the politics of identity having its own limitations which emerge from internal weaknesses and the external forces of appropriation, it is to acquire a 'nuisance value' in the sense of being a warning to those who tend to deny that the pattern of communication has a crucial role in determining where democracy can go or cannot go.

Notes

[This is a revised and expanded version of the paper presented in a seminar, 'Challenges to Indian Democracy in the 1990s: The State, Market and the Politics of Identity' (August 24-25, 1998), organised by the Centre for Political Studies, Jawaharlal Nehru University, New Delhi, in collaboration with Swedish International Development Association (SIDA). The author wishes to thank the organisers of the seminar, especially Aswini K Ray. The author also expresses gratitude to Sourin Bhattacharya and Anjan Ghosh for their comments on the earlier draft of the paper. Opinions of some of the author's students in the Calcutta University have been very helpful. Usual disclaimers apply.]

- 1 Some of the categories (such as, caste and religion) are ascriptive while some (like region and ethnicity) are 'constructions'.
- 2 Here we put *communication* in quotes, keeping in mind the technicality that communication cannot be a one-way affair.
- 3 The idea that underlies it is that the national elite plays a benevolent role in developing the public sector as an integral part of the task of nation-building.
- 4 We use the term 'citizen' in a general sense, not attributing to it any technicality that is associated with it.

Trade, Technology and Industrialisation

A Developing Country Perspective

Nagesh Kumar

Trade and Industrialisation (ed) Deepak Nayyar; Oxford University Press, Delhi, 1997; pp Xv+326, Rs 545.

THERE are two broad alternative strategies of development. One emphasises 'the virtues of openness and markets' as represented by the Washington Consensus. The Washington Consensus is used to cover the structural adjustment and stabilisation programmes administered by the two Washington-based institutions, namely, the World Bank and IMF. The other stresses the importance of protection and government intervention at least selectively in the process of industrialisation of developing countries particularly in early phases of it. Although the weight of opinion has tended to shift gradually in favour of the former, there have been 'voices of dissent'. This book coherently puts together this dissent and questions the conventional wisdom by highlighting the implicit assumptions in economic theory. The book is a collection of six essays written by eminent economists on different aspects of trade and industrialisation in the context of large developing economies like India.

In the first and introductory essay, Deepak Nayyar, the editor of this valuable volume, provides a detailed analysis of the treatment of the interrelationship between openness and industrialisation in the literature and highlights the dissent. In particular, he builds a strong case for questioning the assumptions of the Washington Consensus that emphasises on the role of markets and trade in development and frowns upon governmental intervention. Nayyar argues that the orthodoxy is rooted in micro-theoretic analytical foundations and lacks a macro-perspective. Besides, a number of assumptions are often violated such as market prices failing to reflect social costs and a country's trade being large enough to influence world prices. Role of technological capability in shaping the gains from trade is not recognised by the Washington Consensus. Globalisation has changed the context as new players, namely, large multinational enterprises (MNEs) have come to dominate technology, investment and trade in the world economy. The new

international regime for trade is highly asymmetric and favours the established players. World financial flows are controlled by international banks and financial intermediaries. The Bretton Woods institutions act as watchdogs and protect the interests of moneylenders in the international capital markets. These themes have been further elaborated in the subsequent contributions by Sen, Lall, Chandra, Singh and Chandrasekhar. Below we provide an overview of select major themes addressed by the volume to highlight the main contentions of the book.

TRADE LIBERALISATION AND INDUSTRIALISATION

The case for free trade is not as unequivocal as it is often made out to be and deviations from free trade have indeed been accepted in the literature. For instance, the case for infant industry protection is justified because of market failures. Similarly, strategic trade theories show that in an oligopolistic market, strategic support for domestic firms can raise national welfare at the cost of trade partners. Furthermore, in his contribution Abhijit Sen argues that drawing upon new trade theories and endogenous growth theory one can show that greater integration with the world economy through trade may serve to strengthen existing patterns of technological leadership. Hence, countries with small knowledge bases may attain higher long-run growth by avoiding premature exposure to world competition. Sen also reviews the existing empirical evidence on trade liberalisation and growth. He concludes that "it can indeed be very costly to ignore exports but the literature provides little support to the claim that trade liberalisation improves economic performance". The profession-at-large too has begun to question the conventional wisdom and the evidence offered in support of it. Many of the cross-country studies on the subject have suffered from serious errors of measurement and other methodological problems, as has been shown in a recent paper by Rodrigues and

Rodrik (1999). After examining the four major and influential studies on the subject including Sachs and Warner (1995), Rodrigues and Rodrik find "little evidence that open trade policies – in the sense of lower tariff and non-tariff barriers to trade – are significantly associated with economic growth".

TECHNOLOGICAL AND INDUSTRIAL CAPABILITY AND THE ROLE OF GOVERNMENT

The role of technological capability in shaping a country's growth performance and international competitiveness is recognised in the new growth theories and neo-technology theories respectively. While liberal access to imported technology is important, an industrialising economy must be able to follow these imports by further effort to absorb, adapt, improvise and eventually accumulate ability to innovate, at least in selected sectors. The role of government intervention is emphasised (most forcefully by Nayyar and Lall) in the area of building technological capability because of market failures as private investors are not able to capture all the returns. Market discipline does not restrain firms from repeated imports.

Governments need to play a crucial role not only in planning for technological development across sectors and time but also in the facilitation and promotion of enterprise-level technological effort. But for strategic intervention by their respective governments, the Japanese and Korean successes in automobiles and consumer electronics would not have been possible. The supportive role of the government is thus a necessary condition for the development of technological capability in late-comers to industrialisation.

In this context, one may refer to the trends of governmental intervention in the area of technology in OECD countries. Kumar and Siddharthan [1997: Chapter 2] have summarised evidence on extensive government support to R and D activities in the most advanced countries. For instance, the government accounts for 49 per cent of total R and D expenditure in France, 47 per cent in the US, 37 per cent in Germany and 34 per cent in the UK. Furthermore, governments support in all these countries also takes the form of direct subsidisation of research by business enterprises. In the US, for instance, over 28 per cent of corporate R and D expenditure was directly contributed by

the government (ibid, p 25). Besides national government support, European enterprises receive substantial R and D funding from the European Commission under the Framework Programmes which have been set up to strengthen their competitiveness in high technology industries. Rubeek (1990) has used the term 'technology race' to describe the aggressive manner in which different OECD countries compete among themselves to promote the technological competitiveness of their national enterprises.

Sanjaya Lall provides case studies of east Asian countries, India and Mexico on the patterns of governmental invention for building technological and industrial competence. These countries have followed different paths to build up capability. While in Hong Kong government invention has been of a non-selective and functional type covering provision of education and training, subsidised land, export information, technical services, etc, in Korea, the government has intervened heavily to build capabilities of its enterprises in selected sectors. The Korean government has directed subsidies and other resources to infant industries in selected industries which have received prolonged periods of protection. Besides its own heavy investments in education,

technical training and technological infrastructure, the government has forced enterprises to invest in employee training, technology absorption and R and D. Indigenous enterprises and technological capabilities were protected by restricting FDI inflows. As a result of the sustained strategic intervention by the government, Korea now has a research and manufacturing base that is able to copy, adapt and build upon state-of-the-art industrial technologies. That gives it a "competitive capability that is probably unmatched, especially in advanced manufacturing" (p 66). There is a great deal to learn from the experience of Korea in building technological capability. However, it would be much more difficult to replicate the Korean success story now in an environment of stricter international protection of intellectual property, among other developments. We revert to this later.

Nirmal Chandra also refers to India's ability to build technological capability in sectors such as petrochemicals, fertilisers, industrial machinery, telecom switching, supercomputing, etc, as vouched for by the World Bank teams, under the protected regime. These capabilities, however, have been threatened by the indiscriminate liberalisation and lack of preferential treatment. He argues the case for technological self-reliance in heavy and

technology-intensive capital goods sectors for a large developing country such as India.

Ajit Singh focuses on the role of stock markets in industrial development. He finds no evidence of deregulation of financial markets having a significant effect on the rate of savings or investment or long-term dynamic efficiency. On the other hand, financial deregulation may lead to a number of harmful effects such as speculation and short-termism.

FDI REGIME AND INDUSTRIALISATION

There is optimism in the ability of expanding inflows of FDI facilitated by liberalisation of investment regimes to lead to greater capital accumulation, generation of employment and sustain infrastructure investment. Besides, FDI is expected to help in transfer of technology and facilitate exports. Sen finds that none of these expectations are fulfilled without qualifications. FDI inflows are highly concentrated in a handful of economies with just the top 10 recipients accounting for nearly three-fourths of all FDI inflows received by developing countries. Recent quantitative analysis questions the ability of policy liberalisation in the poorer countries to expand the magnitude of FDI inflows [Kumar 1999 forthcoming]. Sen observes that a substantial proportion of

CHINA AND THE MIDDLE EAST

The Quest for Influence
Edited by P R KUMARASWAMY

China has evolved a complex Middle East policy in recent years which is now an integral part of its great power aspirations. Comprising original contributions from well-known scholars, this absorbing volume examines China's relations with key players in the region as also the impact of its Middle East policy on interactions with the USA and the UN among others.

Providing well-grounded analyses of China's strategic, political and economic stakes in the Middle East, this volume will attract a wide readership. It will be of particular interest to students and scholars of international relations, Middle East and China studies, political science, diplomacy and strategic studies.

FDI inflows, such as those taking place by way of privatisation, does not lead to significant creation of new capacity, technology transfer or export generation. The same applies to acquisition of local enterprises that is fast becoming an important mode of MNE entry in developing countries, including India. Furthermore, the investments that have gone into infrastructure are normally accompanied by sovereign guarantees, that is, the host governments share much of the risk in the projects. Hence, Sen argues that these investments are more akin to foreign borrowings. Finally, technology diffusion or knowledge spillovers from FDI are relatively limited in the cases of indiscriminately liberal regimes such as Hong Kong and Singapore compared to Taiwan and Korea which pursued a more restrictive and selective regime for trade and investments. Sen infers that benefits from FDI like those of trade openness do not seem to be linked strongly to a general liberalisation of trade and investment regimes. The success depends upon the ability of the economy "to generate internal growth impulses to which desirable FDI will respond" and on its ability to assimilate possible spillovers. Interestingly, a recent analysis of trends in FDI outflows in major source countries to examine the prospects for development of relatively poorer countries also reached very similar findings [Kumar et al 1998].

Similar conclusions on the role of FDI in growth are also reached by C P Chandrasekhar. He observes that the recent boom in FDI inflows is accompanied by a qualitative shift in the nature of FDI. This is because the liberal trade regime puts no pressure on MNEs to invest in productive capacity in developing countries unlike in a protected regime. In the current phase, relocation of world-market-oriented production to the most appropriate sites seems to be one of the motives for FDI. The relocated production, however, is of a footloose type and moves to other sites when the competitiveness of the existing one is eroded. Chandrasekhar reviews the literature and patterns of export-oriented FDI in Asian countries to understand the possible determinants of export-oriented FDI. A recent quantitative attempt made to analyse the determinants of export-oriented FDI by US and Japanese MNEs across a sample of 74 countries in seven branches of manufacturing found home-market-oriented and third-country-oriented export-platform investments to be governed by different factors [Kumar 1998]. This study reported that home-market-bound FDI was favoured by low

cost labour, good infrastructure and trading facilities. Geographical proximity and preferential trade relations with the home country have also helped in attracting home-market-oriented FDI. Third-country-oriented FDI, on the other hand, have been influenced more by strategic and geopolitical factors than factor costs. Countries participating in regional trading blocks have enjoyed a definite edge over others for this type of production. Third-country-oriented investments were more sensitive to openness of trade regime and quality of infrastructure. Interestingly, export obligations imposed by host governments on MNEs at the time of entry prove to be an effective means of pushing MNEs to export more from countries with relatively large domestic markets.

The book also covers FDI in R and D activity. Chandra reviews the recent literature on the globalisation of R and D activity of MNEs and wonders whether the developing world can benefit from a relocation of R and D activities of MNEs. He does not get a clear answer. The prospects for developing countries in the relocation of R and D was subject of a recent study [Kumar 1999] and it may be appropriate to summarise its main findings here. The study found that although increasing over time, R and D is still the least internationalised of MNEs' value-adding activities. The bulk of the R and D activity is still conducted in the home countries and the leading edge research in the core technologies of companies is hardly ever relocated abroad. Overseas R and D is primarily motivated to support foreign production to take advantage of cheaper R and D manpower available abroad and to benefit from competitors' R and D in other countries. The overseas R and D is highly concentrated in the technologically advanced countries and developing countries host a minor part of it. In the leading technologically-industrialised countries, such as the US, R and D expenditure of foreign-owned MNEs generally exceeds what home-based MNEs relocate abroad. Hence, they may be net recipients of the flow of overseas R and D expenditure. A few developing countries that have created considerable national institutional infrastructure for innovative activity and are endowed with cheap R and D manpower, such as India, have also attracted some R and D investments and research contracts from MNEs. But there are very few developing countries with those types of advantages. A quantitative analysis of the factors explaining the locational pattern of overseas R and D by US and Japanese MNEs tended to

corroborate the contention that only countries that are characterised by a large-scale of technological activity and abundant cheap but qualified R and D manpower are likely to play host to MNEs' overseas R and D activity. The size of the domestic market also helps in attracting R and D activity because of economies of scale involved. Policy factors, such as the strength of patent protection offered or the relative openness of the economy, are of peripheral importance, if at all. In the light of these findings the study concluded that the trend of internationalisation of R and D hardly appears to be contributing to a more even distribution of innovative activity in the world.

GLOBALISATION AND EMERGING ASYMMETRIES

With the liberalisation of trade and investment regimes and the opening up of capital, financial and foreign exchange markets across the world, the context for conducting economic activity has changed considerably. In this globalised world economy, Nayyar highlights in his opening chapter, large MNEs, international banks and other financial intermediaries have emerged as powerful players. Since most of these corporations originate in the industrialised countries, their governments see the convergence of their interests with those of these corporations. Hence, these governments use their clout in the multilateral institutional framework to protect their interests. This framework comprises of the WTO, World Bank and IMF.

The international trading system that has evolved with the WTO setting the rules of the game is highly asymmetric and perpetuates the interests of the industrialised countries, argues Nayyar. For instance, it seeks access to the markets of developing countries without corresponding access to technology to develop their industries. Similarly, mobility of capital is sought while restricting labour mobility. The World Bank and the IMF defend the interests of international capital by imposing conditionalities on countries seeking their assistance. These conditionalities seek to harmonise policies and institutions across countries that are consistent with globalisation.

The emerging international regime, therefore, restricts the freedom of developing countries to promote their economic interest by policy interventions. It is much more difficult to protect local industry now than earlier. The new intellectual property regime does not allow

reverse engineering and process adaptations that were the sources of much of the technological learning by Korean enterprises. The emerging international regime on investment seeks to take away the freedom of host governments to select and screen FDI proposals. The conditionalities attached to structural adjustment and stabilisation programmes include deregulation and liberalisation. Hence, strategic interventions for fostering industrialisation have become difficult.

Despite these constraints, Nayyar feels that governments still have some margin for manoeuvre. Within these margins, the state should provide conditions for 'industrial capitalism'. It should bargain with large MNEs for bringing their activities in tune with the host country's developmental goals. Finally, the state must participate actively and try to influence the process of international rules-making to make the 'playing field less uneven'.

The book thus covers a large ground. It is also timely. Against the backdrop of the Asian meltdown, questions have been raised on the virtues of economic liberalism. This book serves the useful purpose of cautioning against excessive faith in the ability of markets to deliver industrialisation and development. It would prove valuable to students and practitioners of development policy and industrialisation. A few of the essays, however, could have been made crisper for improving readability. One essay, for instance, runs into 80 pages with only five headings breaking the running text. This, however, does not diminish the value of the book and Nayyar deserves all praise for delivering it.

Girl Child in the Family

K A Parvathy

Loved and Unloved by Jasodhara Bagchi, Jaba Guha and Piyali Sengupta, STREE, Calcutta 1997, ppix xii + 212 (Distributed by Bhatkal Books International, Mumbai, Calcutta, Delhi, Pune).

NEGLECT of the girl child in India has continued even after 50 years of independence. The girl child suffers deprivation from 'womb to tomb'. A complex set of socio-economic and cultural factors deprives the girl child of its natural claim to childhood and the love and affection that she is entitled to. She is underfed, undernourished, kept illiterate and hurried with marriage and family life even before she is physically and mentally prepared to undertake such a burden. She is not only subject to neglect in the family but is also discriminated outside. The neglected girl child has been a subject of several seminal works right from the pre-independence days. But the retrogressive forces that operate within a family to perpetuate the neglect and deprivation of the girl child have not been fully explored. The book under review is a good attempt in this direction. The book is the outcome of a survey sponsored by the ministry of human resource development, government of India and carried out for the state of West Bengal by the authors working at the School of Women's Studies of the Jadavpur University. The focus of the study is the girl child in her family environment. The study is based on a primary survey of a cross-section of 600 girl children in the age group of 7-18 years (stated as 6-18 years on page 42). The study is based on the information collected from the girl child, her mother and the household.

Chapter I of the study attempts to place the Bengali girl child in the historical setting. The chapter traces the 'social construction of the girl child' through the process of social change that characterised the colonial period in Bengal. The portrayal of the status of girl child during this period reflects the anxieties of the newly emerging middle class. The status of the girl child "was articulated mostly along the lines of her legal and marital status, negotiating several religious orthodoxies to make room

for a school-going, game playing girl child" (viii). The second chapter reviews briefly the literature on the girl child that appeared after 1974. Most of the studies that appeared after 1974 had a developmental perspective, and therefore, concentrated on the deprivations of the girl child – a girl child drawn not from the dominant middle class but from the poorer deprived sections of society. What is emphasised is the threat that society poses against itself by subjecting the girl child to multiple deprivations in the family. The review points out that the neglect of the girl child could be seen as an important cause for the demographic imbalance as indicated by the secular decline in the sex ratio. The major finding of the study of Amartya Sen and Sunil Sen Gupta that girls are more undernourished if they are fed only within the family highlights the retrogressive forces that work against the girl child in the family. The review of the three representations of the girl child in three different media (cinema – drama – novel) bringing out the multiple facets of the gender-based exploitation practised in the Bengali families is unique. Most of the other studies reviewed in the chapter provide statistical information on the status of the girl children in Bengal and add to our understanding of the impact of family environment on the status of the girl child. This part of the book will be useful as a good source of reference for scholars working in the area of gender studies.

Chapter III describes the sample frame and the methodology of the study. On the basis of a four stage stratified random sampling, the study selected 600 girl child households from four villages and two urban wards in West Bengal. Two villages were selected from the relatively developed Bardhaman district and the other two villages were in underdeveloped 24 parganas. The 1981 female literacy rate was used as the main basis for the identification of the villages. From each

district, a village with a high female literacy and another with a low female literacy rate were selected as were two municipal wards from Jadavpur municipal area, one with a high female literacy rate and the other with a relatively low female literacy rate. From the selected villages and wards, 600 households were identified, using the method of systematic random sampling. From each of the 600 households, one girl child in the age group of 6-18 years was selected at random.

From the sample design, one gets the impression that the study would focus on the status of the girl child in different socio-economic contexts – the rural and the urban areas and the relatively developed and the underdeveloped villages. But the analysis of the data generated from the 600 sample households has been done at the aggregate level blurring the distinction between girl children in different regional development settings. The study does not make any effort to delineate the status of the girl child in the relatively developed districts and the less developed districts. Nor does it bring out the differences in the status of the girl child in the rural and the urban areas. More importantly, the study does not analyse the status of the girl child in different social groups like the scheduled castes, the scheduled tribes and others.

FAMILY ENVIRONMENT

The family environment is a critical determinant of the status of the girl child. The socio-economic status of the family, the attitudes and the aspirations of the parents in general and the mother in particular have an important bearing on the quality of life of the girl child. Chapter IV of the study is designed to assess the impact of the family environment on the girl child. The study examines the family environment of the 600 girl child households with reference to well known parameters such as the major occupation of the households, their asset and income status, housing and other living conditions such as access to drinking water, toilet facilities, electricity and cooking fuel. The nature of the family and the size of the households were also examined as a part of this chapter. The health and the educational status of the mothers, their role in familial decision-making and their attitudes and aspirations also influence the growth of the girl child. These aspects are also analysed briefly in the chapter. The major lacuna of the chapter appears to be its failure to bring out the processes through which the family environment influences the status of the girl child on the basis of

the sample. While the socio-economic characteristics of the households are analysed individually, their cumulative impact on the girl children is not traced. For example, the bulk of the sample households are agricultural/sharecropping/agricultural labour households with low and unstable incomes. The asset base of most of these households is so marginal that nearly 50 per cent of them live in kutcha houses without adequate access to basic amenities such as adequate living space, drinking water, toilet facility and electricity. The low income families cannot afford modern cooking fuels such as gas, kerosene or coal. The larger size of most of the households (76 per cent of families had up to seven members), given the limited incomes and the inadequate housing facilities, resulted in the marginalisation of the girl children. The poor health and educational status of the mother aggravated the misery of the girl children. For example, with nearly 50 per cent of the mothers being illiterate one cannot expect a very high enrolment of girls nor a drastic reduction in the drop-out ratio. Similarly, if 75 per cent of the mothers are housewives dependent on the earnings of the male members, then what kind of an attitude or outlook would they have towards the education and development of the girl children? The low educational status of the mother in turn influences her preference for the number and gender of her children, her attitudes towards the small family norm and her perceptions with regard to the future of her children. Thus, the socio-economic and cultural environment of the family influences the development of the girl child in many ways. The study fails to highlight these processes in an integrated way. On the contrary, the study examines different aspects of the family environment of the sample households in isolation.

The core of the study is presented in Chapter V entitled 'The Girl Child: Some Statistics'. Four important dimensions of the status of the girl child, viz, health, education, work status and socialisation have been analysed on the basis of aggregative sample data. Here again, each aspect is analysed in isolation without examining the impact of the underlying internal family and the external environmental factors on the status of the girl child. Secondly, the interrelationships between different aspects of the girl child are not examined either. But the study brings out certain interesting findings. For example, if the observation that more than 40 per cent of the respondent girl children had not received any kind of immunisation is correct, then it dispels the popular belief

that the left government in West Bengal is better in the delivery of basic health services. Secondly, the observation that the utility of public schools is seriously jeopardised by ineffective teaching, leakages in the supply of educational materials and poor infrastructure is equally distressing.

The other conclusions of the study concur with most of the findings of the earlier studies in this area. For example, the study observed the following with regard to the health aspects of the children: no case of amniocentesis was found in the sample mothers; about 43 per cent of the mothers were not given ATS and 44 per cent did not have any check-up during pregnancy; and inadequate breastfeeding was not a problem, but the nutritional deficiency of lactating mothers is the real problem. In respect of educational status of the girl child too the study has come to important conclusions. The major reasons responsible for non-enrolment of girl children according to the study were: poverty and the need to earn income (33 per cent of the non-enrolled girls), housework and care of siblings (22 per cent of the non-enrolled); traditional girl's role and the consequent lack of interest in the girl's education; and vices of parents. Similar reasons were identified as being responsible for the high drop-out ratio among girl children. These and the other reasons have been identified as the principal causes for the non-enrolment of girls as well as the high drop out ratio among them by several studies. The study would have done well to examine the public policy implications of these conclusions.

The analysis of the perceptions of the girl children is quite interesting. It is heartening to note that most of the girls see education as an effective instrument to come out of the shackles of the socio-economic bondage. What is more striking is that a majority of them see education as a means to personal development, gaining self-confidence, and not merely job opportunities. From the public policy perspective, this observation of the study assumes crucial importance. Greater public involvement in girls' education which could widen their horizon is a policy imperative that flows from the study. Apart from education, audio-visual media can play a significant role in changing the perceptions, the thinking and the personality of the girl child. With appropriate changes in the programme format, electronic media can bring about desired changes in the attitudes and aspirations of the girl children. The skills of the girls and their work pattern suggest that there is a

vast potential that could be exploited productively through appropriate educational interventions. This is reflected in the case studies presented in the study as well.

Chapter VI presenting the profiles of 13 girl children forms the major part of this book making up for one-third of its size. The case studies bring out clearly the different forms of discrimination faced by the girl child within the family and the environment in which she grows. They, however, being descriptive in nature do not provide an in-depth analysis of the situation and its impact. All case studies, however, bring out the established fact of "discrimination of the girl child". The chapter straightaway starts with the profiles not caring to provide an introduction to the purpose and the methodology used in the selection of the case studies. Though in the preface it has been mentioned that the case studies show the extent of influence of the mother's attitudes and status on the personality of the girl, this has not been clearly brought out. Neither does this chapter indicate the attitudinal changes over generations. On the whole, though the chapter sensitises one about the situation/status of the girl child, it does not allow one to draw generalisations.

Chapter VII presents a brief outline of three 'entry point' awareness programmes undertaken by the study team to build up rapport with the village community and to carry conviction with them. The first one was an informal literacy-cum-socialisation programme for the less fortunate boys and girls in kushtia village. The programme was very successful largely because, it was informal, flexible and interactive. The immunisation camp and the karshak sabha arranged at the less developed Phulmalancha village were equally successful because they were demand-driven and participatory in nature. The apparent success of the so-called action programmes emphasises the need for the flexible demand-driven programme which could evoke effective participation of the benefiting community.

The study is not oblivious to its limitations. The last paragraph of the book reproduced here frankly admits most of these limitations

The data collected in our survey have not been adequately utilised as yet. The analysis is fully aggregative. Even variations which may exist between different groups within the sample, such as those based on income, occupation, religion, caste, and so on, have not been worked out. A study of the girl child-to-household link, with a view to identifying the progressive and retrogressive factors that operate on the life of the girl child,

has not been carried out. Many questions remain unaddressed. All these questions cannot be analysed on the basis of present survey, but many can. The data have been collected and provide us with material for future research in relevant areas.

It is precisely these questions that need to be answered to identify the progressive and retrogressive forces that operate on the life of the girl child and to suggest suitable interventional strategies. One would only hope that the authors with the wealth of data at their disposal take up these questions for further study. The study is in fact a trend setter in several ways. It has been undertaken in the true spirit

of women's studies, an eclectic discipline. The three authors belong to three different specialities – English, Economics and Gender Studies. They apparently represent three generations – a retired professor, a professor and a research student. The book is a testimony to the successful collaborative research that transcends traditional disciplines. It has an inter-temporal dimension, too. It traces the status of the Bengali girl child through the colonial and the post-independence period, finally bringing out several existential aspects of the girl child. The book is a significant addition to the literature on women's studies.

Faculty Upgradation Program in Environmental Economics October 11-November 5, 1999

Indira Gandhi Institute of Development Research, Mumbai

Applications are invited from faculty of universities, post-graduate departments and research institutions for a four week advanced teaching program in Environmental Economics between 11th October and 5th November, 1999 at the Indira Gandhi Institute of Development Research. This program is funded by the World Bank, Coordinated by the Madras School of Economics, Chennai, and implemented by the Ministry of Environment and Forests, Govt. of India.

Eligibility:

- i. M.A in Economics (with a minimum of 55% of marks) and/or teachers who are teaching Environmental Economics at Master's level;
- ii. At least 5 years of teaching and research experience and knowledge of quantitative techniques; and
- iii. Upper age limit is preferably 45 years (as on 1st October, 1999).

Cost:

The entire cost of selected candidates will be met by the Institute. This shall include either 1st class or 2nd AC travel by train, or bus fare, boarding and lodging and supply of course material.

Application:

Applications from the prospective participants in the program with a full Curriculum Vitae providing details about educational qualifications, teaching and research experience, institutional/University/College affiliations, etc., should reach before **3rd September, 1999** to:

Dr. B. Sudhakara Reddy
Program Director,
Indira Gandhi Institute of Development Research
Gen. A K Vaidya Marg, Goregaon (East)
Mumbai - 400 065, India.
Ph: 022-840 0919, 20; Fax: 022-840 2752
e-mail: bsreddy@igidr.ac.in

The application must be accompanied by

- (i) statement of 500 words on a topic in Environmental Economics which can be later developed by the candidate as a short discussion paper to be presented in a group discussion during the program; and
- (ii) information about the course(s) taught and important books prescribed and consulted during the last five years.

Dr. B. Sudhakara Reddy and
Dr. Manoj Panda
Program Directors

Indian Macro-Economic Data Base in a Consistency Accounting Framework (1950-51 to 1997-98) – I

Identifying Sectoral and Economywide Budget Constraints

M J Manohar Rao
Archana P Samant
Nina L Asher

This study presents for the first time in the Indian context a consistent set of annual macro-economic data from 1950-51 to 1997-98 by integrating the national accounts statistics of the CSO with the balance of payments and the monetary data of the RBI as well as with the fiscal data of the government of India.

Despite certain minor problems of definitions and measurements left unresolved by this exercise, the resulting integration helped us to detect the structural changes that have occurred in the real and financial sectors of the Indian economy over the entire sample period, in general, and between the pre- and post-liberalisation phases, in particular. In such a context, we have identified many important empirical patterns and regularities, notably the existence of business cycles, the counter-cyclical nature of inflation, the cyclical variations in income distribution, the twin deficits problem, the impact of absorption on reserves, the evolution of the debt-income ratio, the relationship between real interest rates and growth, the sustainability of the fiscal stance, amongst others, which could act as theoretical guideposts for the formulation of issues in the role and conduct of macro-economic stabilisation policy.

In this first part, we use a consistency accounting matrix which specifies the linkages between sources and uses of funds as well as between institutional sector accounts. It is seen that the resulting framework ensures the numerical consistency of data drawn from different sources in such a way that both the sectoral budget constraints as well as the overall economywide budget constraints are simultaneously satisfied.

Is consistency the hobgoblin of little minds?

– Ralph Waldo Emerson

I Introduction

THE consolidated accounts of the nation presented by the Central Statistical Organisation (CSO) in their National Account Statistics (NAS) is a system of statistical statements depicting values of final products originating in different industries and those of income generated and outlays expended in the personal and private and also public sectors, which are consolidated with sources and uses of finance or accumulation accounts and closed with accounts of external transactions. Based upon this CSO data set, the Economic and Political Weekly Research Foundation (EPWRF) has since 1996 brought out annually a comprehensive publication which presents the latest available statistics on the national accounts aggregates. However, their latest study *National Accounts Statistics of India: 1950-51 to 1996-97* [EPWRF 1998] notes (p 6) that, "Incidentally, because of

the independent nature of estimates for different macro-aggregates based on separate methods and separate sources of data, the consolidated accounts of the nation presented in the NAS contain large mismatches, discrepancies or errors and omissions." As it is difficult to pinpoint the specific sources of the discrepancies, no attempt is made, either by the CSO or by the EPWRF to adjust any of the estimates to achieve balance in different accounts; and, consequently, these differences are retained as discrepancies or errors and omissions. Needless to say, these mismatches would be all the more magnified if one attempted to integrate the NAS data with the other three major specialised statistical systems, namely, balance of payments accounts, money and banking data and government finance statistics. Thus, a major, and long pending, need of the hour is to bring about harmonisation of all these four accounts and thereby promote the integration of various economic and related statistics.

In such a context, an attempt is made in this study to present a comprehensive and consistent set of macro-economic data

for the Indian economy integrating the national accounts statistics of the CSO with the balance of payments and monetary data of the Reserve Bank of India (RBI) as well as with the fiscal data pertaining to budget financing operations of the Ministry of Finance (MoF), Government of India, for the 48-year period from 1950-51 to 1997-98 (with efforts being made to preserve continuity in the later estimates in view of the recent base change and methodological revision announced by the CSO). This is done by specifying an alternative system of presenting the data generated in the national and related accounts in the form of a consistency accounting framework which is a flexible way of rearranging the data in a matrix form elaborating the linkages between sources and uses of funds as well as between institutional sector accounts. Such an accounting framework seeks to ensure the numerical consistency of data drawn from different sources in a way that the sectoral budget constraints are simultaneously satisfied for all the participants of the economy implying that the overall economywide budget constraints are also observed.

This study initially discusses the elements of such a consistency accounting macro-economic framework based on five principal accounts, i.e., national accounts, government sector accounts, private sector accounts, external sector accounts and monetary sector accounts, which are then integrated through a matrix of income, expenditure, savings, and asset and liability accumulation. The matrix describes the sources and uses of funds for these five sectors wherein the equality of sources and uses of funds (as distinguished between current and capital accounts) is emphasised. The methodology for estimating the individual elements of such a consistency accounting matrix for the Indian economy is then discussed and a comprehensive and consistent macro-economic database for the years 1950-51 to 1997-98 is provided. In line with the inter-linkages between these four systems, the statistical statements presented in the study cover the following broad six time-series data sets: consolidated accounts of the nation encompassing expenditure on gross domestic product (GDP) – as per the Keynesian macro-economic identities – and the relationship between national income and other key macro-economic aggregates, appropriation of national and private sector disposable income, the capital finance account and the financial sources for gross accumulation, financing of government budgetary operations, consolidated BOP accounts comprising current and capital account transactions, and the balance sheet of the consolidated banking system.

While the integrated system accepts most the official series as given, the use of such a consistency framework implies that the 'Errors and Omissions' – which, as noted earlier, are invariably used in standard practice to balance and reconcile the various macro-economic identities – are precisely apportioned between certain aggregates thereby treating them as residual items. It needs to be noted that the basis of our conceptual framework lies almost squarely within the UN-SNA, i.e., the United Nations System of National Accounts (United Nations 1968), except for certain deviations which are primarily due to marginal methodological differences. Suffice it to say, despite these and certain other minor problems of definitions and measurements left unresolved by this exercise, the success achieved by us, at times with some compromises on the purity of concepts and theories, in integrating the basic time-series on national accounts with related aggregates should help to depict the growth of, both

the real and financial sectors of the Indian economy, as also its structural changes, over the years. In such a context, the identification of certain empirical patterns and (ir)regularities could facilitate translation of certain important theoretical constructs on structural adjustment problems into various policy relevant solutions and interrelationships.

II Need for Consistency

Because consistency is often tedious to enforce, it is important to remember for what purpose it is required in macro-economics. Consistency is simply the requirement that budget constraints be observed for all participants of the economy. Budget constraints appear at the economy-wide level in the form of four familiar macro-economic identities, viz., the national accounts identity, the fiscal identity, the balance of payments identity and the monetary sector identity. A basic consistency framework requires that all these four identities – as well as the private sector budget constraint – be simultaneously satisfied. If one or more of the identities is left out of an economic projection, the implicit values for the components of the missing identity may take unrealistic values. Even if all identities are included, they may be satisfied in an inconsistent way. For example, as is often the case, one estimate of the change in foreign exchange reserves might be used in the balance of payments identity while a completely different one might be used for the monetary sector identity.

Consider the following hypothetical, albeit relevant, example which illustrates the consistency problems that are likely to arise if an integrated framework is not used. Suppose that the Planning Commission envisages an increase in the real growth rate from 5 per cent to 7 per cent over a five-year planning horizon, without any reliance on foreign capital inflows. To support this increase in growth, the investment rate is projected to increase from 25 per cent to 35 per cent of GDP, thereby assuming that the incremental capital output ratio (ICOR) remains unchanged at 5; and in order to preempt crowding out, both public investment and public consumption are expected to stay constant at their existing levels of 10 per cent and 15 per cent of GDP, respectively. At the same time, the Ministry of Finance projects that the fiscal deficit of 6 per cent of GDP is gradually reduced to zero over the plan, financed entirely by taxes; while the CAD is reduced from 2 per cent to

1 per cent of GDP. Finally, in such a context, the RBI intends to hold the annual inflation rate constant at 6 per cent over the plan.

While the above projections are certainly consistent, they are entirely unfeasible because they imply unrealistic private sector behaviour. The private investment rate must increase from 15 per cent to 25 per cent of GDP, since total investment is increasing while public investment is remaining constant. To finance the higher investment with the lower current account deficit, private savings must increase from 19 per cent to 24 per cent of GDP, while public savings must increase from 4 per cent to 10 per cent of GDP. However, as the higher public savings is financed by increasing taxes, this will decrease private disposable income from 81 per cent to 75 per cent of GDP. Thus, private savings as a per cent of private disposable income will have to increase from an average rate of 23.5 per cent to 32 per cent. Given the growth and inflation projections, this would imply a staggering marginal propensity to save of almost 44 per cent over the plan. It is difficult to conceive of any reasonable policy measures that would elicit such a powerful response in private savings.¹

These values of savings and investment also have implausible implications for financial aggregates. Supposing that 60 per cent of private savings goes into financial asset accumulation; and also assuming that the income velocity of money and the interest rate remain constant at their existing levels of 1.5 and 10 per cent, respectively. Then the resulting increase in savings and money growth rates would imply that government borrowings would have to be stepped up from 4 to 5.7 per cent of GDP. The initial ratio of financial assets to GDP which is 100 per cent, being the steady state value consistent with the initial savings and growth rates, would rise to 107 per cent, implying that the debt-GDP ratio would increase from 33 to 40 per cent. This, in conjunction with the given interest rate, would imply that the initial primary deficit of 2.7 per cent of GDP would need to be converted into a primary surplus of 4 per cent. Since the public deficit is being reduced, the implications for credit allocation would be equally strong. Over the plan, the ratio of private sector credit to GDP would more than double from 7.4 to 15.4 per cent of GDP; while that of the public sector would decrease from 2 per cent of GDP to ~5.7 per cent, implying that the latter would end up by being a net creditor to the banking system.²

TABLE I CONSISTENCY ACCOUNTING MATRIX

Sources (Across and Uses (Down))	Current Account of					Capital Account of					Total
	(C1) National Accounts	(C2) Government Sector	(C3) Private Sector	(C4) External Sector	(C5) Monetary Sector	(C6) Government Sector	(C7) Private Sector	(C8) External Sector	(C9) Monetary Sector	(C10) Total Investment

External Sector (R8)				E Savings or CAD of the Domestic Economy					Change in Foreign Exchange Reserves (δR*)		External Savings plus δ Reserves = CAD + δR*
Monetary Sector (R9)						Change in Broad Money plus other liabilities (δM)					δ Domestic Liabilities of the Monetary Sector = δM
Total Savings (Sum of 4 Rows) (R10)		Gross Government Savings (Sg)	Gross Private Savings (Sp)	Current Account Deficit (CAD)							Domestic plus Foreign Savings = Sg + Sp + CAD
Total	GDP at Market Prices + Imports = Ymp + Z = OSg + Dg + (Ti-Sb) + (W + π) + Dp + Z	Total Govt Current Uses = CEXPg + Sg = Cg + NTRep + INTgp + INVge + Sg	Total Pvt Current Uses = CEXPp + Sp = Cp + Td + INVpe + Sp	Total Current Foreign Exg Receipts X + NTRep + NTRep + NTRep + CAD		Government Investment = Ig	δ Assets of Pvt Sector = Ip + δB + δM	δ in Foreign Borrowings = (δF) = (δFg + δFp)	δ Assets of Monetary System = (δDCg + δDCp + δR*)	Total Investment (I) or (δK) = Ig + Ip	

Notes: (1) G, P and E refer to Government Sector, Private Sector and External Sector respectively.
 (2) The 'δ' preceding any variable indicates a one period change in that variable, i.e. δDC = DC - DC(-1)

While such an outcome is not mathematically impossible, it is very unlikely that the set of policy actions, private sector responses and external conditions would all be sufficiently strong to generate these results in any country. What initially seemed like a reasonably feasible projection becomes highly unlikely when it is analysed in a consistency framework. Thus, while a consistency framework is not in itself a model such as could be used to make projections, by providing a generic check on any projection done by an explicit or implicit behavioural model, it can be used as the foundation for the construction of a model.

III Elements of a Consistency Accounting Framework

From the viewpoint of an economy or an economic agent, production, income and expenditure (or savings) are linked together by three basic relationships: between production and income, between income and expenditure, and between savings and asset acquisition. These three notions are linked since budget constraints must be adhered to by all sectors (or agents) in the economy. This implies that for any sector, income from production plus net transfers is equal to the acquisition of physical and financial assets. For the economy as a whole, the value of production must equal the value of income generated. These concepts are briefly explained below.

For any producing unit, the value of production must be equal to the value of income that the unit generates. A similar argument holds for the macro-economy as a whole: the value of domestic production must be equal to the value of income – excluding transfers – that is domestically generated. This income, however, may accrue to either resident economic agents or to foreign residents. Similarly, domestic economic agents may receive factor payments from abroad. Income accruing to nationals or national income therefore equals gross domestic product less factor payments from abroad.

For any economic agent, income earned (regardless of whether the source is domestic or foreign) plus transfers received finance expenditure. Income plus transfers, however, need not be equal to expenditure. Savings, which may be positive or negative is the balancing item. The basic relationship linking income and expenditure is therefore as follows: for any economic agent, income plus transfers must be equal to expenditure plus savings.

TABLE 2: METHODOLOGY FOR ESTIMATING A SET OF CONSISTENT MACRO-ECONOMIC DATA FOR THE INDIAN ECONOMY

Step	Cell	Variable	Components	Source(s)	Comments
1	R2C1	$Y_{mp}_g =$	OS_g $+ D_g$ $+ T_i$ $- S_b$	CSO, EPWRF:24 [Item 2.1] EPWRF:4A [Col 14] EPWRF:2 [Col 9], QE:9 [Item B.10], EPWRF:2 [Col 10], QE:9 [Item A.3]	See Appendix I
2	R2C3	$T_d =$	T_{d_c} $+ T_{d_h}$ $+ MR$	EPWRF:2 [Col 23] EPWRF:2 [Col 25] EPWRF:2 [Col 26], QE:9 [Item B.11]	
3	R2C4	NTR_{cg}		RBI:1 [Item 117(i)], CF:BOP [Item A.11 b(vi)]	
4		$Y_g = Y_{mp}_g + T_d + NTR_{cg}$			Total of Row 2
5	R3C2	$NP_{gp} =$	NTR_{gp} $+ INT_{gp}$	EPWRF:2 [Col 19], QE:9 [Item A.4] EPWRF:2 [Col 17], QE:9 [Item A.2]	
6	R4C2	INV_{gc}		RBI:10 3	See Appendix II
7	R6C2	S_g		EPWRF:4A [Col 13]	
8	R1C2	$C_g =$	$Y_g - NP_{gp} - INV_{gc} - S_g$		Derived residually
9	R3C1	$Yfc_p =$	$(W + \Pi)_{gp}$	$(NYfc - OS_g)$	Derived residually
10	R3C4	$NER_{cp} =$	$+ D_p$ $+ NTR_{cp}$ $+ NFP_{cp}$	EPWRF:4A [Cols. 8 + 11] RBI:1 [Item 7(ii)], CF:BOP [Item A.11 b(vii)] RBI:10 5	See Appendix III
11		$Y_p = Yfc_p + NP_{gp} + NER_{cp}$			Total of Row 3
12	R4C3	INV_{pc}		RBI:10 3	See Appendix I;
13	R7C3	$S_p =$	S_{ph} $+ S_{pc}$	EPWRF:4A [Col 7] EPWRF:4A [Col 10]	
14	R1C3	$C_p =$	$Y_p - T_d - INV_{pc} - S_p$		Derived residually
15	R4C1	$Z_p =$		RBI:1, CF:BOP	See footnote (i)
16		$CEA = Z + INV_{gc} + INV_{pc}$			Total of Row 4
17	R1C4	X		RBI:1 and CF:BOP	See footnote (i)
18	R8C4	$CAD =$	$CEA - X - NTR_{cg}$	$- NER_{cp}$	See footnote (ii)
19	R8C5	$\Delta R^* =$	ΔR $+ (IMF + SDR)$	RBI:1 [Item 11], CF:BOP [Item E(ii)], RBI:18 [Item 9 and 11], CF:BOP [Item E(i)]	
20	R6C8	$\Delta F_g =$		RBI:18 [Item 7], CF:BOP [Item 2 (a)]	
21	R7C8	$\Delta F_p =$	$CAD + \Delta R^* - \Delta F_g$		Derived residually
22	R6C9	ΔDC_g		IEJ, CF:MS	
23	R7C9	ΔDC_p		IEJ, CF:MS	
24	R9C7	$\Delta M =$	$\Delta DC_g + \Delta DC_p + \Delta R^*$		See footnote (iii)
25	R6C7	$\Delta B =$		PG:3 5, CF:Borr	See Appendix IV
26	R1C6	$I_g =$	$S_g + \Delta F_g + \Delta DC_g + \Delta B$		See footnote (iv)
27	R1C7	$I_p =$	$S_p + \Delta F_p + \Delta DC_p - \Delta B - \Delta M$		Derived residually

Notes: (i) Data on imports (exports) of goods and services were computed by adding up debits (credits) on the merchandise and invisibles accounts excluding, in the process, investment income, external transfers and payments (receipts) for professional and technical services (See Appendix III for details on estimation of payments (receipts) for professional and technical services).

(ii) It was seen that the values of CAD thus computed matched exactly with those reported by the RBI.

(iii) It needs to be noted that these estimates of ΔM differ from those reported by the RBI in two very important respects: (a) They absorb changes in total liabilities (i.e. government currency liabilities and net non-monetary liabilities) and therefore indicate the total change in broad money supply inclusive of other liabilities; and (b) They reflect the change in foreign exchange reserves as derived from the BOP constraint, i.e. ΔR^* , and not the change in net foreign exchange assets (NFEA), which also include valuation changes, as is done in the balance sheet of the banking system. These two methodological changes are vital as it is the only way to preserve the link between the external and monetary sectors without which it is not possible to ensure overall macro-economic accounting consistency. However, it is seen that, despite these revisions, there is not much difference between our estimates of ΔM and the corresponding RBI estimates, although they do differ considerably in level terms.

(iv) This method was used to compute I_g only upto 1989-90. The methodology used to compute I_g for the subsequent period has been discussed in Appendix IV.

A third basic relationship links savings and asset acquisition: for any economic agent, savings plus borrowings must equal asset acquisition. These assets may either be physical assets (excluding consumer durables) or financial assets. There is no presumption about savings or borrowings being positive or negative. Specifically, either or both can be negative, and the relationship will still hold.

The ensuing framework is based on five accounts corresponding roughly to the macro-economic identities mentioned above. These five accounts are: (1) national, (2) government sector, (3) non-financial private sector, (4) balance of payments, and (5) monetary system. These would be

the minimum elements of a consistency framework.

The government is defined as the general government, thereby comprising all levels of government (central, state, district and local) as well as public corporations funded through the government budget. The non-government (private) sector includes the household sector as well as the private corporate sector. The monetary system includes, both the central bank and all other scheduled commercial banks, as well as private savings banks and other public savings institutions. The external sector includes all transactions of non-residents with residents and the consolidated accounts of this sector thus become an

abbreviated balance of payments (BOP) account.

Given such a sectoral classification, the accounts can be presented in two ways. One can either present them as individual accounts or integrate them through a matrix of income, expenditure, saving, and asset and liability accumulation. Although the individual accounts give a comprehensive presentation of the flows in a consistent framework, it is helpful to integrate the accounts so that they are mutually consistent. For this, a useful device is a matrix of sources and uses for the four sectors plus the national accounts. The matrix can be seen as a combination of a flow-of-funds (FOF) matrix and a social account-

ing matrix (SAM). The FOF methodology emphasises the equality of sources and uses of funds, distinguished between the current and capital accounts; while the SAM approach presents the standard macro-economic identities (savings-investment and income-expenditure) in a form that shows the participation of each economic sector in the economy. The SAM was traditionally used for analysis of the real economy, as in computable general equilibrium models, and thus covered only real variables. However, it was extended by Easterly (1989) to include real and financial interactions as well.

The consistency matrix has the advantage that it captures the essence of both

the SAM and FOF approaches. The matrix, which is presented in Table 1, has the appealing feature that the row sums must be equal to the sum of the corresponding columns. This allows us to verify that the accounts are consistent. Like the SAM, it also presents the main macro-economic identities in a transparent way. Thus the first row is the conventional GDP identity from the expenditure side, while the first column is the GDP identity from the income side. The 10th row and 10th column provides the savings-investment identity. As in the FOF approach, the matrix stresses the identity of sources and uses, distinguishing between the current and capital accounts.

The upper left-hand 5x5 corner of the matrix presents the current account transactions of each of the five sectors. The remainder of the matrix records the capital account transactions for each sector. The connecting link between the two is the saving of each sector, shown as a 5x5 matrix in the lower left-hand side of the overall matrix. Thus, the first part of the matrix records the identity of current sources and uses, where the latter includes savings. The second part of the matrix, i.e., the lower half and the right half and their intersection, shows the financing identity of each sector, with their borrowing shown across the row and their asset accumulation down the column. This is the identity

(Contd)

of capital sources and uses, with savings again as the balancing item.

Since the row sums must equal column sums in this matrix, this implies that investment plus financial asset accumulation must equal savings plus financial liability accumulation. This is another form of the familiar identity which states that saving minus investment equals net financial asset accumulation for each sector.

CURRENT ACCOUNT TRANSACTIONS

In Table 1, the first row and the first column (the national accounts) depict the production account of the economy. As presented, the national accounts group the

activities of all producing units together. Thus, they include the production of all incorporated enterprises (including financial institutions), unincorporated enterprises, producers of government services, and production by households, regardless of the type of good or service produced. Across row 1, the table describes how goods and services that are produced domestically (Ymp) or imported (Z) in the current production period are disposed of between government consumption (C_g), private consumption (C_p), exports (X), and gross investment of the government and private sectors (I_g and I_p , respectively), the last two representing the acquisition of physical assets as distinct from the

acquisition of financial instruments. Here Ymp represents gross domestic product (GDP) at current market prices. Column 1 breaks down this value of current domestic production at market prices by identifying the types of incomes that are generated through the sale (plus own consumption) of domestic production. These incomes are in the form of the net operating surplus of the public sector (OS_p), depreciation of capital engaged in public sector's production (D_g) and net indirect taxes, i.e., indirect taxes (Ti) less subsidies (Sh) – the sum of the first two items yields Yfc_g , which is the share of the government sector in GDP at factor cost, while the sum of all the three items yields Ymp, which

DOCTORS FOR RURAL HEALTH PROJECT

Are there no doctors in our country willing to accept a challenging, rewarding and meaningful opportunity to create for themselves a lifestyle in a beautiful, rural, Himalayan environment? Is their only attraction the lucre that cities like Delhi have to offer, notwithstanding the often demeaning struggle to survive and rear a family in filthy, congested and polluted surroundings?

Surely, there are some doctors seeking to improve the quality of their life – both professionally and personally. CHIRAG, an NGO working in Nainital District, U.P. would welcome two such doctors. Genuine interest, motivation and commitment to work in a rural area is a must, preferably with a love for the mountains. Ideally, CHIRAG would like a doctor couple – the husband a pediatrician or physician and wife doing O & G.

Currently, CHIRAG's health project covers about 40 villages and focuses on women and children. There is a clinical facility with three beds and several trained nurses, health workers and midwives. Plans are afoot to build a cottage hospital of around ten beds. The doctors will be responsible for planning, building, commissioning and running the hospital as well as the extension activities in the villages.

Write to

Chairman, CHIRAG, Sitla Village, P.O. Mukteshwar - 263138 Nainital District, U.P.

CENTRE FOR EDUCATIONAL STUDIES, INDIAN INSTITUTE OF EDUCATION, 128/2, J.P. Naik Path, Kothrud, PUNE 411 029.

1. Applications are invited along with detailed bio-data, for the posts of Professors, Readers and Lecturers to conduct interdisciplinary M.Phil. and Ph.D. programmes in Education. Persons with suitable qualifications in Educational Sociology, Educational Psychology, Social Psychology, Political Science, Communication and Information Technology, Management/Public Administration or a suitable Science degree may apply. Applications should be addressed to the *In-Charge Director, Centre for Educational Studies*, so as to reach on or before **6th September, 1999**.
2. **No. of Posts:** Professors: 2; Readers: 2; Lecturers: 2.
3. **Qualifications:**
As prescribed by University recognition rules for post-graduate Teachers. **Essential:** Proficiency in conducting and guiding research publications and experience will receive weightage.
4. **Pay Scales:** As per Rules.
5. **Probation Period:** 2 years.
6. a) One post of Reader and one post of Lecturer will be located at the G.D. Parikh Centre, CES, at Vidya Nagari, Kalina, Bombay.
b) Residential accommodation available at Pune campus of CES.

NOTE: (a) The posts may also be filled by deputation.

(b) Applications must be sent through proper channel along with a 'No Objection Certificate' from the employer.

FIGURE 1.1: PUBLIC SECTOR INVESTMENT

FIGURE 1.2: PRIVATE SECTOR INVESTMENT

is the share of the government sector in GDP at market prices – as well as wages, salaries and incomes of the self-employed and own account producers (W), net profits of the private sector (IT) and depreciation of capital engaged in private sector's production (D_p) – the sum of these three items yields Y_{fc_p} which is the share of the private sector in GDP at factor cost.

Row 2 and column 2 of Table 1 depict the current transactions of the government. Across row 2, the sources of government income (Y_g) are identified. These include, as referred to earlier, the share of the government sector in GDP at current market prices, i.e., Y_{mp_g} , besides direct taxes (T_d) – comprising corporate taxes (T_{dc}), direct taxes as paid by households (T_{dh}) and miscellaneous receipts of government administrative departments (MR) – and net official transfers from the external to the government sector (NTR_{eg}). Column 2 details all items of current government expenditures ($CEXP_g$): government consumption of currently produced goods and services (C_g) which is the cost of providing government services, net payments from the government to the private sector (NP_{gp}) which includes net

transfers to domestic households from the government (NTR_{gp}) and interest paid to households on the domestic debt (INT_{gp}), and net investment income accruing to the external sector from the government (INV_{ge}) – of which the interest paid by the government sector on its external debt (INT_{ge}) forms a major component. Government savings (S_g) is thus the difference between government income (Y_g) and expenditure ($CEXP_g$).

Row 3 and column 3 describe the accounts of the non-government (private) sector. Across row 3, the sources of private sector income (Y_p) are identified. They include, as referred to earlier, the share of the private sector in GDP at factor cost, i.e., Y_{fc_p} , besides net payments received by the private sector from the government (NP_{gp}), and net external receipts of the private sector (NER_{ep}) comprising net transfer payments from the external to the private sector (NTR_{ep}) and net factor payments from abroad (NFP_{ep}). Column 3 describes how private sector income is disposed of: private consumption (C_p), payment of direct taxes (T_d), and net investment income accruing to the external sector from the private sector (INV_{pe})

– of which resource transfers (including interest payments) incurred on account of private sector external borrowings/liabilities (INT_{pe}) form a major component. Private savings (S_p) is the balancing item and is the difference between total private sector income (Y_p) and total current expenditures of the private sector ($CEXP_p$).

Row 4 and column 4 depict the current account balance of the BOP. Across row 4 the sources of income accruing to foreign residents are provided. These include net investment incomes accruing to the external sector from the government (INV_{ge}) and the private sector (INV_{pe}) as well as the value of imports of goods and services (Z). Payments of principal on the external debt are recorded in the capital finance accounts, i.e., "below the line" (see rows and columns 6 through 9), and are thus not included in the current account. Column 4 lists the sources of income accruing from foreign residents. These are in the form of exports of goods and services (X), net current (as opposed to capital) transfers to the government sector (NTR_{eg}) and private sector (NTR_{ep}) as well as net factor payments to the private sector (NFP_{ep}). The savings of foreign residents in their dealings with the economy – identical to the current account deficit of the domestic economy (CAD) – is the balancing item between current external receipts and payments.

As a pure intermediary, the monetary system has no independent (own account) current revenues and expenditures. The revenues of financial institutions (service charges, interest on loans, and earnings on investments made with deposits or premiums) less their costs (interest on deposits or claims paid) constitute the value added of these institutions within the monetary system as producing units. As this value added is included in the production account of the domestic economy as income to households or to the government, row 5 and column 5 are therefore empty.

CAPITAL ACCOUNT TRANSACTIONS

While rows and columns 1 through 5 describe the current accounts of the economy, rows and columns 6 through 9 describe the corresponding capital account transactions, i.e., the financing of asset acquisition by the government sector, the private sector and the external sector through the intermediation of the monetary system.

In row 6, gross savings of the government sector (S_g), along with government borrowings from the monetary system (ADC_g), net direct government borrowing

from the private sector (ΔB), and net foreign borrowing by the government (ΔF_g) are used to finance asset accumulation by the government (I_g in column 6). Asset acquisition is usually of three forms: gross fixed investment (including physical assets, inventories and working capital, as well as intangible non-financial assets); financial assets in the form of loans to the private sector; and the acquisition of foreign assets. However, the last two items have been netted out from government borrowings from the private sector and foreign borrowings of the government, respectively, and therefore these items do not appear explicitly as separate entities in the matrix.

Row 7 and column 7 deal with the private sector. In row 7, gross private sector savings (S_p), borrowings by the private sector from the domestic monetary system (ΔDC_p), and net new private sector borrowings from foreign residents (ΔF_p) are used to finance asset acquisition by the private sector. These include the items detailed in column 7 which can be split up into physical asset acquisition, i.e. gross private sector investment (I_p), and financial asset acquisition, i.e. net lending to the government (ΔB) and fresh holdings of new issues of money and near money held by the monetary system (ΔM).

Row 8 and column 8 deal with the external sector. Row 8 implies that the savings

of foreign residents or the current account deficit (CAD) plus the proceeds from the acquisition of international reserves (inclusive of IMF purchases and SDR allocations) by the monetary system (ΔR^*) are used to finance the items listed in column 8: net foreign borrowings of the government (ΔF_g) as well as the private sector (ΔF_p).

Row 9 and column 9 deal with the monetary system. Row 9 indicates that as an intermediary it acquires liabilities principally in the form of new domestic currency issues, demand deposits and time deposits, as well as other liabilities including treasury bills, and so on (ΔM). Column 9 implies that it, in turn, acquires assets in the form of loans to the government and the private sectors (ΔDC_g and ΔDC_p , respectively), as well as net foreign assets or international reserves (ΔR^*).

Finally, row 10 and column 10 deal with the overall savings-investment balance at the macro-economic level. Row 10 shows that total domestic savings, i.e. the sum of government savings (S_g) and private savings (S_p), plus foreign savings, i.e. the current account deficit (CAD), must finance total investment (I in column 10), i.e. the sum of government investment (I_g) and private investment (I_p).

Thus, reading across rows in Table 1 provides the sources of finance for each sector while reading down columns indicates the uses of finance. *Ex post*, each

sector's deficit must be financed and, as such, the sum of the rows is always equal to the sum of the columns. *Ex ante*, these balances become constraints for modelling the sectoral behaviour, be it financial or non-financial, of the government, private, external and monetary sectors. Each of the first three sectors involves income as well as financial transactions, whereas the income transactions of the monetary system are considered to be negligible. An increase in the deficit or a reduction in the non-financial net savings of a sector will result in either an increase in its financial liabilities or a decrease in its holdings of financial assets or both. Furthermore, given its non-financial savings or deficit, a sector can acquire more of one financial asset only at the expense of accumulations to its holdings of one or more alternative financial assets or in exchange for increases in one or more financial liabilities. At the end of each period, usually a year, each sectoral account has to be balanced.

The fundamental difference between the flow-of-funds and the market equilibrium approaches while formulating a model is that sectoral balances are treated as constraints in the former while the latter treats market equilibria as constraints. In the case where market forces and instantaneous adjustments co-exist, these two types of constraints are equivalent since when all sectoral accounts are balanced, all

Note: See Appendix V in the methodology used for estimating some of the components of the above matrix.

markets must be cleared. However, any market imperfections and lag adjustments would create a situation where sectoral balances are not equivalent to market equilibria. For instance, when credit rationing is in force, the money market cannot be in equilibrium by definition. The resulting disequilibria in the money market must co-exist with the disequilibrium in at least one other market in the economy. In such cases, sectoral balances yield more reliable constraints.

IV Macro-economic Identities and Sectoral Budget Constraints

In effect, therefore, Table 1 summarises the current and capital account transactions of the four principal transactors in an economy, and can be used to formally demonstrate that the national income accounting identities are no more than a series of sectoral budget constraints.

THE NATIONAL INCOME ACCOUNTING IDENTITY

GDP at market prices or the value of goods and services that are produced by the domestic economy can be derived from the basic macro-economic relationship which states that the value of domestic production must be equal to the value of incomes that are domestically generated. From Table 1, two different approaches can be adopted for estimating GDP: the expenditure approach or the value-added approach. From row 1 and column 1, we have:

$$C_g + C_p + X + I_g + I_p = OS_g + D_g + (Ti - Sb) + W + \Pi + D_p + Z \quad \dots(1)$$

GDP at market prices (Ymp) is given by the sum of private consumption (C_p), public consumption (C_g), gross private investment (I_p), gross public investment (I_g) and net exports of goods and services ($X - Z$). Therefore, we have:

$$Ymp = C + I + (X - Z) \quad \dots(2)$$

where $C (= C_p + C_g)$ is total consumption; and $I (= I_p + I_g)$ is total investment.

GDP at factor cost (Yfc) is given by the sum of factor incomes accruing to the private and government sectors, i.e. wages plus profits ($W + \Pi$) and net operating surplus of the public sector (OS_g), as well as depreciation of capital engaged in each sector's production:

$$Yfc = OS_g + D_g + W + \Pi + D_p \quad \dots(3)$$

Substituting eqs (2) and (3) into equation (1) yields:

$$Ymp = Yfc + (Ti - Sb) \quad \dots(4)$$

which implies that GDP at market prices is equal to GDP at factor cost plus net indirect taxes, i.e. indirect taxes (Ti) less subsidies (Sb).

Equation (2) can be rewritten as follows:

$$Ymp + (Z - X) = C + I = A \quad \dots(5)$$

which indicates that the total availability of goods and services in the domestic economy, as given by the sum of output (Ymp) plus the excess of imports (Z) over exports (X) should equal domestic absorption (A) which is equal to consumption (C) plus investment (I). Equation (5) can also be rewritten as follows to reveal one of the many guises of a trade deficit:

$$Z - X = A - Ymp \quad \dots(6)$$

implying that a trade deficit reveals itself in the form of an excess of domestic absorption over domestic production. Equation (6) is of particular interest because it also reveals that if we assume GDP and exports to be fixed in any accounting period, then an increase (reduction) in absorption comes through as an increase (reduction) in imports.

GOVERNMENT BUDGET CONSTRAINT

The basic relationship that must exist between the income and expenditure of any economic agent leads to the derivation

of the government budget constraint. Equating the sum of the entries in row 2 with the sum of entries in column 2 yields:

$$OS_g + D_g + (Ti - Sb) + Td + NTR_{eg} = [C_g + NTR_{gp} + INT_{gp} + INV_{ge}] + S_g \quad \dots(7)$$

which can be rewritten as:

$$Y_g = CEXP_g + S_g \quad \dots(8)$$

implying that the current revenue of the government [$Y_g = OS_g + D_g + (Ti - Sb) + Td + NTR_{eg}$] is equal to current government expenditure ($CEXP_g = C_g + NTR_{gp} + INT_{gp} + INV_{ge}$) plus government savings (S_g).

Equating the sum of entries in row 6 and column 6 indicates:

$$S_g + \Delta DC_g + \Delta B + \Delta F_g = I_g \quad \dots(9)$$

which basically expresses the savings, borrowings and asset acquisition relationship (or the savings constraint) for the government sector: government savings plus net borrowings is identical to the (physical) assets acquired by the government during the accounting period. It needs to be noted that the government's acquisition of foreign assets as well as domestic financial assets (such as loans to the private sector) are netted out from

Notes: (i) The above series could not be extended further because the CSO has not come out with estimates of X, Z and discrepancies for the subsequent years. (ii) The figures in parentheses beneath each discrepancy indicate the corresponding discrepancy as a percentage of GDP at market prices. (iii) The subsequent figures in parentheses indicate the percentage change in the corresponding variable as a result of its adjustment.

foreign borrowings and from domestic borrowings, respectively.

Substituting equation (8) into equation (9) and rewriting the result as follows reveals the sources of financing a government fiscal deficit:

$$(CEXP_g + I_g) - Y_g = \Delta DC_g + \Delta B + \Delta F_g \quad \dots(10)$$

where the expression on the left-hand-side of eq (10) is the gross fiscal deficit of the government. The sources of financing such a fiscal deficit are, therefore, foreign borrowings, direct borrowings from the private sector (provided there is a well-developed capital market) and borrowings from the monetary system.

Equation (10) reveals two possible sources through which excessive government borrowings as a result of high fiscal deficits can crowd out the private sector. Assuming that government borrowing from external sources is restricted in some way, for example, through an IMF conditionality or problems related to creditworthiness or economic sanctions. Under the circumstances, crowding-out can occur either through government borrowing from the private sector because, apart from directly reducing the funds available for private sector investment, this would increase the interest rate or through government borrowing from the monetary system. The latter presumes that there is a ceiling on overall credit expansion of the monetary system, which is often the case in anti-inflationary stabilisation programmes. This explains as to why, in addition to overall domestic credit ceilings, structural adjustment programmes often have sub-ceilings on bank credit to the government in order to prevent crowding-out of private sector investment.

PRIVATE SECTOR BUDGET CONSTRAINT

The private sector budget constraint can be derived by equating the sum of entries in row 3 and column 3 as shown below:

$$W + \Pi + D_p + NTR_{gp} + INT_{gp} + NTR_{cp} + NFP_{ep} = [C_p + T_d + INV_{pc}] + S_p \quad \dots(11)$$

which can be written as:

$$Y_p = CEXP_p + S_p \quad \dots(12)$$

implying that total private sector income ($Y_p = W + \Pi + D_p + NTR_{gp} + INT_{gp} + NTR_{cp} + NFP_{ep}$) equals private consumption ($CEXP_p = C_p + T_d + INV_{pc}$) plus private savings (S_p).

Equating the sum of entries in row 7 and column 7 yields:

$$S_p + \Delta DC_p + \Delta F_p = I_p - \Delta B + \Delta M \quad \dots(13)$$

Substituting equation (12) in equation (13) yields the required private sector budget constraint given by:

$$(Y_p - CEXP_p) + \Delta DC_p + \Delta F_p = I_p + \Delta B + \Delta M \quad \dots(14)$$

which states that private sector income plus borrowings less current outlays equals private sector asset acquisition in the form of money (currency plus demand and time deposits), fixed investment and lending to the government.

EXTERNAL SECTOR BUDGET CONSTRAINT

Equating the sum of entries in row 4 with the sum of entries in column 4 yields:

$$Z + INV_{gc} + INV_{pc} = X + NTR_{eg} + NTR_{ep} + NFP_{ep} + CAD \quad \dots(15)$$

Equating the sum of entries in row 8 with the sum of entries in column 8, and re-writing it in terms of the current account deficit yields:

$$CAD = \Delta F_g + \Delta F_p - \Delta R^* \quad \dots(16)$$

which indicates that a CAD – or positive savings of the external sector – must be financed either by drawing down international reserves or by an increase in net capital inflows (implying an increase in international indebtedness of the domestic economy)

Substituting equation (16) in equation (15) yields:

$$(Z + INV_{gc} + INV_{pc}) - (X + NTR_{eg} + NTR_{ep} + NFP_{ep}) = (\Delta F_g + \Delta F_p - \Delta R^*) \quad (17)$$

where the expressions in parentheses are, respectively, current receipts, current outlays and asset acquisition of the external sector (or, equivalently, negative asset acquisition of the domestic economy). This external sector budget constraint, therefore, states, as expected, that current receipts of the external sector less current outlays equals its asset acquisition.

ASSETS AND LIABILITIES OF MONETARY SYSTEM

As mentioned earlier, because the banking system, being an intermediary, has no independent current revenues or expenditures, row 5 and column 5 are empty. The monetary system does not face a budget constraint per se but rather a balance sheet accounting identity. Equating the sum of entries in row 9 with the sum of entries in column 9 shows:

$$\Delta DC + \Delta R^* = \Delta M \quad \dots(18)$$

where: $\Delta DC = \Delta DC_g + \Delta DC_p$

which states that the assets of the monetary system, in the form of foreign assets (international reserves) as well as credit to the government and the private sectors are equal to its liabilities, in the form of broad money (inclusive of other liabilities of the monetary system).

Equation (18) can be rewritten as follows:

$$\Delta R^* = \Delta M - \Delta DC \quad \dots(19)$$

which states that the change in foreign exchange reserves is equal to the change in the nominal demand for money (assuming that the money market is in continuous flow equilibrium) less the change in total domestic credit. This equation suggests that if the demand for money is held constant, then increases in domestic credit are offset by decreases in reserves on a one-to-one basis. Alternatively, it implies that given a desired level of reserves, and with the demand for money exogenously determined, the required change in domestic credit can be estimated.

SAVINGS-INVESTMENT BALANCE

Summing up the budget constraints of the government and private sectors, i.e., equations (9) and (13), yields:

$$S_g + S_p + \Delta DC_g + \Delta DC_p + \Delta F_g + \Delta F_p = I_g + I_p + \Delta M \quad \dots(20)$$

or, equivalently:

$$S + \Delta DC + \Delta F = I + \Delta M \quad \dots(21)$$

TABLE 6 NATIONAL DISPOSABLE INCOME AND ITS APPROPRIATION

(Rs crore)

Year	National Disposable Income					National Income Appropriation		
	NYmd (1)	NTR (2)	NFP _{ep} (3)	INV (4)	Total (5=1+2+3+4)	C (6)	NS (7)	Total (8=6+7)
1990-91	483339	4538	-246	6732	480899	403095	77804	480899
1991-92	553720	10521	-169	9397	554675	476503	78172	554675
1992-93	632972	12279	-312	10503	634436	552157	82279	634436
1993-94	729197	17669	-1172	10258	735436	633278	102158	735436
1994-95	867114	26726	-1021	10772	882047	730299	151748	882047
1995-96	1009425	29833	-1202	10716	1027340	855923	171417	1027340
1996-97	1146623	45425	-1095	11769	1179184	972550	206634	1179184
1997-98	1269198	45069	-1125	13204	1299939	1092466	207473	1299939

Substituting the external sector budget constraint, given by equation (16), into equation (21) above yields:

$$S + \Delta DC + CAD + \Delta R^* = I + \Delta M \quad \dots(22)$$

Invoking the balance sheet accounting identity of the monetary system, given by equation (18), yields the savings-investment balance:

$$I = S + CAD \quad \dots(23)$$

which states that aggregate domestic investment ($I = I_g + I_p$) is financed by domestic savings ($S = S_g + S_p$) and foreign savings, the latter being synonymous with the current account deficit (CAD). Equation (23) above is identical to the result obtained by equating the sum of entries in row 10 and column 10, thereby indicating that the overall savings-investment balance is a macro-economic budget constraint obtained by summing up all the four individual sectoral budget constraints.

V

Data Sources and Methodology

In this section, we describe the methodology as well as indicate the data sources for computing each of the individual elements of the consistency accounting matrix for the Indian economy over the period 1950-51 to 1997-98. These are then presented, both, in the form of time-series estimates in Table 3 (from 1950-51 to 1996-97) and in matrix form for illustrative purposes in Table 4 (only for 1997-98). It needs to be mentioned that the elements of this flow-of-funds matrix for 1997-98 are provisional estimates – in view of the recent base change and methodological revisions announced by the CSO – although every effort has been made to make them comparable, and thereby preserve continuity, with the earlier time series data.

In such a data gathering process, it is important to recognise some of the practical problems involved in estimating the elements of the consistency accounting framework using a wide variety of macro-economic data which usually conflict with each other. This is because, as mentioned earlier, these statistics draw on four different sets of accounts, i.e., national accounts, fiscal accounts, monetary accounts and BOP accounts, each of them using different accounting methodologies. We therefore have had to choose between competing estimates of the same concept, implying that some items – notably consumption expenditure and gross capital formation – had to be computed as residuals which automatically absorb the measurement errors and methodological

inconsistencies in the accounts in order to preserve inter-sectoral consistency. However, it is seen that the differences between the estimates of these elements, when computed as residuals, and their corresponding actuals, as reported by the various data sources, lay within the ranges suggested by their corresponding 'discrepancy' (for consumption) or 'errors and omissions' (for investment), thereby testifying to the overall robustness of the underlying methodology.

DATA SOURCES

The two major sources used to generate the required data were: (1) The National Accounts Statistics (NAS) of the CSO and (2) The Currency and Finance (CF) of the RBI. However, the following qualifications need to be mentioned: (i) To the extent that the statistics published by the EPWRF (1998) is based entirely on the CSO data set, we have used this single source as the definitive one as far as the national accounts are concerned, supplemented by relevant issues of the NAS, as well as the recently released Press Note on the Quick Estimates of National Income (1997-98), only as and when necessary. However, and this is important, we have not used the CSO/EPWRF estimates of the current account deficit because of certain important methodological differences which persist between the CSO and the RBI in defining the CAD.¹ As such, we have used the RBI sources to obtain estimates of the current and capital account components of the BOP. (ii) In a similar vein, to the extent that the BOP statistics published by the RBI (1993) are based entirely on the RBI data set, we have used this single source as the definitive one as far as BOP statistics are concerned, supplemented by relevant issues of the CF only for the period 1990-91 to 1997-98 which is not covered by the RBI compendium. (iii) Similarly, to the extent that the data on government budgetary operations published by Chandhok et al (1990) are based

entirely on the MoF data set, we have used this single source as the definitive one as far as statistics on government (including state) borrowings are concerned, supplemented by relevant issues of the CF only for the period 1990-91 onwards which is not covered by these Policy Group volumes. (iv) Finally, to the extent that comparable data on the components of money stock from 1950-51 to 1970-71 is available only in Vasudevan (1980), we have used this source to supplement the relevant issues of the CF which publish these components on a regular basis.

The exact sources of data – comprising, both, the specific sources detailed above as well as general sources – used in the estimation of the requisite statistics for the Indian economy are given below (The alphanumeric characters in parentheses after each concerned table/statement refers to the code used to indicate the source later on in Table 2).

BASIC METHODOLOGY

Since the exact adjustment of errors and omissions amongst different elements was not known a priori, only the values of those elements which were known with some degree of precision were substituted initially, and the balancing elements were computed as residuals in order to ensure consistency between row and column totals. The sequential steps followed in estimating the different elements of the flow-of-funds matrix is summarised in Table 2 where each cell has been labelled according to its position in the matrix. Thus, the term R6C2 refers to the cell belonging to the 6th row and 2nd column of the consistency accounting matrix, i.e., S_g . This methodology was used to estimate all the elements of the flow-of-funds matrix for the years 1950-51 to 1996-97 which have then been presented in time series form in Table 3.

The flow-of-funds matrix for 1997-98 presented in Table 4 provides an extension of the time-series estimates and is based on the quick estimates released by the CSO in February 1999. Taking into consideration the base change (from 1980-81 to 1993-94) and methodological revisions (by widening the scope and coverage of sectors included for the computation of

national income and its components), many of these quick estimates were not compatible with the earlier ones. Therefore, we have used only those quick estimates (indicated in Table 2) which are comparable with the earlier ones. In other cases, we have made every effort to preserve the original methodology and extend the original series thereby attempting to ensure comparability of these latest estimates with their earlier counterparts. The nature of these changes have been spelt out clearly in Appendix V. (It needs to be noted that all estimates in Tables 3 and 4 are at Rs crore at current prices).

VI

Consistency Checks

As referred to in Section I, the consolidated accounts of the nation presented in the NAS attempt to summarise the transactions which take place in the economy in the form of production, household and government consumption expenditures, income and outlay, capital formation and capital finance, with the system being closed by the account on external transactions of the nation. However, the Indian NAS presents only partial aspect of the capital finance account (SNA Account 5) in as much as it gives only the details of gross accumulation and its financing but does not incorporate the transactions of financial assets and liabilities. Although the RBI does provide comprehensive annual data on flow-of-funds accounts in this respect (see RBI 1998), because of the independent nature of estimates for macro-economic aggregates based on separate methods and divergent sources of data, it is found that the various accounts do not balance. As it is difficult to pinpoint the specific sources of discrepancies, no attempt is made by the CSO or the RBI to adjust any of the estimates to achieve balance between the different accounts and consequently, the differences are retained as discrepancies or errors and omissions.

In such a context, with the completion of the presentation of the series on all the relevant current and capital account macro-economic aggregates, we now have to ascertain how successful the integration of the various accounts has been. Considering that there are three types of discrepancies in the three main accounts of the SNA,⁴ viz, (i) gross domestic product and expenditure account, (ii) national disposable income and its appropriation account, and (iii) the current and capital finance account, we shall need to examine each

of these accounts individually in order to substantiate our claim regarding the overall consistency of our macro-economic accounting framework.

GROSS DOMESTIC PRODUCT AND EXPENDITURE ACCOUNT

In the first consolidation of accounts of the nation (SNA Account 1), estimates of GDP at current market prices (Y_{mp}) based on production are linked with the key expenditure components of GDP comprising government and final consumption expenditure (C_g and C_p), public and private sector gross capital formation (I_g and I_p), and the net exports of goods and services ($X - Z$). However, these two sets of estimates have invariably exhibited large and growing discrepancies and it has been noted that the estimate of GDP based on the production and income methods which is treated as the controlling total generally tends to exceed total expenditures on consumption, capital formation and net exports – all derived through the expenditure method. Though there is some overlap, the two sets of data are largely independently estimated and there is no way of locating the exact sources of these discrepancies. Neither is there any firm way of stating that one set of estimates is necessarily superior to the other. Thus, in the consolidated accounts of the nation, the discrepancies are retained and no attempt is made to apportion these errors amongst the individual components.

We therefore replicate this account using our data series and the results (Table 5) highlight that once GDP derived from the production and income methods is assumed to be the controlling total, then our methodology indicates how the CSO discrepancies can be precisely apportioned between public and private consumption, public and private investment, and exports and imports of goods and services. The following broad patterns which are seen to emerge as a result of such an apportionment should hopefully suggest guidelines for future refinements and improvements in data collection and methodological revisions.

The first pattern is that discrepancies, after declining continuously from -2.7 per cent of GDP in 1960-61 to -0.2 per cent of GDP in 1985-86, have started increasing rapidly, amounting to 6.3 per cent of GDP in 1995-96.⁵ This reflects poorly on the methodology used by the CSO in estimating GDP based on production and income methods, and suggests the use of alternative controlling totals. Second, it is seen that public consumption has been underestimated to an average extent of

almost 35 per cent since 1990-91 which is extremely alarming, considering that even the former (under)estimates of C_g bordered on profligacy and warranted a fiscal correction. The extent of upward adjustment in the case of imports is also considerable (averaging almost 15 per cent since 1990-91) which however could be because of the differences between the RBI and the CSO in estimating its components. However, interestingly enough, in the case of exports, despite suffering from the same methodological limitations, the error component seems to have stabilised at about 1.7 per cent.

Thirdly, it needs to be noted that as far as gross investment is concerned, the CSO obtains its controlling total by aggregating gross domestic savings and the CAD. However, as has been noted in EPWRF (1998:16), "... it is this adjusted estimate of GDCF that is treated as the official estimation of aggregate gross investment each year, though assetwise and institution-wise distributions of GDCF continue to be based on the unadjusted series because there is no plausible way of distributing the 'errors and omissions' amongst assets or sectors". However, it is noticed that our methodology does seem to be a plausible way of distributing the 'errors and omissions' amongst the two sectors, public and private, although not amongst assets. It is seen that since 1990-91, the CSO estimates of public and private sector investment have been largely biased downwards, requiring an average upward adjustment of about 7 and 3 per cent, respectively. What is important in this context is that the noise component for both the series seems to have increased substantially over the last three years although, to an extent, the discrepancies for the more recent period would be corrected as additional information becomes available.

Finally, as far as private consumption is concerned, the pattern indicates that C_p has been persistently overestimated by the CSO right from 1960-61 to 1990-91, with the downward adjustment reaching a trough of -8.5 per cent in 1978-79. This phenomenon, first noticed by Minhas and Kansal (1989, 1990), also corroborates the conclusion reached by the EPWRF (1998:37), "Thus, the PFCE estimates thrown up by the national accounts represent, to the extent of the divergence, overestimates of private consumption expenditure". However, and this is important, such a pattern of divergence undergoes a complete switch after 1990-91 what with the results indicating that thereafter C_p has been persistently underestimated by the

CSO from 1991-92 to 1996-97, with the upward adjustment reaching a peak of 8.2 per cent in 1995-96. This dramatic *volte face*, largely a reflection of the fact that after liberalisation the estimates of GDP obtained from the income/production side, which are used as the controlling total, have persistently and ever-increasingly outstripped the estimates of GDP obtained from the expenditure side, is an indicator that unless the superiority of this controlling total is clearly established, the CSO could be seriously overestimating GDP. On the other hand, if the controlling totals are indeed accurate, then unless we adjust C_p upwards by using the above methodology, then we could be seriously underestimating consumption and therefore domestic absorption which is a key determinant of reserve accretion.

NATIONAL DISPOSABLE INCOME AND ITS APPROPRIATION

In the second consolidation of accounts (SNA Account 3) relating to national disposable income and its appropriation, estimates of NDP at market prices combined with factor incomes plus current transfers from abroad are linked to the total of final consumption and net savings. However, these two estimates have also exhibited discrepancies of about the same order of magnitude as that in SNA Account 1, and it has been noted that the former estimate which is treated as the controlling total has generally tended to exceed the latter estimate. This is because in the estimation procedure, net savings include household savings in financial assets as well as public sector and corporate sector savings whose estimates are independent of the components appearing in the first consolidation. As there is no firm way of asserting which set of estimates is superior to the other, the discrepancies are retained while presenting the consolidated accounts of the nation by the CSO. Before replicating such an account using our data series in order to establish the possible sources of error, we initially derive the components which link national disposable income and its appropriation.

To do so, we add eqs (7) and (11) together and equate the sum of the left-hand-side elements with the corresponding sum of the right-hand-side elements, to obtain:

$$NYmp + NTR + NFP_{ep} - INV = C + NS \quad (24)$$

where $NYmp [= OS_g + (W + \Pi) + (Ti - Sb)]$ is NDP at current market prices, $NTR (= NTR_{eg} + NTR_{ep})$ is total net transfers from abroad, $INV (= INV_g + INV_p)$ is total

net investment income, $C (= C_g + C_p)$ is total consumption expenditure and $NS [= (S_g - D_g) + (S_p - D_p)]$ is net savings. The consistency of equation (24), which states the exact nature of the relationship between total disposable income and its appropriation, is illustrated for recent years in Table 6.

It has been noted that the statistical discrepancies reported by the CSO in their SNA Account 3, i.e., the excess of national disposable income (NDI) over its appropriation components (C and NS), have increased from 1.8 per cent of GDP in 1990-91 to 7.6 per cent of GDP in 1995-96 (see EPWRF 1998, Exhibits 6(B) and 6(E), pp 52-53). The above consistency check helps to identify the three sources which have contributed to these rising discrepancies: (i) the CSO uses unadjusted estimates of total consumption ($C_g + C_p$) which are about 8.5 per cent lower than their adjusted counterparts. This underestimate automatically imparts a downward bias to the appropriation component of NDI and is the single largest contributor to the overall statistical discrepancy. (ii) the CSO uses estimates of 'property and entrepreneurial income from the rest of the world' instead of net investment income (which is a more accurate indicator of resource outflows from government and private sector incomes largely on account of interest payments on government sector external debt and private sector external liabilities, respectively). As the former estimates are about 10 per cent higher than the latter, this biases the CSO estimates of NDI downwards. (iii) the CSO does not include NTR_g in their computation of NDI⁶ and therefore their estimates of NTR in eq (24) above includes only NTR_{ep} . As NTR is about 40 per cent higher than NTR_{ep} , this further biases the CSO estimates of NDI downwards. Because of error components (ii) and (iii), it is seen that our estimates of NDI are marginally (about 0.8 per cent) higher than those of the CSO. Once this upward adjustment is made in the controlling total, then the use of our adjusted estimates of total consumption indicates that the two totals must invariably balance.

CAPITAL FINANCE ACCOUNT

In the third consolidation of accounts (SNA Account 5) which concerns the capital finance account, the financial sources for gross accumulation (domestic savings and capital inflows from abroad) are linked to the total of institutionwise (public sector, private corporate sector and household sector) estimates of gross

domestic capital formation (GDCF) which are derived independently. Because the former estimate ($I = S + CAD$) is decidedly superior on theoretical considerations, it is treated as the controlling total although the difference between these two estimates, which is described as 'errors and omissions', is retained as a separate entity by the CSO while presenting the consolidated accounts of the nation because of its inability to actually adjust the latter sectorwise estimates of investment on the basis of the controlling total. However, as shown in Table 5, our methodology does provide a plausible way of apportioning these errors and omissions amongst the public and private sectors.

In this section, we provide an empirical (as opposed to theoretical) consistency check on these estimates by examining their robustness. In order to do so, we adopted the following methodology. For each year of the sample period, we initially used the CSO unadjusted estimate of public sector gross domestic capital formation and then added to it the corresponding total errors and omissions for that year (derived in the manner described above⁷) in order to obtain two estimates of sectoral GDCF for each year which automatically provided a range demarcated by its minimum and maximum bounds.⁸ We then examined whether or not our independently derived estimate of public sector gross investment lay within these bounds. The same procedure was repeated for private sector investment.

This exercise was carried out for each year of the sample period and the results are plotted on a logarithmic scale in Figure 1.1 (public sector investment) and Figure 1.2 (private sector investment), where the shaded gray lines indicate the minimum and maximum bounds for each year and the dark black line indicates our estimate of sectoral gross investment. With overall GDCF fixed by its controlling total, any variation in I_g was mirrored by I_p implying that an overprediction in any one sector implied an underprediction in the other, and vice versa. The results show that, apart from a brief zone of instability during the early 1950s when estimated I_g lay far below its minimum bound, there have not been any other extreme outliers in either series. Overall, it is seen that estimates of both I_g and I_p lay exactly within their designated ranges for 21 out of the 48 years of the sample period, with the average error ranging from -11.1 percent to +5.2 per cent for I_g ; and from -1.5 per cent to +6.7 per cent for I_p , thereby

testifying to the overall robustness of our methodology.

These minor discrepancies notwithstanding, one significant implication of these adjusted investment estimates is that it does serve to define the size of gross investment in the country on which there has been considerable debate because it has been argued [Rakshit 1983] that the actual level of investment should be obtained residually as the difference between GDP on the one hand, and government and household consumption combined with net imports on the other, i.e., $I = Y_{mp} - C_g - C_p + Z - X$. Our methodology not only shows that doing so would result in serious overestimates of GDCF, but also suggests a superior alternative which establishes that by appropriately adjusting the expenditure components of GDP (as indicated in Table 5), the above indirect estimate of investment would be exactly identical to its controlling total (i.e., $S + CAD$), and therefore it makes no difference as to which procedure we adopt in order to estimate gross investment.

CAPITAL FLOWS, CREDIT EXPANSION AND DOMESTIC ABSORPTION

In this final consistency check, we provide a fourth possible consolidation of accounts, not attempted by the CSO, where estimates of GDP at market prices combined with factor incomes plus current transfers from abroad less net investment income are linked to capital inflows, domestic absorption and credit expansion. The derivation of these linkages is obtained by adding together equations (6) and (17), re-arranging terms, and then using equation (19). This yields the following relationship between the current and capital accounts of the nation:

$$(Y^* + \Delta F) - A = \Delta M - \Delta DC = \Delta R^* \quad \text{.. (25)}$$

where:

$$Y^* = Y_{mp} + (NTR_{eg} + NTR_{ep} + NFP_{ep}) - (INV_{gc} + INV_{pc})$$

$$\Delta F = \Delta F_g + \Delta F_p$$

$$A = (C_g + C_p) + (I_g + I_p)$$

The expression in parentheses on the left-hand-side of equation (25) indicates the total resources available for domestic consumption and investment. The above equation thus indicates that domestic absorption (A) will exceed total available resources ($Y^* + \Delta F$) by the amount that domestic credit expansion (ΔDC) exceeds the flow demand for (equal to the supply of) money (ΔM). The identity also reveals

that with total resources as well as the flow demand for money remaining fixed, any reductions in domestic credit will automatically improve the BOP, i.e., increase reserves, by reducing absorption. In Table 7, we have examined the consistency of the above equation for a few selected years of the sample.

Table 7 indicates very clearly that whenever domestic absorption has exceeded total available resources, foreign exchange reserves (denoted in col 7 by the difference between ΔM and ΔDC) have decreased, and vice versa. This inverse relationship between domestic absorption, comprising consumption and investment, and reserve accretion, implies that any underestimation of these expenditure components would, by overpredicting reserve accretion, conceal the possibility of a BOP crisis until it is too late. This clearly highlights the need for a more careful monitoring and estimation of the expenditure components of GDP.

VII Conclusions

This study presents for the first time in the Indian context a consistent set of annual macro-economic data from 1950-51 to 1997-98 by integrating the national accounts statistics of the CSO with the BOP and monetary data of the Reserve Bank of India as well as with the fiscal data of the government of India. This is done by using a consistency accounting matrix which specifies the linkages between sources and uses of funds as well as between institutional sector accounts. It is seen that the resulting framework ensures the numerical consistency of data drawn from different sources in such a way that, both the sectoral budget constraints as well as the overall economywide budget constraints are simultaneously satisfied.

In this context it needs to be noted that the base change and methodological revisions carried out by the CSO in February 1999 has, to a very large extent, rendered the revised national accounts statistics from 1993-94 onwards incompatible with their corresponding estimates for the earlier period. Because of the complexities involved in backcasting the impact of these methodological revisions, the CSO intends to extend the new series backwards only until 1980-81, implying that henceforth we would have a truncated series on the national accounts; one from 1950-51 to 1979-80 with 1980-81 as the base, and the other from 1980-81 onwards with 1993-94 as the base, with no way of reconciling these two sets of estimates,

apart from using a statistical 'blow-up' factor, because of the methodological incompatibilities between them. Under the circumstances, this could be the last possible complete and compatible data set on the national accounts with a common base and methodology.

Despite certain problems left unresolved by our exercise, we have to a large extent succeeded in integrating the various macro-economic aggregates which, in turn, can help to detect the structural changes that have occurred in the real and financial sectors of the Indian economy over the entire sample period, in general, and between the pre- and post-liberalisation phases, in particular.

This would hopefully enable researchers to translate the implied interrelationships into various policy relevant solutions for some of the urgent structural adjustment problems confronting the Indian economy currently.

With many developing countries irrevocably committed to liberalisation, the issues of the optimal sequencing of reforms, in general, and the manner in which the real and financial sectors can be expected to interact with and respond to the domestic and external sectors, in particular, is becoming increasingly important. Only when all these interactions are well understood will it be possible to predict the effects of policy-relevant variables such as interest rates, exchange rates, capital inflows, amongst others, on key macro-economic outcomes such as inflation, international reserves, savings, investment, fiscal deficits, BOP, income distribution and, above all, economic growth, keeping this in mind, we have compiled the data and, in the second part of the paper (to be published in the forthcoming issue of the *EPW*), we have carried out detailed investigations in order to identify certain relevant empirical patterns and regularities in the estimated data series. In concluding, we do hope that our effort in providing a consistent set of macro-economic data provokes interest in this relatively neglected area of methodological research. After all, this is the only plausible way to determine objectively the success or otherwise of any set of macro-economic stabilisation and structural adjustment policies that have been implemented.

Appendix I

Estimating Net Operating Surplus of the Government

The estimates of net operating surplus of the government (OS_g) were obtained from two different sources: (i) EPWRI

(Table 24: Item 2.1) for the period 1980-81 to 1995-96 and (ii) various issues of the CSO (*Statements: Factor Incomes of Public Sector/Factor Incomes of Public Sector by Type of Economic Activity*) for the period 1960-61 to 1983-84. However, these two data series were incompatible with each other because the CSO revised the methodology for computing OS_g in 1985 and thereafter published only the revised series (from 1980-81 onwards) which has been reproduced in the EPWRI. Thus, there existed no comparable estimates of OS_g for the period 1960-61 to 1979-80; and, indeed, no estimates whatsoever for the period prior to 1960-61. To obtain a comparable and consistent data series on OS_g for the entire period 1950-51 to 1997-98, we resorted to the following methodology.

Initially, the two series were spliced together by regressing the new series of OS_g expressed as a percentage of net domestic product at current factor prices (NDPfc) on the corresponding estimates based on the old series of OS_g using data for the period 1980-81 to 1983-84 (i.e., the only four years for which overlapping data on OS_g using, both, the old and new methodologies were made available by the CSO). The estimated equation was then used to interpolate the revised OS_g /NDPfc ratios for the period 1960-61 to 1979-80 based upon which comparable estimates of OS_g for this period were derived by using the actual estimates of NDPfc for each of these years.

Then, in order to extrapolate the estimates of OS_g for the period 1950-51 to 1959-60, we assumed that there existed a long-run stable relationship between OS_g and NDPfc, with the short-run dynamics of OS_g being governed by an error correction mechanism (ECM). The estimated backward-recurrence equation – using sample data over the period 1960-61 to 1973-74 (during which time the ratios OS_g /NDPfc were relatively stable as they varied only within a narrow range of 1.2 to 1.8 per cent) and invoking the Engle-Granger (see Engle and Granger 1987) method⁹ – was given by:

$$OS_g(t) = 0.2950 OS_g(t+1) + 0.011578 NDPfc(t) + 0.000939 NDPfc(t+1) - 39.34 \dots (A1.1)$$

Equation (A1.1) was used to extrapolate OS_g backwards in time, for the period 1959-60 to 1950-51, using data on OS_g for 1960-61 as the initial condition, along with the data on NDPfc over this period.

Finally, as the new series of OS_g was available only up to 1995-96, we had to generate forecasts for the subsequent years as well. To do so, we estimated a forward-recursive ECM (using sample data over

the period 1980-81 to 1995-96) which was given by:

$$OS_g = -0.3184 OS_g(t-1) + 0.0929 NDPfc(t) - 0.0170 NDPfc(t-1) - 7102.6 \dots (A1.2)$$

Equation (A1.2) was used to extrapolate OS_g forwards in time, for the period 1996-97 and 1997-98, using data on OS_g for 1995-96 as the initial condition, along with data on NDPfc for these two years (It needs to be noted that the CSO quick estimate of NDPfc for 1997-98 could not be directly utilised for this purpose because the methodological revisions carried out made it incompatible with the earlier ones. The details of computing a comparable estimate of NDPfc for 1997-98 is described in Appendix V).

Appendix II

Estimating the Intersectoral Distribution of Investment Income

The estimates of net investment income of the government sector (INV_{gc}) and the private sector (INV_{pc}) were available only for the period 1956-57 to 1989-90 (Source: RBI – Table 10.3) because the RBI discontinued publishing this data after 1989-90 due to methodological difficulties. Thus, although there existed estimates of net aggregate investment income (INV), i.e., the difference between total payments (PINV) and total receipts (RINV), there were no data on the intersectoral break-up of this net outflow of resources into INV_{gc} and INV_{pc} for the two phases 1950-56 and 1990-98.

To obtain this data, we initially assumed that the payments component of INV_{gc} , denoted by $PINV_{gc}$, was a function only of interest payments on the external debt (INT_{gc}) which was a reasonable assumption considering that INT_{gc} is the largest component of government payments under this category. We then used data over the period 1956-57 to 1963-64 and estimated the following backward recurrence ECM:

$$PINV_{gc}(t) = -0.1724 PINV_{gc}(t+1) + 0.9190 INT_{gc}(t) + 0.2567 INT_{gc}(t+1) + 2.0261 \dots (A2.1)$$

Equation (A2.1) was used to backcast $PINV_{gc}$ for the period 1955-56 to 1950-51 using data on INT_{gc} (Source: Chandhok – Table 3.24: *Burden of Foreign Debt in India*) over this period. This series was then subtracted from total investment income payments abroad, i.e., PINV (Source: RBI: 1. *Item II.4-Debits*) to derive time series estimates of investment income payments by the private sector to the external sector, i.e., $PINV_{pc}$ ($= PINV$

– $PINV_{ge}$). On the basis of trends prevailing during the period 1956-57 to 1962-63, it was assumed that private sector investment income receipts from abroad, i.e., $RINV_{ep}$, would be around 30 per cent of total investment income receipts from abroad, i.e., $RINV$ (Source: RBI: 1, *Item 11.4-Credits*). The resulting estimates of $RINV_{ep}$ ($= 0.3 RINV$) were then deducted from total investment income receipts to arrive at estimates of government investment income receipts from abroad, i.e., $RINV_{eg}$ ($= RINV - RINV_{ep}$). The series of investment income receipts from abroad of both the government as well as the private sector derived in this manner were then deducted from their corresponding payments estimates to compute the series of net investment income of both the sectors as follows: $INV_{ge} = PINV_{ge} - RINV_{eg}$ and $INV_{pe} = PINV_{pe} - RINV_{ep}$.

To obtain estimates of INV_{ge} and INV_{pe} for the period beyond 1990-91, we used data over the period 1982-83 to 1989-90 and estimated the following forward recurrence ECM:

$$\begin{aligned} PINV_{ge}(t) = & -0.2618 PINV_{ge}(t-1) \\ & + 1.6258 INT_{ge}(t) - 0.4162 INT_{ge}(t-1) \\ & + 64.53 \end{aligned} \quad \dots(A2.2)$$

Equation (A2.2) was used to forecast $PINV_{ge}$ for the period 1990-98 using data on INT_{ge} (Source: CF – Statement: Interest Payments by the Central Government). As before, these estimates were then deducted from $PINV$ (Source: CF: BOP, *Item 11.c-Debits*) to derive estimates of $PINV_{pe}$. On the basis of trends prevailing over the second half of the 1980s, it was then assumed that $RINV_{ep}$ would be around 5 per cent of $RINV$ (Source: CF: BOP, *Item 11.c-Credits*). The resulting estimates of $RINV_{ep}$ ($= 0.05 RINV$) were then deducted from $RINV$ to obtain estimates of $RINV_{eg}$. Finally, these intersectoral estimates of investment income receipts were deducted from their corresponding payments estimates to compute the series of net investment income of both these sectors for the period 1990-91 to 1997-98.

Appendix III

Estimating Net Factor Payments from Abroad

The estimates of net factor payments from abroad (NFP_{ep}) – which forms a part of net miscellaneous receipts under the invisibles component of the current account of the BOP – were derived by deducting payments for 'Professional and Technical Services (PTS)' from the cor-

responding receipts. However, such a break-up was available only for the period 1956-57 to 1989-90 (Source: RBI: 10.5, *Items 1 and 2: Payments and Receipts*). Because the resulting series of NFP_{ep} matched with the series of net compensation of employees from the rest of the world (Source: CSO: *Statement: Consolidated Accounts of the Nation: Account 6 – Item 6.2 minus Item 6.8* and EPWRF: *Exhibit 6-D*) from 1970-71 onwards, this source was used to extend the series albeit only until 1995-96 as no further data was available. To extrapolate NFP_{ep} for the subsequent period, it was observed, on the basis of recent trends, that: (a) NFP_{ep} was about 8.4 per cent of net factor income (NFI) from abroad (Sources: EPWRF: 2, Col 18, CSO(QE): *Statement 1 – Items 1.1 minus 2.1*), and (b) the receipts/payments ratio for PTS was about 0.21. Thus, the estimates of NFI yielded NFP_{ep} which, by using this ratio, yielded the credit and debit components of PTS. Deducting the former from the latter yielded annual estimates of NFP_{ep} for the period 1996-97 to 1997-98. In order to derive the estimates of NFP_{ep} for the period prior to 1956-57, we initially computed the average ratio of receipts (payments) for PTS to total miscellaneous receipts (payments) using data over the period 1956-61 and then applied it to the corresponding miscellaneous receipts (payments) for each year of the earlier period (Source: RBI: 1, *Item 11.6 – Credits/Debits*). We thus obtained yearly estimates of payments and receipts for PTS from which we derived NFP_{ep} for the period 1950-51 to 1955-56.

Appendix IV

Estimating Domestic Borrowings and Government Investment: A Note

The estimates of domestic borrowings by the government (ΔB) were obtained by adding together net market borrowings of the centre (Source: CF: BOP) and net market borrowings/loans of the states (Source: Chandhok: 3.5). It was seen that the resulting series, when used in equation (9), yielded remarkably accurate estimates of gross public sector investment (I_g) for the period 1950-51 to 1989-90. However, for the post-liberalisation phase, owing to changes and revisions in the components of ΔB , the above equation was unable to replicate I_g equally well. As such, for the period 1990-91 to 1997-98, we switched the sequence of estimation of these two variables: in effect, rather than estimating ΔB initially and then computing I_g as a residual, we estimated I_g initially and then computed ΔB as a residual. Thus, we ini-

tially used equation (10), which indicated that the gross fiscal deficit (GFD) is the difference between government investment and government savings (S_g), and thereby re-defined I_g as the sum of S_g plus the GFD of the centre plus the GFD of the states less the loans from the central government to the state governments (Sources: RBI Annual Report (1997-98), *Table IV.4: Financing of the Gross Fiscal Deficit of the Central Government*; *Table IV.8: Financing State Government's Gross Fiscal Deficit, Item 5 and Item 2*). It was noted that the resulting estimates of I_g for the period 1990-98 were just as accurate as the earlier estimates and the consistency check provided in Section 6.4 bears out this contention. Then, by rewriting equation (9) in terms of ΔB , we estimated this variable as a residual and it was observed that the resulting series lay within the neighbourhood of the sum of net market borrowings of the centre and states, testifying to the robustness of this revised methodology.

Appendix V

Estimating the Consistency Accounting Matrix for 1997-98

As mentioned earlier, in order to obtain comparable estimates of the consistency accounting matrix for 1997-98, the methodology discussed in Section 5.2 was extended so as to incorporate the quick estimates recently released by the CSO. However, taking into consideration the base change and the methodological revisions, some of these quick estimates for 1997-98 were not comparable with the earlier values and therefore needed to be modified to ensure comparability. The nature of these modifications is spelt out below.

Initially, the growth rate in GDP at factor cost at current prices (Yfc) of 11 per cent in 1997-98 (QE: 3.2 – *Item 10*) was applied to the existing (pre-revised) estimate of Yfc for 1996-97 to arrive at a comparable estimate of Yfc for 1997-98. To this we added indirect taxes less subsidies, i.e., $Ti - Sb$ (QE: 9 – *Item B.10 less Item A.3*) to arrive at comparable estimates of GDP at current market prices (Ymp).

Then, using sample data over the period 1993-94 to 1996-97, the existing estimates of total depreciation (D) were regressed on the revised estimates of total depreciation (QE: 6 – *Item 2*) in order to obtain the statistical relationship between them. This equation was then used to extrapolate the value of depreciation for 1997-98 (using the revised estimate of depreciation for this year as the regressor) which would

be comparable with its earlier values. We then estimated the average ratio of depreciation in the public sector (D_g) to total depreciation (i.e., D_g/D), based upon data over the above four-year period, and applied it to this estimated value of total depreciation in order to obtain a compatible estimate of D_g which, in turn, yielded a comparable estimate of depreciation in the private sector (D_p) as a residual. This estimate of total depreciation obtained above was then deducted from Y_{fc} (as derived earlier) in order to obtain the comparable estimate of net domestic product at factor cost at current prices (NDP_{fc}) for 1997-98 which, in turn, was used to extrapolate the net operating surplus of the government (OS_g) for this year on the lines discussed in Appendix I. The sum of OS_g plus D_g plus $(Ti - Sh)$ yielded the share of the government in GDP at market prices (Y_{mpg}). In a similar manner, the estimate of OS_g obtained above was then deducted from NDP_{fc} (as derived earlier) in order to obtain private sector factor income, i.e., the sum of wages plus profits ($W + \Pi$), residually. The sum of $(W + \Pi)$ plus D_p yielded the share of the private sector in GDP at factor cost (Y_{fc}).

Finally, using sample data over the period 1993-94 to 1996-97, the existing estimates of gross domestic savings (S) were regressed on their revised estimates (QE: 1 - Item 1) in order to obtain the statistical relationship between them. This equation was then used to extrapolate the value of total savings for 1997-98 (using the revised estimate of savings for this year as the regressor) which would be comparable with its earlier values. We then used the revised ratio of gross savings in the public sector (S_g) to total savings (i.e., S_g/S) for 1997-98 (QE: 8 - Item 2) and applied it to this estimated value of total savings in order to obtain a compatible estimate of S_g which, in turn, yielded a comparable estimate of gross savings in the private sector (S_p) as a residual. The remaining elements of the consistency accounting matrix were estimated using exactly the same methodology as discussed in Table 2.

(To be concluded)

Notes

- 1 These projections are obtained recursively - implying that each successive projection is based on certain earlier projections - as follows (It needs to be noted that all the symbols and identities used in this exercise have been explained later): (i) As $I = S + CAD$; and with I projected to increase from 25 to 35 per cent and CAD projected to decline from 2 to 1 per cent, it implies that S must increase from 23 to 34 per cent. (ii) As $I = I_g + I_p$; and I_g expected

to remain constant at 10 per cent, it implies that I_p must increase from 15 to 25 per cent. (iii) As $FD = I_g - S_g$; and with FD projected to decrease from 6 to 0 per cent, it implies that S_g must increase from 4 to 10 per cent. (iv) As $S = S_g + S_p$, it implies that S_p must increase from 19 to 24 per cent. (v) As $S_g = T - C_g$, and with C_g expected to remain constant at 15 per cent, it implies that T must increase from 19 to 25 per cent. (vi) As $YD = Y - T$, it implies that YD must decrease from 81 to 75 per cent. (vii) As average propensity to save (aps) = S_g/YD ; it implies that aps must increase from 23.5 (= 19/81) to 32 (= 24/75) per cent. (viii) Finally, assuming that $Y(0) = 100$, and given the growth and inflation projections (7 and 6 per cent), it implies that $Y(5) = 188$ at the end of the five-year planning horizon. This implies that $YD(5) = 141$ (which is 75 per cent of Y) while $S_g(5) = 45$ (which is 24 per cent of Y). As marginal propensity to save (mps) = $\Delta S_g/\Delta YD$, it implies that mps = $(45 - 19)/(141 - 81) = 44$ per cent.

- 2 These projections are obtained recursively as follows: (i) As inflation (π) = money growth (μ) - real growth (g), it implies, given that g is expected to increase from 5 to 7 per cent and π is expected to remain constant at 6 per cent, that μ (= $\Delta M/M$) must increase from 11 to 13 per cent. (ii) As 60 per cent of private savings goes into financial asset accumulation, it implies that

$$\Delta M + \Delta B = 0.6 S_p \quad (F2.1)$$

which, by dividing throughout by Y and letting $\Delta M/Y = (\Delta M/M)(M/Y) = \mu(M/Y)$, yields

$$\Delta B/Y = 0.6 (S_p/Y) - \mu(M/Y) \quad (F2.2)$$

Given the earlier projections of S_p/Y and μ , along with the fact that the income velocity (Y/M) is assumed to be 1.5, implies from equation (F2.2) that government borrowing ($\Delta B/Y$) would increase from 4 to 5.7 per cent.

(iii) Let the steady state initial ratio of financial assets to GDP be denoted by x , i.e., $(M + B)/Y = x$, implying that $\Delta M + \Delta B = x \Delta Y$. Substituting this result in equation (F2.1), and dividing throughout by Y , yields

$$x(\Delta Y/Y) = 0.6(S_p/Y) \quad (F2.3)$$

Substituting the projection for S_p/Y and considering that $\Delta Y/Y = 0.113$ (given that initial g and π are 5 and 6 per cent, respectively) yields $x = 1$, implying that the steady state ratio of financial assets to GDP is 100 per cent. (iii) Now by setting the variables in equation (F2.3) at their terminal levels yields $x = 1.07$ implying that the new steady state value of financial assets to GDP which is consistent with the terminal savings and growth rates is 107 per cent. (iv) As the steady state ratio of $(M + B)/Y$ increases from 1 to 1.07, while $M/Y = 1/1.5 = 0.67$ is assumed to remain constant, this implies that the debt-GDP ratio (B/Y) increases from 0.33 to 0.4. (v) As $FD = iB + x.Y$, where FD is the fiscal deficit, iB represents interest payments on internal debt and x is the ratio of the primary deficit/surplus to GDP. Also, with only two sources of financing the fiscal deficit, we have $FD = \Delta DC_g + \Delta B$. Linking these two equations together, and dividing throughout by Y , yields

$$f = FD/Y = i(B/Y) + x = (\Delta DC_g/Y) + (\Delta B/Y) \quad (F2.4)$$

Equation (F2.4) has two implications. Firstly,

given that f is projected to decrease from 6 to 0 per cent, i is expected to remain at 10 per cent, and B/Y is expected to increase from 33 to 40 per cent, it implies that x must decrease from 2.7 per cent to -4 per cent. Secondly, given the projections of f and $\Delta B/Y$, it implies that $\Delta DC_g/Y$ must decrease from 2 per cent to -5.7 per cent. (vi) Finally, with capital flows assumed to be zero, and private savings financing 60 per cent of financial asset accumulation, it implies that the remaining 40 per cent of private savings, supplemented by private sector credit, must finance private investment. Thus, the private sector investment constraint is given by $I_p = 0.4 S_p + \Delta DC_g$. Given the above projections of S_p/Y and I_p/Y , indicates that private sector "credit entitlement" ($\Delta DC_g/Y$) must increase from 7.4 to 15.4 per cent.

- 3 The first is the difference between the figures of merchandise exports and imports from the two sources, namely the RBI and the DGCI and S, which represent timing, valuation and such other differences as between the recordings of export-import data at the time of shipment (DGCI and S) and at the time of payment (RBI). To the extent that the CSO largely depends upon the latter source, their estimates of the CAD differ from those of the RBI. However, the more important methodological difference is that the CSO excludes net official transfers (NTR) from the computation of the CAD, while the RBI, following the IMF practice, includes it. Thus, to the extent that NTR has been consistently positive, the CSO estimates of the CAD have been persistently, albeit marginally, higher than those of the RBI. As the RBI stance is the more appropriate one, we have depended entirely upon the RBI sources for estimating the BOP and all its components, using CSO data only on net factor income from abroad (NFP_{op}) which, in any case, is not provided by the RBI.

- 4 Apart from these three main discrepancies, there are two other subsidiary discrepancies. First, there is a discrepancy in estimates of capital formation undertaken separately by type of institutions and type of economic activity, and there is yet another discrepancy in the external transactions account which, however, is shown as adjustment of merchandise exports and imports, this is the difference between the figures of merchandise exports and imports from the two sources, namely the RBI and the DGCI and S (this point has been referred to in the earlier footnote). Sizeable errors and omissions do occur in the external sector data which are hidden under capital transactions and not reported separately in the NAS. The RBI does report the data on 'errors and omissions' in its regular BOP statistics (see Table 44 in RBI Bulletin, October 1998). However, in our study, we make no attempts to reconcile these subsidiary discrepancies.

- 5 As a matter of fact, discrepancies amounted to 0.0 per cent of GDP in 1987-88 after which they have been persistently and increasingly positive. However, it needs to be noted that, after the recent CSO revisions, these discrepancies did decline significantly, thereby testifying to an improvement in their methodology. Unfortunately, these discrepancies have increased with every passing year just as before

and, at present, the post-revision percentage discrepancy is at the level that it was in 1995-96 prior to the revision. The following table highlights this feature

Year	CSO Discrepancies (as Per Cent of GDP)	
	Old Base (1980-81)	New Base (1993-94)
1993-94	6.7	3.1
1994-95	5.5	3.1
1995-96	6.3	4.7
1996-97	-	4.7
1997-98	-	6.2

6 This is a direct corollary of the fact that the CSO does not include NTR_{1t} in the computation of CAD

7 The source for both these estimates was *Economic Survey (1998-99)* Table 1.4 - Gross Domestic Savings and Capital Formation. In this context, it needs to be noted that the 'errors and omissions' reported here was adjusted to take into consideration the methodological differences between the CSO and the RBI in computing the CAD. As the RBI estimates of CAD are slightly lower than their CSO counterparts because of the incorporation of NTR_{1t} by the former in its computation, the controlling total ($I - S + CAD$) used by us was also lower. Thus, our estimate of 'errors and omissions' defined as the difference between the controlling total and the independently derived sectoral estimates of GDCF was lower than those reported by the CSO

8 Thus, if the corresponding error happened to be positive (negative), then the actual unadjusted estimate of sectoral GDCF would be the lower (upper) bound and its adjusted estimate, i.e., actual GDCF plus (minus) error, would be the upper (lower) bound. Because our estimate of 'errors and omissions' was smaller than their CSO counterparts, the overall range was smaller implying a more stringent test for robustness

9 We will illustrate the Engle-Granger method using one explanatory variable (with the extension to a multivariable case being direct). Let the long run relationship between $x(t)$ and $y(t)$ be given by

$$y(t) = a_0 + a_1 x(t) \quad (F1.1)$$

where both $y(t)$ and $x(t)$ are $I(1)$, i.e., integrated of order 1. Assume that for the OLS estimates a_0 and a_1 of equation (F1.1), the Dickey-Fuller (DF) and/or the Augmented Dickey-Fuller (ADF) test indicate stationarity of the residuals $u(t)$. In other words, cointegration of $y(t)$ and $x(t)$ of order (1,1) can be positively accepted, implying that deviations of $y(t)$ from its long-run path are $I(0)$. Logically, the next move would be to switch over to a forward recursive short-run model with an ECM given by:

$$\Delta y(t) = \beta_1 \Delta x(t) + \beta_2 [y(t-1) - \alpha_0 - \alpha_1 x(t-1)] \quad (F1.2)$$

As the dependent variable and both the regressors are $I(0)$, there is no possibility of estimating a spurious regression as a result of stochastic/deterministic trends being present in the data. The model incorporates both a long-run solution as well as a short-run ECM provided $\beta_2 < 0$. The short-run dynamics of the ECM are obtained by re-

writing $\Delta y(t) = y(t) - y(t-1)$ and $\Delta x(t) = x(t) - x(t-1)$ in equation (F1.2) yielding:

$$y(t) = [1 + \beta_2]y(t-1) + \beta_1 x(t) - [\alpha_1 \beta_2 + \beta_2]x(t-1) - \alpha_0 \beta_2 \quad (F1.3)$$

In essence therefore, the Engle-Granger method comprises two steps: first, estimate equation (F1.1) by OLS and test for stationarity of the residuals. Second, if this is not rejected, estimate equation (F1.2) replacing α_0 and α_1 by their previously computed OLS estimates α_0 and α_1 . Under the circumstances, the condition of the identical order of integration for all the variables in equation (F1.2) is satisfied.

If a backward recursive ECM is to be obtained, then we redefine $\Delta y(t) = y(t) - y(t+1)$ and $\Delta x(t) = x(t) - x(t+1)$ while estimating equa-

tion (F1.2). The short-run dynamics of such a backward recursive equation will therefore be given by:

$$y(t) = [1 + \beta_2]y(t+1) + \beta_1 x(t) - [\alpha_1 \beta_2 + \beta_2]x(t+1) - \alpha_0 \beta_2 \quad (F1.4)$$

which would dynamically extrapolate the series $y(t)$ backwards in time. It needs to be noted that we have reported only the final estimated forms of either equations (F1.3) or (F1.4), as the case might be, in the appendices.

Agrarian Distress in Bidar

Market, State and Suicides

A R Vasavi

The spate of suicides by agriculturists in Karnataka was largely a result of ecological, economic and social crises in the region. The situation calls attention to the problems of commercial agriculture in the region and to the role of the state in inducing such conditions. Internal social complexities such as the growth of local usury and the increasing individualisation of agriculture also compound such distress.

I Agrarian Distress

BETWEEN December 1997 and May 1998 23 cases of suicides related to agricultural crop loss were reported from the north Karnataka districts of Bidar and Gulbarga. Of these, 13 suicides were by agriculturists in the district of Bidar, and a significant proportion of these was from Bhalki taluka. Though this study was initiated in response to reports of suicides in the district, the study does not focus on the actual cases/households in which distress-related suicides were reported.¹ Rather, the study considers the suicides to be symptomatic of larger and more pervasive crises in the region. The crises are ecological, economic, and social; each inter-linked with the other, and combining to produce distress in the region. And it is in the context of these crises that the pervasive distress in the region and the suicides by agriculturists must be understood.²

Ecological crisis: The promotion of commercial agriculture, based on the utilisation of hybrid seeds, chemical fertilisers and pesticides, in a predominantly semi-arid region has had several repercussions. There is the loss of land-race seeds as the cultivation of commercial/cash crops displaces the cultivation of local crops. Linked to the use of increased amounts of fertilisers and pesticides there is the depletion of soil fertility and the increase in crop susceptibility to pests and diseases. As a whole, there is a lack of fit between the ecological specificity of the region and commercial agricultural practices. Climatic changes, especially changes in the rainfall pattern since the past two years (1997-98), compound the conditions of uncertainty and risk in agriculture, subjecting agriculture to an ecological crisis.

Economic crisis: Though commercial agriculture is promoted on the basis of utilisation of external inputs, institutional credit facilities to purchase these inputs are available only to a limited number of agriculturists (mostly large landowners).

Most agriculturists incur heavy debts in order to engage in commercial agriculture. Small and marginal cultivators for whom institutional credit is not readily or easily available resort to non-institutional debts at heavy interest rates in order to take to modern cultivation or to remain in cultivation. In times of ecological crises, such as an outbreak of pests or diseases, agriculturists incur more debts (from private creditors and from agri-business agents) to purchase pesticides. As crops are lost, due to both deficit and unseasonal rains and the outbreak of pests, several agriculturists are left with large debts, the repayment of which is beyond the immediate ability of many. As an increasingly commercial activity, agriculture increases the vulnerability of small and marginal agriculturists and provides no safety net (either locally or from the government) during periods of crises.

Social crisis: The introduction of commercial agriculture in a predominantly dry agriculture belt has its impact on the social fabric of the region. Commercial agriculture itself forces agriculturists to submit to the prescriptions of the agricultural extension service, the market, the agri-business agencies and credit institutions and agents. Agriculture no longer draws on the established principles of local knowledge and caste and kin-based ties. Instead, agriculture is a form of livelihood, to engage in which individual agriculturists depend primarily on their household and family support. As agriculture becomes an externally prescribed form of economic activity there are problems in the dissemination of knowledge, in the conduct of actual agricultural activities and in the understanding and management of situations such as crop loss.

The denouement of such conditions that can be identified as triple crises in the region necessitates that we raise several questions. What factors (economic, political, social and cultural) have combined to produce such conditions? What roles have the key agencies and agents of the government/state, the market/capital, and community played in this context? Who

is responsible for the utter degradation of life conditions in this region? Who have been the victims and who have gained?

Some answers to these questions may lie in understanding the general background of the region, the altered agricultural patterns and the socio-economic trends in the region.

II State Presence and Absence

In geo-physical terms Bidar district is part of the semi-arid and drought-prone belt of northern Karnataka and has been susceptible to periodic droughts. Though some 82 per cent of the total land is cultivated, only 8 per cent of its total cultivable area is irrigated and the state's efforts to provide irrigation have been lackadaisical. The two major irrigation projects, Karanja started in 1963 and Chulkinala started in 1972, are yet to be completed. Only 2,097 hectares are irrigated by canals and tanks, while the rest, of about 30,892 hectares, are irrigated by wells and tube wells. The state of incompleteness and disrepair (of the little that has been completed) of the two large irrigation projects are telling comments on the extent of state support for the region.³

Compounding the lack of development of infrastructure in the region is the de-industrialisation that has set in since independence and reorganisation of states. Though once a home to many cottage industries, such as cotton and oil-ginning mills [GOK 1977], there are now few industries that draw on local raw materials or skills. Even the well known form of local handicrafts, 'bidri' ware, is in a state of decline. Increasing prices of materials, especially silver, and declining sales have meant that many of the hereditary artisans are no longer employed in the production of such ware. Literacy levels are also below the state level and currently only 45 per cent of the total population are literate [GOK 1996-97].

A drought-prone district with little or no irrigation facilities and no alternative economic opportunities, Bidar has remained

in a state of continual poverty and mass deprivation. State assessments indicate that since the 1960s there has been little or no change in its conditions of 'backwardness' measured by indices of literacy, economic development, productivity, infrastructure, etc. In 1961, the district ranked the second lowest in terms of development and by 1969 it was ranked the lowest in the state [GOK 1977]. That the conditions of 'backwardness' in economic and social criteria persist is evident in the fact that in 1971 the district was assessed to be the 'least developed district' in the state [GOK 1977:305]. This continues to the present where Bidar with its average annual income of Rs 4,242 (for 1992-93 prices) ranks 19th out of 21 districts in the state in terms of per capita income [NABARD 1996].

Agricultural interventions: Agriculture in Bidar had its own specific form. Drawing on the specificities of the local ecology, agriculture was mostly dry cultivation or rain-dependent cultivation in which a wide variety of local sorghum⁴ ('jola', the staple grain) was grown in combination with pulses, oilseeds, wheat and other cereals. Though cultivation was restricted to two periods ('rabi' or winter cultivation from August to January, and 'kharif' or summer cultivation from June to September), care was taken to cultivate green manure crops of 'Sannhemp' and 'Diancha'.⁵ The cultivation and use of such manure crops helped agriculturists retain the fertility of the soil, decreased the chances of external pests and diseases entering the fields, and enabled agriculturists to be self-reliant for a very significant agricultural input. Even by 1970s little commercial or inorganic manure or fertilisers were used [GOK 1977].

But the agriculture of Bidar, like that of many other semi-arid regions which produced dry cereals, was considered to be 'low productive' and has been subjected to a variety of 'development programmes' that have drawn, largely, on the agenda of the green revolution. Drawing on programmes and policies that emphasise the need to increase agricultural productivity, the state has promoted a model of agriculture in the region that draws primarily on the model of agriculture developed for wet regions and for commercial cultivation.

In 1966-67, high-yielding varieties of seeds for sorghum, paddy, wheat and sugarcane were introduced [GOK 1977:150]. Gradually, between the late 1960s and mid-1970s hybrid varieties of seeds for other crops such as cotton, pulses and sunflower were introduced. Between 1972-74 the region was subject to a prolonged drought and scarcity conditions. Government intervention in the immediate

period saw to the provisioning of relief to people and cattle. But, after the end of the drought and scarcity conditions the district became part of a scheme to promote pulse cultivation.

The cultivation of 'tur' or 'toghri' (red gram) as a commercial crop became the primary agricultural agenda in the region. A significant proportion of land once under multi-crop and dry cultivation (especially sorghum, wheat and oilseeds) has now been dedicated to the cultivation of pulses, especially that of 'kadle' (Bengal gram), and tur (Table 1).

But, despite inadequate infrastructure and mass poverty, the region has been able to increase its production of tur. This is observable in the fact that yield rates of pulses were the highest in Bidar district (711 kgs/hectare) compared to the state average of only 477 kgs per hectare [GOK 1995-96]. As a result, since 1996 Gulbarga and Bidar districts account for 75 per cent of tur cultivation in the state.

The introduction and promotion of modern agriculture resulted in the development of two key and striking contradictions in the region. Perhaps, the most significant contradiction is that while there is an alteration in the very foundation and orientation of agricultural cultivation (in the type of crops cultivated, in the new seed varieties, new inputs, etc), there is little or no change in the social bases of the agrarian society. That is, though there is an alteration in the physical conduct of agriculture (in the types of crops grown, the cultivation patterns, etc), it is not matched by any alteration in the ownership patterns of the agrarian society in which new agriculture is introduced. Though largely a dry cultivation belt with a predominance of small cultivators, there is a schism in the patterns of land ownership. An overview of land-ownership patterns in the district will highlight this.

Currently, only 17 per cent of the district's agriculturists can be considered to be large landowners with holding sizes of between four and 10 hectares (Table 2). Thirty-six per cent of agriculturists are marginal cultivators with holdings that range from 2-4 hectares. About 45 per cent are small cultivators who own lands that range from 1-2 hectares.⁶ While the absence of very large holdings by a smaller proportion of persons is to be seen as an

advantage (only about 2 per cent of the holdings are more than 10 hectares), it is important to note that data indicates a continual fragmentation of landholdings. In 1971, the single largest category of landholdings was that of between 5-10 hectares and the average size of land holding was 6.2 hectares [GOK 1977]. But, currently (1996 data), the average size of holding is only 2.8 hectares [NABARD 1996] and a majority of cultivators are those who own less than two hectares of land. While such units cannot be assessed to be uneconomic in terms of mere size,⁷ the operators of such units face other problems.

Given the declining size of landholdings, many small and marginal cultivators resort to renting or sharecropping. Sharecropping in the region is known as 'lavani' and there are about four different kinds of lavani arrangements that prevail in the region.⁸ Insecurity of land lease, increasing production costs, inadequate returns from production, and problems in accessing and receiving credit are some of the problems that most small and marginal cultivators and lavani-holders face. Though such arrangements are not conducive to economic development, the state has not actively sought to provide security of tenure to these sharecroppers. This is evident in the fact that though tenancy is legally abolished (*vide* Karnataka Land Reform Act 1974), there have been no attempts to actually prevent sharecropping or to ensure transfer of titles to sharecroppers.

Of the poorer sections of the rural community it is only the labouring class, mostly the landless and low-ranked caste groups and members of scheduled castes, that has, only recently, seen a slight improvement in life conditions. Linked to the fact that commercial agriculture, without high and extensive mechanisation, increases labour demands (especially for

weeding, harvesting) real wages have increased [GOK 1997-98]. In addition, there has been some amount of collective political mobilisation and organisation among them as organisations such as the Dalit Sangharsh Samiti have been active in the region. Many of the labouring classes are now aware of the stipulated minimum wages, of their rights to receive ration cards and the rations with it and of other benefits that accrue to them.

Within this context, of relatively little or no change in the economic opportunities and social structures of resource allocation, the promotion of a model of agriculture that is largely dependent on external inputs and the market has implications for the life conditions of the cultivators. Agriculturists trade low-risk, low productive agriculture (typical of agriculture in dry regions) for a high productivity but also high-risk form of agriculture. Yet, such an engagement with agriculture places cultivators in a position of vulnerability, in which neither the agency that promotes this form of agriculture (the state) nor the sources (the market forces) that drive it support them in their time of distress.

III

Market and Agrarian Community

In addition to the role of the state in initiating changes and retaining certain social features in the region, it is important to delineate and understand the role of capital and the market in influencing the conditions of the people in the region. Though modern agriculture requires inputs (seeds, fertilisers, pesticides, technology, etc), much of the capital needed to purchase these inputs is not easily available to a majority of people. As the NABARD report for Bidar (1997-98) indicates, only large landowners are considered to be creditworthy and most institutional credit caters to their requirements. Most small and marginal cultivators, especially sharecroppers, are considered to be 'creditunworthy' and are bypassed by institutional credit agencies [NABARD 1997-98].

Two factors are accountable for such conditions. One is the general lack of credit made available to rural and agricultural credit institutions. From 1987 to 1992, the RBI has reduced credit availability to agricultural sectors from 19.1 per cent to 11.7 per cent [Rawal and Swaminathan 1998]. As a result there is a credit crunch in the agricultural credit institutions which typically meet 67 per cent of short-term loans and 37 per cent of long-term loans in rural areas. This combines with the fact that there are sharp fluctuations in agricultural production and

loan recovery rates are poor. As the NABARD report for Bidar (1997-98) details, loan recovery rates in the district are poor, standing between only 24 per cent for co-operative banks and between 27 and 30 per cent for commercial banks. Low recovery rates further discourage the entry of additional credit into the region and lead to the marking of most small and marginal cultivators as being creditunworthy.

A striking result of the lack of credit availability to small and marginal cultivators, when modern agricultural methods demand commercial inputs is that there is a mushrooming of non-institutional credit sources. Most of these non-institutional creditors are located in the towns of the district and in the villages. While a survey of the actual types and backgrounds of moneylenders in the region was difficult to conduct,⁹ the presence and impact of two new sources of credit were evident.

The first of these are the groups of families that have either benefited from commercial agriculture and or families with members who are employed in the urban sectors. Members of older, established landowning families, who have with the support of access to land, capital and technical advice reaped benefits from commercial agriculture, seek to utilise their surplus capital as usury. While money-lending by these households and family has always been part of the rural economy, it has now taken an impetus with the additional flow of funds that many of these households have. Urban remittances and surplus capital are ploughed into local moneylending outfits, which, with the government stipulation to be registered, call themselves 'financial corporations'. The presence and impact of these financial corporations is visible in the fact that in even small villages there are shops and houses that have boards indicating that they are 'financial corporations'. For instance, in the village of Murambi which has only 240 households there are nine financial corporations with members drawn from different caste groups. Lending rates in these agencies are between 40 and 50 per cent per annum (as compared to the average of 17 to 23 per cent at most institutional credit agencies). Most cultivators who are unable to procure loans from co-operatives or banks depend on these agencies for agricultural and non-agricultural monetary requirements.

The second source of credit in the region is that of the agri-input agencies themselves.¹⁰ Agents for large and small scale agri-input manufacturing industries not only sell fertilisers, pesticides, seeds, equipment and other agricultural requirements but also double as creditors by linking sales of these inputs with credit.

Manufacturers permit high interest rates by printing high maximum retail price (MRPs) on the items to be sold. It is left to the discretion and skill of the agent/distributor to sell the goods and retrieve the loans from the people. The availability of agri-inputs on credit acts as an incentive for most people to purchase these items.

In addition to the binding of cultivators through agri-input sales and credit, many agents also act as grain procurers. Having purchased inputs on credit, cultivators are often forced to sell their produce to these agencies, at prices that are below market rates, in order to clear their debts. While cultivators, as buyers and clients, are forced to submit to the dictates of the market they do not have the same leverage as sellers of their produce. Sharp fluctuations in prices, as observed in the decline in prices for 'tur' in 1998, increased costs of production without assured and commensurate procurement prices are trends that mark the economic life of cultivators.

In the establishment and entrenchment of such agencies in the region there is little or no state regulation or supervision. Though pesticide dealers and agents are required to have licences and be registered, many agents and distributors in the villages are not licensed. Cultivators speak of the large-scale dilution of pesticides and the lack of guarantee of many commercial seed varieties.¹¹ Sales of spurious seeds and pesticides remain an allegation which the state has yet to verify.

Compounding such problems, linked to the inputs required for commercial agriculture, is also the problem of knowledge or agricultural know-how dissemination. Though the practice of commercial agriculture is promoted formally by the government through its agencies such as the department of agriculture and the agriculture extension service and is largely backed by the promotion of commercial inputs by the agri-business agencies themselves, there are problems in the dissemination of knowledge. Though all village panchayats of the district are assigned a gram sevaka or agricultural assistant, contact between the agricultural assistants and the cultivators is not always assured. Most agricultural assistants maintain contacts and good rapport with only large landowners, sharing with them information about new seeds, pesticides, fertilisers and indicating ways in which to use the new inputs. In addition to this limited contact and supervision, much of the instructions for the use of agri-inputs (such as fertilisers, pesticides and seeds) are only in English and in some cases in Hindi. While a large proportion of cultivators are illiterate, even those literate in the regional and local

languages, in this case Kannada and Urdu respectively, are unable to comprehend the instructions and directions for the use of these inputs.

This limited contact between agricultural agents and small and marginal cultivators has its effect on agricultural conditions. Agricultural practices also alter within the context of informal dissemination of knowledge and imitation. Cultivators integrate new methods and new inputs through observing others and with little or no formal instruction in the details of using the new inputs. This haphazard dissemination of agricultural knowledge and practices lends itself to problems in the context of crises situations. This was evident in the discussion relating to the use of pesticides at the time of the outbreak of the heliothisis epidemic. Members of the agricultural extension service observe that cultivators did not spray their fields at the appropriate time (when the pests were in the larvae stage) and then resorted to rampant and excessive spraying when the pests had reached the fourth stage of maturation and were not susceptible to control by pesticides. However, cultivators indicate the absence of agricultural extension personnel in the field and the lack of instruction on how to handle a situation such as the outbreak of the heliothisis pest. The resulting gap in knowledge dissemination meant that cultivators not only lost a sizeable proportion of crops but also incurred large sums of debt. Such a situation calls attention to the problem of knowledge dissemination. While local knowledge and locally appropriate practices are being displaced, the spread of a new form of agriculture is not based on ensuring the proper dissemination and practice of new knowledge. Rather, cultivators receive and disseminate knowledge of the new practices and inputs in a rather ad hoc manner leading to confusion and even stress during periods of crises.

The result of such economic, ecological and social changes and their devastating impact on the local community was evident in the situation that developed in the agricultural seasons of 1997-98.

IV Season of Distress

The agricultural season of 1997-98 (between the months of June 1997 and July 1998) illustrates the conditions that prevail in the region. According to the taluka agricultural office, Bhalki, in the summer cultivation period, rainfall was 843 mm while the average expected is 890 mm. As a result there was a substantial decline in production. However, the winter cultivation season saw excess rains,

about 153 mm when the average expected rainfall for the period is only 19 mm. The climatic conditions of long periods of cloud cover and moisture provided the right conditions for an outbreak of pests. The standing crops, predominantly that of tur, were attacked by heliothisis, also called helioverpa. According to the assistant director, taluka agricultural office, Bhalki, heliothisis is a pest that reproduces three generations in a one-year cycle and which is difficult to control. In attempting to bring the pests under control and to salvage the remaining crops, cultivators resorted to purchasing (mostly on credit) pesticides and rampantly and frequently spraying their fields. Yet, by the end of the season, February 1998, almost 80 per cent of the tur crops were destroyed (Table 3).

The loss of crops for two successive seasons have been devastating for a region that is already poor. Not only were crops meant for commercial sale lost, but the production and storage of the local staple crop, sorghum or 'jola' from the region was eroded. Having taken to the cultivation of pulses on a large scale, there was a significant decline in the cultivation of cereals, including that of sorghum. Declining area under cereal production met with two years of rainfall fluctuations and sharp decreases of crop production. The result meant that by August 1998, when we visited the area, local sorghum was not available. Many people were resorting to purchasing sorghum from stores, which did not suit their palates and which, as many people indicated, was rotten. As a result, many of the local people had stopped consuming sorghum and had switched to consuming wheat rotis. While this loss of staple food, with its attending cultural significance, is a telling comment on the food security of the region, it was

the indebtedness of the marginal and small cultivators that triggered the sense of distress. Not only were a majority of cultivators in deep indebtedness but also the lack of local and external support compounded their distress. It was in this context that in some households the main earning members or heads of households, many who had incurred large debts, resorted to suicide. Table 4 gives a profile of the villages visited.

Based on a compilation of data made available by various reports, Table 5 provides an overview of the economic conditions of those persons who committed suicide. Even a cursory glance at the table on details of those who committed suicide will indicate that many were lavani holders with fairly substantial debts. The debts were primarily to private financial/lending agencies which implies not only higher interest rates but also more social and cultural pressure on these debtors. The weather fluctuations of the past two years (1996-98), and the resulting crop loss, have increased the indebtedness of cultivators. Many who borrowed did so not only for production purposes, but also to subsist. The non-availability of non-agricultural employment and institutional credit compounded the economic hardships of many.

While there may be slight variations in the case history of each person who committed suicide and his/her household and family situation, their situation is representative of the larger and more pervading despair and despondency that has set in among the agriculturists in the district. A description of one of the villages, Siddheshwara, which we visited, will provide a scenario of the region and the life conditions of the people there.

Siddheshwara – a temple-based village of about 600 households with a population

TABLE 3: ESTIMATED CROP LOSS IN SOME IMPORTANT CROPS

of approximately 4,000 people – is perhaps quite typical of villages in the district. Its clutter of thatch, stone and mortar houses are linked by narrow by-lanes, which now with the onset of the monsoon run with water, sewage, excreta and cow-dung. The temple of Siddheshwara looms large over the village and the new Basava statue, installed by the members of the local Rashtriya Basava Dal¹² marks the entry of the village and the temple. Despondency seems to be the ruling tone; poor climate, failed crops, an inefficient local government, an indifferent state apparatus. The men list their problems – the rains are unpredictable, for the past two years the winter or rabi rains have arrived at the time of harvest. Unseasonal rains have destroyed crops and the outbreak of pests has increased. The pesticides are ineffective, though vast quantities of pesticides are bought and sprayed. The pests and crop diseases have claimed the fields. Government compensation for crop loss is both inadequate and inefficient. How can a person who has lost several thousand rupees per hectare be compensated with a few hundred rupees? Worse still, the amount that is offered as compensation and the process to procure it is an insult. The government has disbursed cheques for sums so paltry that it does not even cover the cost of the bus charge required to encash the cheques at the district or taluka headquarters. Credit is hard to obtain – most people take loans from local creditors. For close to two years now there is little or no income. With increased costs of cultivation, many cultivators have incurred large debts and are unable to repay them. What are the alternatives?"

Under such conditions of changing agricultural practices, minimal state and administrative support, increasing subordination to market forces, high risks in agriculture and declining community support, it is not hard to imagine the personal distress that cultivators experience. In an agrarian community, with a long history of drought-related crop loss and scarcity, it is not just the loss of crops that has created tensions. Rather, it is the experience of crop loss in a context of significantly altered form of agriculture and community relations that accounts for distress among people. As the new form of agriculture links cultivators to the larger economy and market, it compounds the schisms within the local community. Commercial agriculture with its emphasis on increased commercial inputs and capital means the conduct of agriculture on individual and household bases. Moving away from agricultural patterns that were more or less similar across households (in

terms of type of crops, patterns of cultivation, knowledge base, etc), agriculture is now primarily an independent, household or family enterprise with more links between each cultivator and the market than among cultivators themselves. Successful cultivators, primarily those with larger landholdings and with access to capital, are able to withdraw into their own enclaves. As a result, such class variations in agricultural practices also mean variations in the degree and type of crop production or crop loss, which itself is experienced on a separate household/family basis. It is this, the loss of the collective¹³ and locally-bound characteristic of agriculture with the increasing subordination of agriculture to market, capital, and external know-how that leads to its practice new forms of distress. Crop loss now is not uniformly experienced by all cultivators, and for those who are subject to it, in addition to the attending effects of impoverishment, there is the stigma and loss of honour that result from being indebted and penurious.

The case of Shivaraj Mainalle of Siddheshwara village illustrates this. He was a man of about 40 years with five children, the oldest of whom was in the sixth standard. He owned about 2.32 acres and was a sharecropper or lavani holder for another six acres or so. For the past two years he had lost all crops, due to a combination of weather fluctuations and the outbreak of pests. His debts had mounted; by the end of 1997 he owed about Rs 24,000 to the local co-operative bank and some Rs 80,000 to private moneylenders. He is reported to have spent at least Rs 20,000 on pesticides alone. In this period of distress, his creditor, reportedly, asked him to return his money. Shivaraj Mainalle committed suicide in December 1997.

The most popular brand of pesticide sold in the region is endosulphan report-

edly banned in most western countries [Raithu Sahaya Committee 1998]. Its advertisement jingle, 'friend of friends, enemy of enemies' can provide the epigram with which one can contextualise the impact of agri-business and commercial agriculture in the region. In the context of the devastation that has been wrought on the people, it is pertinent to ask, who have been the friends and who the enemies of cultivators in this region?

Concluding Remarks

Distress in rural India is often recognised only at the end of periods of prolonged suffering, when hunger, loss of production and destitution become either publicised or politicised events. Government machinery is largely geared towards addressing scarcity situations, linked primarily to providing relief based on indicators of distress. Food, fodder and water scarcity are considered to be reliable indicators of distress. Even conditions such as these require political will for the administration to intervene. But conditions such as in Bidar do not fall into the bureaucratic categories for assistance.

Similarly, the understanding of distress in the region has been limited. Newspaper reports have, largely, seen it as individual cases of suicide.¹⁴ Some have questioned the claims of families to be compensated, others have assumed reports of such suicides to be opportunistic cases in which families sought to represent suicides from personal reasons as suicides from crop loss to receive government compensation. A few reports and analyses have actually linked agricultural conditions in the region to the policies of the state [Kamath 1998] and the subordination of cultivators to the market. The largely de-contextualised and piecemeal approach adopted in the cov-

@ Considered to have died of snake-bite

+ Considered to have died of excessive alcohol consumption.

erage of suicides in these regions is representative of the wide chasm between the lives of rural, agrarian residents and the urban orientation of most reporters.

The joint legislative enquiry committee, set up by the government of Karnataka, has submitted its report [GOK 1998], which finds that most cases of suicides are linked to crop loss and indebtedness. In recognition of such crop loss the report recommends monetary compensation to be paid to those families whose members have, as a result of experiencing crop loss and faced with high indebtedness, committed suicide. The report does not focus on the larger factors, especially those of widespread usury in the region, problems with the promotion of commercial agriculture, poor infrastructure development of the region, etc., which have combined to produce such conditions and in which suicides have been the most glaring result.

More recently, there have been calls from certain sectors of the government to send psychiatrists to the region. Resorting to psychological arguments is to deny the social and economic basis of such distress. More specifically, psychological arguments help deflect attention from the deep-rooted problems in the content, orientation, implementation and impact of economic policies. By remaining oblivious to the conditions of pervasive poverty, deprivation and collective disablement of the people, the state is laying the ground for a repeat of such distress. The state must recognise that it has been the key promoter of such an agricultural model in the region and thereby bears an onus in alleviating the risks associated with such a type of agriculture.

Distress in Bidar, of which the recent spate of suicides are only symptomatic, has resulted from a combination of crises: ecological, economic and social. Agricultural policies that overlook the ecological specificity of the region and the retention of inequitable social structures form the bedrock in producing such distress. The subordination of cultivators to market and capital forces without any safety net to support them in times of crop loss accounts for the devastation of rural communities. Just as the suicides are symptoms of the pervasive distress in the region, the loss of staple foodgrains in the region must also be considered to be a serious issue. As Susan George (1985) says, the loss of staple grains in any specific region without a substantial alternative economic base indicates a threat to the food security and hence the fragility of local communities. Any intervention must seek to address these factors and not attempt to provide temporary relief such as nominal monetary compensation. It would only

be fair to recognise that the victims of agrarian distress in the district are not only those who have committed suicide and their family members but also those who continue to live there, believing, as do most cultivators, that they have an obligation to the land, to the community, to the state and to the nation to continue to cultivate the land.

Notes

- 1 Fieldwork for this study was conducted between August 22-30, 1998. P. K. Shetty of NIAS was also a member of the team and has focused on the ecological dimensions of the issue (see his report, NIAS R6-99 for details). Due to the sensitivity of the issues we did not interview many of the families in which there had been suicides. All these families had already been subject to scrutiny by the press, local and state administrators and enquiry committee members. Details of the villages visited are available in Table 4.
- 2 In writing this report I have drawn on my field and research experiences in Bijapur district, which in many ways is similar to that of Bidar. Details of my research on Bijapur are available Vasavi (1999).
- 3 All data compiled from District Statistical Outline 1996-97, Karnataka Government, District Gazetteer, Karnataka Government, and NABARD (1996).
- 4 In our interviews with agriculturists in three villages we gathered that more than 30 types of sorghum had been grown in the district. Some of the varieties that they listed were Kemp Jola, Sherkhande, Dudimangare, Sakrejola, Kanmichike, Jingari, Haladi, Maldandi, Mussoli, Billi Jola, etc.
- 5 Sannhemp is called pundi and is a versatile green bush/shrub the leaves of which make for a nutritious vegetable and the dried stems make good rope.
- 6 All data compiled from District Statistical Handbook (1995-96) and NABARD (1996).
- 7 Economic anthropology has, typically, disputed neo-classical economic arguments that consider size to be a key factor in productivity. In terms of assessing agricultural productivity in relation to size they have argued and indicated the extent to which small parcels of landholding are utilised to maximum capacity and are thereby considered to be economically viable units.
- 8 The four types of *lavani* are: (1) a sharecropper pays a certain amount to the landowner and retains all crops and produce from the fields, (2) a sharecropper incurs all production expenses and gives half the produce to the landowner; (3) the owner and sharecropper share all the production costs and then share the produce; harvest, and (4) the sharecropper incurs all the expenses and gives one-third of the total produce to the landowner.
- 9 I approached the district's office of the registrar of co-operatives and moneylenders for data. However, they were reluctant and refused to share the data immediately. My request to have the necessary data (in terms of number of financial corporations, moneylenders, etc., for a period of ten years) mailed has been ignored.
- 10 Clive Bell (1993) documents the presence and impact of the new agricultural traders in the credit market of rural India. He however,

contests government claimers that there has been a decline in the number of professional moneylenders. He links the integration of agricultural trading activities by moneylenders as camouflaging their presence.

- 11 Despite widespread opinions that many of the commercial seeds and pesticides are spurious, there has been no measure to either verify this or to bring to the public's notice those companies or brands which are unreliable for production.
- 12 The Rashtriya Basava Dal is an organisation of Lingayats that seeks to regain the religious and social heritage of 'virashaivism'. In the region it is the most visible and dominant caste-based organisation and is responsible for the mobilisation of many youth into its wings and has become the model for other castes to organise themselves. Other caste and religion based organisations in the region are the Dalit Sangharsh Samiti, the Gondeshwara Sangha of the kurubas or the shepherds and the Tairik Muslim Sabha.
- 13 In characterising local, pre-commercial, agriculture as 'collective' I do not connote equity in terms of resource and production of all cultivators. Rather, the collective dimension of pre-commercial agriculture is to be noted in the similarity of production type, pattern, orientation, risk, and productivity levels among all cultivating units.
- 14 For example, some newspaper reports that seem to question the authenticity of these suicides as linked to crop loss are those in the *Deccan Herald*, June 6, 1998 and *The Times of India*, March 14, 1998.

Searching for Hindu Nationalism in Modern Indian History

Analysis of Some Early Ideological Developments

John Zavos

By tracing the ideological developments of the Hindu Sabha movement in the first decade of the 20th century in north-west India, this paper argues that development of Hindu nationalism as an ideology needs to be identified autonomous of Hindu communalism which emerged in the 1920s as a historical condition channelling ideological forces of Hindu nationalism towards particular objectives. Moreover, the Morley-Minto reforms of 1909, which aimed to restore faith in the representativeness of the colonial state and thus with over the moderates within the Congress, also instituted representative politics in terms of Hindu and Muslim identities. It was this legitimacy given to religious identities which, the paper argues, spawned Hindu nationalism as reflected in the Hindu Sabhas in Punjab, who, as against the Congress extremists' call for boycott of representative politics, argued for Hindu unity so as to enforce greater representation of Hindus in legislative bodies.

I Introduction

THE concept of Hindu nationalism has a significance and meaning which has been ferociously contested in modern Indian politics. Its exponents often present it as the 'real' or 'true' form of Indian nationalism, to be contrasted with western-inspired, universalist concepts of 'pseudo-secularist' nationalists.¹ Opponents, on the other hand, present it as the very antithesis of 'real' or 'true' nationalism. That is, if it is acknowledged as meaningful at all. Some academics have denied its existence altogether, arguing that right-wing Hindu political organisations have successfully "appropriat(ed) the uncontested terrain of nationalism" in order to characterise a political ideology which is manifestly anti-national.² This line of argument states that only communalism – the mutual antagonism of different communities – can adequately describe the projections of religious (or quasi-religious) identity which have come increasingly to dominate the political landscape in India. Hindu communalism, the argument goes, is the most institutionalised and the most powerful form of this identity; it is therefore the greatest threat to the Indian state, and to the very idea of the Indian nation. To characterise such a concept as nationalism, then, does indeed appear paradoxical.

So what, then, if anything, is signified by the concept of Hindu nationalism? Exponents appear to equate it with Indian nationalism, whilst rejecting the universalist nationalism of so-called pseudo-secularists; opponents equate it with communalism, the antithesis of (universalist) nationalism. The theoretical position of Hindu nationalism, then, appears to be

persistently compromised by the operation of two key concepts: Indian nationalism and communalism. As Sumit Sarkar has recently pointed out, these two concepts have established a critical dialectic in modern Indian politics. It is a dialectic which configures much of the debate over the nature of politics and the particular significance (or otherwise) of concepts such as Hindu nationalism.³ The dialectic has a history which is now fairly well-established in modern Indian historiography, locating the 1920s as the significant period of development. During this decade, communalism, or more specifically the communal riot, emerged as a systematic feature of political life in northern India.⁴ This emergence was mirrored by the self-conscious articulation by Jawaharlal Nehru and others in the Indian National Congress of what has been termed 'pure' nationalism, "unsullied, in theory, by the 'primordial' pulls of caste, religious community, etc".⁵ A kind of framework of polarisation, then, was established between Indian nationalism and communalism, in which the latter is presented as specifically anti-national, a set of ideologies ranged precisely against the emerging hegemony of the Indian nation.⁶

In this paper, I will focus on the development of Hindu nationalist identity in a period prior to the 1920s. That is to say, I will focus on a period prior to the critical period in the development of this dialectic between Indian nationalism and communalism. My objective is to examine the way in which Hindu nationalism developed autonomously; without, as it were, the pressure of the dialectic to configure its meaning. I will concentrate on the ideological development of the Hindu Sabha movement, which emerged in the first

decade of the 20th century in north-west India. This movement undoubtedly represents an attempt to propagate a nationalism based on the idea of Hindu identity. What will be demonstrated is that this form of identity nevertheless developed very much within the context of rapid change and intense scrutiny of another form of identity, that of elite-led Indian nationalism. The paper argues that the development of these competing nationalisms was intimately related: they operated on the same discursive terrain of middle class consciousness, and they addressed the same central question of how 'the people' should be represented in relation to the state.

Two points, then, must be established at this stage. First, any analysis of Hindu nationalism needs to take account of a specific history of polarity between two key concepts: Indian nationalism and communalism. This study takes appropriate account of this context, in the sense that the period covered self-consciously pre-dates the critical phase in the development of this framework of polarisation. Secondly, my analysis posits a close relationship between Hindu nationalism and Indian nationalism during this period, seemingly in direct contravention of this history of polarity. The focus, however, is on Hindu nationalism, not Hindu communalism. This conceptual distinction is central to the argument here. It is also, I would say, central to an understanding of how Hindu nationalism operates in Indian politics. Initially, then, I must examine this distinction, and suggest a theoretical model for the separation of the two concepts. In our immediate context, this will also allow for a clearer understanding of ideological dynamics in the pre-1920s period.

II Hindu Nationalism and Hindu Communalism

In political analysis, Hindu nationalism is very often equated with Hindu communalism. Hindu nationalism is perceived as a form of contemporary communalism – another way, as it were, of saying Hindu communalism.⁷ It may be a case of terminological slippage, but this implicit association with communalism underpins the polar opposition of Hindu nationalism to Indian nationalism, and reiterates the question of whether there is a conceptual distinction to be made between Hindu nationalism and Hindu communalism.

A key position to clarify in relation to these issues is the comparative status of the conceptual terms being used. Peter van der Veer has argued that communalism and nationalism are radical and moderate tendencies within the same ideology of nationalism. 'The moderates' he says, "accept cultural pluralism and equality among different religious communities within the nation, while the radicals see the nation as the community of co-religionists". It is all part of the same conception of nationalism, which for van der Veer is based on pre-colonial notions of religious community.⁸ Here, then, the idea of Hindu nationalism as communalism is accommodated as a feature of a linear scale of moderate to radical nationalism. The two come together in the idea that communalism is "only a form of nationalism (in which) a common religion...is imagined as the basis of group identity". This form of nationalism is then placed at the other (radical) end of the scale from pluralist (moderate) nationalism. For van der Veer, then, nationalism and communalism can be seen as comparable sociological concepts. They occupy different points, but they are on the same scale. Despite its intention to break free of the problem of polarity, this model continues to articulate what is implicit in forms of analysis which identify the oppositional character of nationalism and communalism: namely, that these are 'twin' concepts, which can be compared like to like.

This comparability needs to be questioned. In his examination of communalism as a 'form of colonialist knowledge', Gyanendra Pandey has recognised a significant flexibility in the term communalism.⁹ It is not, he says, a term specific to religiously-configured communities. It has rather been applied to any form of community that displays an antagonistic stance towards another community, within a colonial or post-colonial context – religious, yes, but also linguistic and caste based

communities. This antagonism, it must be noted, is always directed primarily towards communities based on the same kind of signifier as their own. The other of the communalist, then, is a kind of conceptual echo: a linguistic communalist will direct his hostility towards another linguistic group; a religious communalist towards another religion, and so on. Achin Vanaik has argued that this kind of flexibility leads to a loss of focus, not to say rigour, in the term – it becomes too broad to be useful.¹⁰ Rather than making the term too broad, however, my argument is that this flexibility strips the concept down to the level of a framework, narrowing rather than broadening its possibilities. Communalism emerges as a fairly stark and simple structure. It is defined first and foremost by an antagonism towards what is other than itself, and that other is principally some form of conceptual echo of itself. In this sense, the structure of the concept does not replicate the complex, multi-layered form of nationalism, and so cannot be seen as comparable. It is little more than this antagonistic alignment against its conceptual echo. Because of this simplicity, communalism does not necessarily generate its own ideology; it is more likely, in fact, to appropriate existing ideologies to extend its form, deepen its impact.

This, I would say, is precisely the relationship between Hindu communalism and Hindu nationalism. The latter provides the ideological tools for the development and extension of the former. Let me make the distinction clear: (1) Hindu nationalism is defined as an ideology that seeks to imagine or construct a community (i.e., a nation) on the basis of a common culture – a culture configured by a particular notion of Hinduism. This ideology, I would further suggest, was developed largely by middle class Indians, over a period coterminous with the development of elite-led Indian nationalist ideology; (2) Hindu communalism is a kind of discursive framework that aligns the interests – social, cultural, political, economic – of this imagined or constructed community precisely against the interests of other religious communities, particularly, of course, the Indian Muslims.

The distinction, then, is between the kind of concepts we are dealing with. Communalism and nationalism are not immediately comparable as concepts, because communalism is more a historical condition than an ideology – it emerges as a method of channelling ideological forces towards particular objectives within the context of modern 'disenchantment'.¹¹ This distinction allows for the exploration

of an ideological development in the 19th and early 20th century – that of Hindu nationalism – which is less teleologically burdened. As we have already noted, the 1920s constitute the point at which communalism is crystallised as a systematic feature of Indian politics, and the critical dialectic between Indian nationalism and communalism begins to emerge. What I am saying is that this crystallisation does *not* constitute the culmination of a process of ideological development. It rather must be perceived as a process driven by the interplay of several historical factors, some of them ideological, but also others that were structural, 'event-led', and even external to indigenous politics. The ideology of Hindu nationalism was of course a major factor in the process of communalisation, but its development as *an* ideology needs to be divorced from the process, as it had, and still has, its own existence separate from the structure of communalism.

III Hindu Nationalism and Indian Nationalism

If, then, we can think of Hindu nationalism as autonomous of communalism, we have to consider the issue of what kind of ideology it was. Evidence from the late 19th and early 20th century demonstrates that it was, as I have mentioned, a middle class ideology.¹² This raises questions about how it developed, what it represented, and what distinguished it from the very middle class ideology of elite-led Indian nationalism?

These questions have been addressed in recent studies by the political scientist Christophe Jaffrelot.¹³ Jaffrelot recognises the emergence of Hindu nationalism as a distinct political ideology around the turn of the century in north and north-west India. The development of this ideology constituted the first stage of what he calls the 'birthing process' of Hindu nationalism. The second stage, located in the 1920s, saw the emergence of Hindu nationalism as a form of political mobilisation that drew on identity symbols provided by this ideology.¹⁴ This would appear to be a similar model to that suggested in the previous section, in that Jaffrelot recognises the existence of an apparently autonomous ideology that informs the mobilisation of the 1920s. But Jaffrelot further theorises his model, by placing it within the framework of ethnic nationalism. It is this ethnicity, he says, that distinguishes Hindu nationalism from the universalism of Indian nationalist ideology, with its projection of "all individuals, all communities living within British India" as the nation.

The framework of ethnicity obliges Jaffrelot to situate Hindu nationalism in relation to its attendant tensions: most notably, the tension between primordialist and instrumentalist approaches to the development of ethnic movements. As a form of identity, Jaffrelot states that Hindu nationalism was not primordialist, drawing on an established sense of ethnicity; yet at the same time, it was not instrumentalist, a cynical construction of the elite, because it does re-interpret themes drawn from the established tradition of Hinduism. Jaffrelot rather suggests the ideological construction of Hindu nationalism as a cultural strategy to defend brahmanical hegemony. This strategy was pursued by certain socio-religious reform organisations, particularly the Arya Samaj.¹⁵ As it moves into its second stage of political mobilisation, however, it is more straightforwardly interpreted as an instrumentalist movement driven by what he calls 'ideologically minded Hindu elites'.

To my mind, this projection of Hindu nationalist ideology as somehow structurally different because of its ethnic or cultural conception of the nation is problematic. First, it leaves little room for the development of the culture of Indian nationalism – the latter is presented as a rather flat political nationalism that can have no influence over the development of an exclusivist, combative Hindu sense of ethnicity. This belies the increasing sophistication of Indian nationalism towards the end of the 19th century, and leads Jaffrelot to describe the extremist strategy of the Congress nationalists Tilak and Aurobindo as a product of their 'Hindu leanings'.¹⁶ This kind of extremism, interestingly, is reminiscent of van der Veer's moderate-to-radical scale of nationalism. Secondly, Jaffrelot's emphasis on Hindu nationalism as a strategy designed to defend brahmanic hegemony is particularly problematic in the context of the Arya Samaj, as in its early years around the turn of the century this organisation faced fierce resistance from precisely those groups – the established hierarchies of Hinduism – whose interests it is presented as protecting.¹⁷

But most significantly, although Jaffrelot presents Hindu nationalism as a distinct ideology in the late 19th and early 20th century, he nevertheless states that it was not 'codified' until the early 1920s. By this he means that it was not until this period that the ideology was consciously articulated, largely through the written work of V D Savarkar.¹⁸ This codification constitutes the 'second stage' of the birth of Hindu nationalism, and although it is perceived as different, in that it represents

a straightforward instrumentalist project of the elite, it is not perceived as a conceptual difference. Communalism emerges again as a kind of 'extreme' form of Hindu nationalism, manipulated by certain 'ideologically minded Hindu elites'. It is the instrumentalism of these elites, furthermore, which is key to the development of this construct of Hindu nationalism as communalism. In this context, the autonomous significance of the earlier form of the ideology as a cultural strategy – neither primordialist nor instrumentalist – begins to fade. It is teleologically bound to the elite-driven project of 1920s communalism. Here, the notion of ethnic nationalism locates its 'natural' situation, as an ideology which underpins a violent and reactionary political force. We are back, as it were, where we started: with the polarisation of (universalist) nationalism, and (ethnic) communalism, and the subsequent problem of how to conceptualise and distinguish Hindu nationalism as an ideology outside this dialectic.

The distinction between ethnic and universalist nationalism in this context could refer us to Partha Chatterjee's critique of theories of nationalism, which demonstrates an orientalist imperative behind the identification of two 'types' of nationalism in this way.¹⁹ Jaffrelot's notion of ethnic nationalism is also significant, however, because it draws on a particular conception of ideology, developed by the anthropologist Clifford Geertz. Geertz perceives ideology as what he calls 'schematic images of social order' – symbols or metaphors – consciously constructed as a means of rationalising change in a modernising society.²⁰ Ideology, then, fulfils a specific function in this context; a function associated with the defence and modulation of social and cultural norms.²¹ Despite his assertion that "the function of ideology is to make an autonomous politics possible", Geertz is curiously reticent in defining its relationship to class – a point acknowledged by Jaffrelot²² – and also to colonialism, even though much of his work draws on the ethnology of post-colonial south-east Asia. What emerges from this approach is a restricted notion of ideology. It is perceived as a facet of culture, a re-interpretation appropriated as a means of establishing and defending that culture in the face of rapid change. In addition, the significance of issues of class, colonialism and indeed caste in this context are ringfenced by the conscious instrumentalism of particular social groups.

An alternative approach would be to refer to the wider conception of ideology developed by Gramsci, and the extension of his work, particularly in relation to

culture, by Stuart Hall. Here, ideology can be resituated in a far more strategic relation to culture itself. Ideology, Hall states, constitutes the 'mental frameworks' –

the languages, the concepts, categories, imagery of thought, and the systems of representation – which different classes and social groups deploy in order to make sense of, define, figure out and render intelligible the way society works.²³

The fundamental position that ideology assumes here in relation to people's perception of the world means that far from being an aspect of culture, ideology is a means through which culture is defined. What is perceived as culture is dependent upon the dominance of particular ideologies. Using this model, in conjunction with the idea of communalism as a structure, rather than an autonomous ideology in itself, the development of the ideologies of Hindu nationalism and Indian nationalism as middle class ideologies in the pre-1920s period is less problematic. They remain distinct, but are not burdened by the historical necessity of implacable opposition. Indeed, the evidence of the 19th and early 20th century suggests that the two ideologies developed in the same discursive space, competing precisely on this level of 'mental frameworks'. This is evident, for example, in the work of V D Savarkar, Swami Shradhdhanand, Lajpat Rai: all three of these 'architects' of Hindu nationalism had been in prison because of their activities as Indian nationalists, and all were perceived as – and perceived themselves as – genuine Indian nationalists during the 1920s. By employing Geertz' perception of ideology as limited, it may be possible to present this apparent paradox as symptomatic of figures who were Hindu nationalists in cultural terms and Indian nationalists in political terms. My argument suggests that examples of almost simultaneous expression of the competing ideologies simply reflects the struggle for dominance of these 'mental frameworks' on the discursive terrain of middle class Indian public life. The proximity of these ideologies meant that they blended and clashed frequently in both cultural and political contexts.

This close relationship is evident particularly when shifts occurred in the common discursive field. Middle class Indian nationalism, grounded even in the 1880s in a very rigorous economic critique of colonialism, was most instrumental in providing a coherent challenge to the colonial state on a hegemonic level.²⁴ A significant consequence of – and vehicle for – this challenge was a progressive questioning of the boundaries of middle class political discourse, by which I mean

political discourse recognised as legitimate by the state. The first decade of the 20th century was a particularly dynamic period in this process. During this decade, the established discourse of Indian nationalism in the Congress organisation was challenged by what became known as 'extremism'. In the following sections, I will argue that the emergence of the Hindu Sabha movement towards the end of this decade must be viewed in the context of this discursive challenge. The representation of the community of Hindus, an idea which underpinned the Sabha movement from the outset, was related directly to struggles within Congress over how precisely the Indian nation was to be represented. It is this notion of representation, indeed, which dominated the politics of this period, and, in a sense, provided the space for the articulation of the community of Hindus.

IV

The Battlefield of Representation: Extremists, Moderates and Strategies of Confrontation

The 1905-08 campaign against the partition of Bengal is indicative of emerging trends of considerable significance in the Indian national movement. First, it forced the diversity of views in the Congress into two oppositional 'parties': moderate and extremist. Secondly, it marked the development of strategies of confrontation which worked specifically to expose the perceived (economic) contradiction between the interests of the state and the putative Indian nation.

The extremist strategy of boycott and swadeshi as employed during the anti-partition campaign was based primarily upon an economic resistance to colonialism. The central locus of the movement was the boycott of Lancashire cloth (and other British goods) and the parallel encouragement of indigenous industries. The boycott was extended from this base into a more sophisticated network of boycotts (a "doctrine of passive resistance" as it was called by the Bengali extremist Aurobindo Ghose), encompassing education, justice and administration. The central economic focus was employed despite the fact that partition was not primarily an economic issue. Boycott was rather a strategic response. As the Maharashtrian extremist B G Tilak commented in 1905, "people will not persevere in the swadeshi movement, unless they burn with indignation at Manchester – robbing the country of so much wealth".²⁶ As this indicates, the emphasis of the movement was on expanding political comprehension of colo-

onial economic relations. This theme of comprehension underpinned the whole strategy. Tilak again states, in relation to the administrative boycott, that "it may not be feasible to boycott government service altogether, but that is no reason why we should not try to impress upon the minds of the people that government service exercises a debasing influence upon character".²⁶ The literal success of the boycott was not the issue here. Its principal objective was rather to increase popular consciousness of – to "impress upon the minds of the people" – the damaging implications of British rule.

The objective of this strategy, then, was ideological. It sought to transform the 'mental frameworks' which middle class nationalists like Tilak and Aurobindo saw as holding key social classes in thrall to the enduring image of the colonial imperative. In this sense, boycott and swadeshi may be defined as a strategy of counter-hegemony, configured precisely to undermine the idea that the state worked primarily in the interests of the Indian people. Consequently, the organisational structures that they sought to employ were directed not towards government, seeking redress, but towards the people, seeking the tangible expansion of the constituency of Indian nationalists.

This was undoubtedly a shift of discursive focus, but in practice the only potential organisation through which to implement such an expansion was the Congress. This organisation was controlled by the moderate 'party', which continued to articulate politics through established discursive structures. Here, the idea of representation was legitimised through the invocation of parliamentary or democratic idioms, whilst at the same time eschewing any mechanism to link representation to particular constituencies. The representational claims of moderates, therefore, were symbolic. Their claim was that the Congress was a symbol of the nation, and their authority was based on the recognition of this symbol in colonial politics. The pressure which the divergent approach of extremism exerted on this dominant idea of symbolic representation led in 1907 to a split in the Congress. In effect this split expelled the extremist strategy from the organisation, and re-asserted the significance of symbolic representation in the national movement.

Nevertheless, the parameters of debate, the possibilities of elite nationalism, had developed significantly. The state had to confront the growing counter-hegemonic potential of the strategy of boycott and swadeshi. It did so by attempting to marginalise extremism and actively ac-

commodate moderatism, through the strategic offer of constitutional reform. Reform was an indication of political progress, signalling a further affirmation of moderate methods. Why turn to new forms of articulating nationalism, the state in effect declared to the middle classes, when the old forms have reaped reward.

For the moderate Congress, this was a critical affirmation of its strategy. As G K Gokhale commented to the secretary of state, John Morley, in 1908, without reforms "the extremists will have their own way; confusion, danger, ruin will follow".²⁷ Because of this pressure, the actual content of the reforms was of less significance to the moderates than the concept, the image, of reform taking place. This is reflected in the Act which eventually emerged in 1909 (known as the Morley-Minto reforms) after four years of deliberation.²⁸ Other than the formal recognition of separate Muslim interests, it appears that the Act had no substantial transformational effects on the structure of Indian government.²⁹

It was, in this sense, a symbol of constitutional progress, which was appropriately linked to the moderate strategy of symbolic representation. An example of this pervasive symbolic approach is provided by the debate over the retention of the Seditious Meetings Act in the newly constituted Imperial Legislative Council in 1911. In planning to soften this oppressive act in deference to Gokhale and other elected members of the council, the Viceroy Lord Hardinge commented that

We must be careful not to reduce the Act to an absolute nullity. Still, *some impression would be made* if the amendments to the Act were moved and accepted in open Council, so that the non-officials might get the credit for having effected something, and the government might *appear to have made some concession to opinions* in the Council (emphasis added).³⁰

The image of the process, then, was central. In this sense, the reforms of 1909 represent an attempt to reiterate the principle of symbolic representation as a meaningful framework for the expression of political aspirations, in the context of the emergence of a counter-hegemonic discourse in middle class nationalism.

As noted above, one significant feature of the reform package was the institution of exclusive Muslim colleges in the electorate for provincial legislative councils. This explicitly affirmed the recognition of a Muslim community, and in doing so it also implicitly affirmed the recognition of a Hindu community. In what sense, though, were these communities recognised. The colonial state had, of course, long perceived

religion as the defining principle of Indian identity, Indian history and culture. Morley and Minto certainly invoked this perception in their presentation of the reforms.³¹ In our context, however, the influence of symbolism is also evident here. The Muslim and Hindu communities that the Act called up were the symbolic constituencies of incipient political organisations, in the same way that the Indian nation had been the symbolic constituency of Congress nationalism in its moderate form. The government's invocation of these constituencies gave powerful impetus to attempts to articulate the politics of identity on this level. But it was the implicit debate over the nature of representation in Indian politics which underpinned these developments.

The Hindu Sabha: Defining the Structure of Hindu Politics

The Hindu Sabha movement developed in this context as an attempt to represent the interests of a putative Hindu constituency. The movement emerged in the volatile political atmosphere of Punjab during the first decade of the 20th century. From 1906 a series of Hindu Sahaik Sabhas were established which consisted of "the cream of the Arya, Brahmo, Theosophist, Sikh, Sanatanist Societies...".³² The principal aim of these Sabhas was to "protect the interests of the Hindus by stimulating in them the feelings of self-respect, self-help and mutual co-operation so that by a combined effort there would be some chance of promoting the moral, intellectual, social and material welfare of the individuals of which the nation is composed." The common theme was collaboration: inaugural meetings were attended by the 'heads of all sections' coming together to "work with co-operation on a single platform".³³ The idea, then, was to create a conglomeration of organisations which together would form a spectrum of religious affiliation. As long as the spectrum presented a coherent image, it could claim to "represent the interests of the Hindu community". The community of Hindus is created by binding together in one organisation a series of existing organisations which purported to represent the various components of this larger community. This image, then, replicates the idea of symbolic representation noted in the previous section as underpinning moderate strategy, and as central to the established structure of political discourse. This point is supported by the fact that the kind of organisations involved were almost exclusively middle class: the

Tribune's list above confirms this doubly, by emphasising the elitism of those involved ("the cream of the Arya, Brahmo, Theosophist..." etc).

In the context of the Congress split in 1907, and the constitutional reforms of 1909, the movement gathered pace. Work was focused on the reform package, and on the Punjab Alienation of Land Act of 1901, which was perceived as particularly discriminating against the urban-based Hindu middle class.³⁴ As well as addressing communications to both the provincial and central governments on these issues during 1909,³⁵ the Sabha made its presence felt by voicing concern over the reform package to the viceroy in person, as part of a welcome address during a short visit to Lahore in April. The address was reported to have "touched the viceroy to the quick and led His Excellency to remark that the questions raised in it did not suit the occasion".³⁶ This incident was widely commented on in the press, and the Sabha consolidated the resulting heightened profile by preparing for a Provincial Hindu Conference in Lahore in October 1909, as a demonstration of the unity of Hindus in Punjab.

A prime mover in these preparations for the conference was Lala Lal Chand, the first prominent leader of the fully established Sabha movement. Lal Chand was a well known Arya Samajist of the College branch. He was also a judge in Lahore and one of the founders of the Punjab National Bank.³⁷ Beginning in February 1909, he published a series of articles in the *Punjabee* under the title 'Self-Abnegation in Politics', which have since gained stature as a foundation text of the Sabha movement.³⁸ The somewhat obscure title refers to the attitude of Hindus towards politics, which Chand perceived as self-denying, always allowing the claims of other forces in society to take precedence. The concession of separate Muslim electorates in the Morley-Minto reforms is presented as the apotheosis of the tendency.

Blame for this loss of self-assertion is laid fairly and squarely at the door of the Congress, an organisation that "makes the Hindu forget that he is a Hindu and tends to swamp his communal individuality (sic) into an Indian ideal, thus making him break with all his past traditions and past glory".³⁹ The Congress ideal of a composite nationhood, he continues, "was not only erroneous to start with, but...has become impossible under the declared hostile attitude of the other community". The only way forward, then, was "to start anew on a fresh basis, abandoning, if not pulling down, the fabric which

instead of giving political shelter and refuge has exposed the (Hindu) community to winds and hailstorms from every quarter".⁴⁰

Lal Chand's agenda was explicitly political. His articles reiterate again and again the point that "the object is not to discuss the general amelioration of the Hindu community in its various aspects", but rather "the political aspect of the Hindu community under its present environments" (emphasis in original).⁴¹ As such, he largely sidesteps the issue of identity, of what precisely constitutes the Hindu community which he is addressing. Beyond the invocation of fairly widely understood notions of Hindu history, and an attempt at defining patriotism in terms of community as opposed to territory,⁴² Lal Chand does not appear to be overly concerned with issues of culture, religion or ethnicity. He nevertheless asserts the need for consolidation, but it is a political consolidation – one might even say a symbolic consolidation:

Weak and disunited we are and divided into various sects. But the remedy lies in bringing the sections on a common political platform where they would realise that they are merely branches of the same stock and community, and not lead them further astray and to teach them as if no such community exists or has a political status.⁴³

The structure of the Hindu Sabha, then, with its spectrum of religious organisations, is legitimised here. The existence of the constituency – the Hindu community – is ensured by the presentation of a united front of these 'various sects' in the Sabha organisation. The unified Sabha, then, becomes a powerful symbol of the consolidated community.

This inclination towards the value of symbolic representation is reiterated in Chand's response to the Morley-Minto reforms. This needs to be seen not only in terms of the recognition of separate Muslim interests, but also in terms of the increasing impotence of Congress moderatism, and the related ideological struggle to assert counter-hegemony as the strategic focus of Indian nationalism. Lal Chand rejects the latter in no uncertain terms. His understanding of politics is "in the sense of relations between the governed and the governors"; he does not therefore endorse politics based on the "uprooting of these relations".⁴⁴ "It is mere tall talk", he continues, "to speak of self-growth and self-development" when the community is so weak. Because of this it is of "paramount importance to reconcile, and not to make needlessly antagonistic, the powers that be".⁴⁵ Later he refers to the split in Congress at Surat in 1907 as

a result of the clash of these opposing strategies towards the state:

Self-help [i.e. swadeshi and the rejection of state-centred politics] ...threatened at one time to cause a split in the Congress camp and not improbably did cause the split. The advocates of the theory [i.e. extremists] would discredit their opponents [moderates] by calling them mendicants. Their scheme was to make no appeals to government nor send any memorials, but to achieve political ascendancy without government help. The theory is attractive in form as it appeals to self-pride but I, at any rate, am at a loss to understand how resolutions passed at meetings will redress the grievances unless it is intended – whether so addressed in form or not – that these should reach government and induce it to take measures for redress.⁴⁶

The politics of extremism, then, do not fall within the purview of this prominent judge of Lahore.

The moderate Congress, however, had also patently failed to deliver any tangible political gain. "When the time came for rewarding the labours a little, the substantial portion of the reward was assigned to the other community."⁴⁷ The problem, however, lay not in the structure of Congress politics – i.e. the "appeal to the authorities...to address the wrong" – but rather in the projection of the Congress constituency (through, of course, symbolic representation) as a united nation. When Lal Chand talks of starting anew, of pulling down the fabric of contemporary politics, he is referring largely to the substitution of this constituency with a Hindu constituency. In this context, the appropriation of the existing political discourse – with symbolic representation at its heart – and the existing structure of politics – based on the recognition of quasi-representative bodies by the state – is the logical means of representing the putative constituency of Hindus. Thus Lal Chand, at the very end of his series of letters, proposes:

the substitution of Hindu Sabhas for Congress Committees, of a Hindu press for the Congress press, organisation of a Hindu Defence Fund with regular offices and machinery for collecting information and seeking redress by self-help, self-ameliorations and petitions and memorials supplemented by agitation in the press and advocacy through trusted leaders in matters both special and common but dominated primarily by regard for Hindu interests.⁴⁸

It is possible that Lal Chand's approach in *Self Abnegation* was influenced by the government's crack-down on Arya Samaj's involvement in politics following the Punjab disturbances of 1907.⁴⁹

Certainly he places great emphasis on his objection to the Congress demand for self government within the Commonwealth as an "impracticable demand and a pure source of irritation", and is keen at other points to emphasise his loyalty.⁵⁰ It is in any case perhaps not surprising that such a prominent subject of the British Indian state should be anything other than an advocate of strictly legitimate politics.

What is interesting, however, is that this dry and somewhat unwieldy series of articles should emerge as what Jaffrelot calls the 'ideological charter of the Hindu Sabha'.⁵¹ As Hindu politics emerged, it became fused to the idea of symbolic representation, a method of structuring politics which neatly avoided the thorny question of who precisely was being represented. Conforming precisely to the state's own idea of how a political organisation should operate (not only in the sense of symbolic representation, indeed, but also of course in the sense that the projected constituency was – in some sense at least – religious), Lal Chand's vision of the Hindu Sabha intended to call the constituency of Hindus into being simply through the power of political articulation in the context of discursive change.

Self Abnegation set the pattern for the first Hindu Conference, which was held in October 1909 in Lahore. Prior to the conference, the Arya daily the *Punjabee* began collecting comments from the national press which indicated that the Sabha movement "has made its infant existence, albeit devoid of any achievements, felt".⁵² For example, it quoted admiringly from the *Reis and Rayyat*,⁵³ which had suggested a (admittedly somewhat vague) definition of the parameters of Hindu unity in anticipation of the conference: "the Hindus scattered all over the Indian peninsula are divided into various forms. But there is the bedrock of uniformity in the belief in the Vedas and some other essential dogmas."⁵⁴ A few days later, an approving article in the *Bengalee* was extensively quoted. This article compares the unity of the Sabha movement to the fractious state of Congress nationalism: "While the echoes of the Congress controversy continue to reach our ears, the great Hindu community of the Punjab are silently maturing their plans and are slowly but steadily moving forward towards the formation of a great Hindu federation." The *Bengalee* also had a suggestion for the defining principle of unification in this federation: "Race, and not religion, ought to be the guiding principle of the organisation. For the Hindu is the most tolerant of human beings and the Hindu faith the most comprehensive that one can think

of, embracing within its fold the believers in cults and creeds of the widest divergence."⁵⁵

This idea of tolerant 'unity in diversity', based on a range of unifying principles, was the overriding theme of pre-conference comment. A confirmation of this unity, it appeared, was the most significant, the most sought after objective that the conference could aspire to. As the *Punjabee*'s special conference issue commented, "This is the first time, we believe, in the history of modern India, that the Hindus as a body have sought to give expression to their communal consciousness, as distinguished from the detached movement of sects and castes."⁵⁶

Lal Chand's address to the conference as chair of the reception committee reflects this central concern. He began by commenting that "numbers carry great weight in this age and help materially in deciding the fate of any struggle. The progress of a community is now as much measured by its numerical strength as by its moral and economic achievements."⁵⁷ He then went on to urge the point made in *Self Abnegation*, that for Hindus defining this community was simply a question of articulating it on the level of colonial politics. Although he did refer to the "needless corrosive differences" of sub-caste in his critique of contemporary Hindu society, as any good Arya of the time would, his solution was based firmly in the realm of symbolic representation. "All that is needed", he says, "is to advocate the interests of the community at large and the moment we realise this germinal idea, this sacred obligation, ...all self-imposed differences and schisms will vanish away like chaff". As soon as Hinduism is presented as united politically, then, social divisiveness will disappear. The image of a politically-organised Hinduism assumes the status of principal objective in Chand's vision of the Sabha movement.

The importance of this objective is evident in the resolutions that emerged from the conference. Not surprisingly, consensual issues were prominent: the promotion of Sanskrit and Hindi, support for cow protection and ayurvedic medicine, the promotion of 'brotherly feelings' among Hindus and a commitment "to consolidate and strengthen the sense of common nationality". These were accompanied by more hard-nosed resolutions regarding the Punjab Alienation of Land Act and representation in legislative councils, which reflected the new political presence indicated by *Self Abnegation*. Several resolutions, however, were not put before the Conference, ostensibly through lack of time. These included

reformist issues such as support for widows, low caste amelioration and the removal of sub-caste distinctions.⁵⁸ The idea that these resolutions were dropped not due to lack of time but due to "strife apprehended over them between the orthodox and the unorthodox" was denied at length after the conference,⁵⁹ but undoubtedly the need for consensus was a prominent factor, and the *Punjabee* rounded off its denial of the above with a reminder that the main objective was "union as opposed to division".

One of the resolutions which was approved was that calling for the establishment of Hindu Sabhas "all over the country", and to hold an annual all-India Hindu Conference. In 1911 the first Hindu Sabha was established in United Provinces, and by 1915 enough momentum had been generated to establish the All India Hindu Sabha as a representative body for local and provincial Sabhas. It is this body which was to become fully active in the early 1920s as the Hindu Mahasabha.⁶⁰ Throughout this period the emphasis on the need for an image of "union as opposed to division", which had emerged in 1909 as closely linked to the discursive implications of symbolic representation, remained central. By the 1920s, when the *sangathan*, or organisation, movement dominated the agenda of the Hindu Mahasabha, this notion of consolidation had developed into a defining principle of Hindu nationalism.

VI Conclusion

This historical review, then, places the development of the Hindu Sabha and its incipient Hindu nationalist ideology in context. It has been demonstrated that during the first decade of the 20th century, certain Indian nationalists became increasingly committed to ideological struggle as the central strategy of confrontation with the state. This strategy began to shift the parameters of political discourse which occupied both middle class nationalists and the state at this time. One important feature of this shift was that representation now emerged as a site of political struggle. The state claimed always to act in the best interests of the people as a whole. Nationalists sought to counter this claim by illustrating the inherent contradictoriness of British benevolence, claiming that nationalism, and not the state, represented the interests of the people.

This battlefield of representation was made more complex by the intra-nationalist struggle. Leaders like Tilak hoped to extend the representative quality of na-

tionalism by wresting its organisational machinery (principally the Congress) from the control of the moderates. Leaders like Gokhale remained convinced that the state was ultimately benevolent, and so needed to be approached on its own terms, employing the quasi-parliamentary idioms dictated by the established political discourse.

The state undoubtedly capitalised on this struggle, attempting to marginalise extremism by confirming the success of moderatism, through the offer of constitutional reform. In a fascinating reflection of the established discursive framework of colonial politics, the reform package which emerged in 1909 was largely insubstantial, characterised by the overriding need to promote the *image* of reform. As the moderates projected themselves symbolically as the representatives of the people, then, so the reforms to which they were committed constituted a symbolic shift in the balance of administrative power.

At the same time, the reforms provided a window of opportunity for the more forceful projection of a politically organised Hinduism. The incorporation of separate electorates implicitly invoked a constituency of Hindus within a discursive framework which confirmed symbolic representation as a legitimate form of political expression. The constituency of Hindus could be represented, simply by providing a united image within existing discursive parameters. It was precisely this image that the Sabha movement attempted to project. As Lal Chand asserted during the 1909 conference, to create a politically significant Hinduism "all that is needed is to advocate the interests of the community at large".

This was not, however, simply a reaction to the Morley-Minto reforms. Clearly, it was an idea with a history intimately linked to the development of moderatism, and to the emerging power and sophistication of counter-hegemonic nationalism. What is demonstrated here, then, is the close interrelation of Indian nationalism and Hindu nationalism on a discursive level, and the articulation of opposition (in our case Hindu nationalist opposition to the Indian nationalist Congress) precisely on this level. The Hindu Sabha self-consciously echoed the structure of moderate Indian nationalism even as it rejected the Congress organisation as a toothless and unrepresentative force. This proximity meant that there was always a tension in this opposition – it was not clear cut, and depended on the continuing struggle for dominance on the level of 'mental frameworks'. For this reason, there was often a blurred quality to the distinction between the two ideologies. But this was not. I

would contend, a quality derived from the laying over of political nationalism with cultural or ethnic nationalism. The pre-occupations of the Hindu Sabha demonstrate that even in its earliest forms Hindu nationalism operated as a political nationalism, articulating its identity on the basis of, and in response to shifts in, the established discourse of colonial politics. In the arena of symbolic representation, the space between the Indian nation and the Hindu nation was not an implacable divide, nor did it signify completely different ways of thinking about nationalism. Rather, it signified different interpretations of what was largely the same pool of ideas about history and culture. These interpretations were based on different concerns in relation to colonialism, but they were articulated in the same public space, and the image of the nation – Indian or Hindu – was produced in much the same way.

I have argued that this similarity is not problematic if an appropriate conceptual distinction is made between Hindu nationalism and communalism. Communalism is a historical condition, rather than an ideology in itself. Ideologies such as Hindu nationalism informed this condition, but nevertheless maintained an autonomous existence on the level of mental frameworks. The development of a structural dialectic in Indian politics between (religious) communalism and (secular) nationalism during and after the 1920s has, I would suggest, obscured this autonomous existence. The discursive proximity demonstrated here between Hindu nationalism and the ideology of Indian nationalism must be acknowledged independent of this structure of polarisation. Only then can the role of Hindu nationalism be fully addressed as a developing ideology in the modern history of Indian politics, enabling a more flexible analysis of its movement and influences in 'mainstream' political settings.

Notes

- 1 The Hindu nationalist leader M S Golwalkar, for example, expressed this contrast: "We say that our Hindu Nationhood is a truth, borne out by logic, experience and history. It is the supreme solid fact of our national life and not any fleeting 'ism' born out of political and economic theories or exigencies." See Golwalkar, *Bunch of Thoughts* (Vikram Prakashan, Bangalore, 1966), p 127.
- 2 See S Mahajan, 'Which Swaraj? Ram Raj or Hindu Raj: the Making of India's Post-Independent Polity' (unpublished seminar paper, University of Sussex, 1997), p 5.
- 3 See Sarkar, 'Indian Nationalism and the Politics of Hinduva' in D Ludden (ed), *Contexting the Nation: Religion, Community and the Politics of Democracy in India*, (University of Pennsylvania, 1996, pp 270-93), pp 270-71.

- 4 In 1931, a Congress enquiry listed a total of 43 major riots since 1921. See 'Congress Cawnpore Riots Enquiry Committee Report', reprinted in N G Barrier (ed), *Roots of Communal Politics*, (Heinemann, New Delhi, 1976), p. 228.
- 5 G Pandey, *The Construction of Communalism in Colonial North India*, (Oxford University Press, Delhi, 1990), p. 235. Pandey gives numerous examples of the articulation of this kind of nationalism in opposition to communalism see pp 235-43.
- 6 See, for example, Ayesha Jalal's key interpretative dialectics between centralism and regionalism, and nationalism and communalism, as employed in her *The Sole Spokesman: Jinnah, the Muslim League and the Demand for Pakistan*, (Cambridge University Press, Cambridge, 1985), and *Democracy and Authoritarianism in South Asia: A Comparative and Historical Perspective* (Cambridge University Press, Cambridge, 1995).
- 7 Achin Vanaik notes the pitfalls of this approach when he acknowledges in his *The Furies of Indian Communalism, Religion, Modernity and Secularisation* (Verso, London, 1997) that whereas in previous work he was willing "to adopt the term 'Hindu nationalist' as an adequate characterisation of Hindu communal forces", he now sees the latter as a "deeper and wider phenomenon" (see p 204, n 161). His careful distinctions nevertheless still allow for communalism as a kind of extreme form of Hindu nationalism, 'the most vicious form of it going in India'.
- 8 van der Veer, *Religious Nationalism: Hindus and Muslims in India* (University of California Press, Berkeley, 1994), p. 22-23.
- 9 See Pandey, *The Construction of Communalism* pp 6-7, whilst he does refer to Pandey's identification of communalism as an "orientalist term", produced as a form of orientalist knowledge van der Veer does not pursue the argument around flexibility.
- 10 See Vanaik, *The Furies of Indian Communalism*, p. 196.
- 11 As in Weber's process of disenchantment associated with the spread of modernity Richard G Fox has used this model to argue for communalism as a 'new enchanted identity' created by modernity – a process, as he calls it, of 'hyperenchantment'. See his 'Communalism and Modernity' in Ludden (ed), *Constructing the Nation*, pp 335-49, pp 237-38.
- 12 On the middle class character of this ideology, see J Zavos, *The Emergence of Hindu Nationalism in Colonial India* (Oxford University Press, Delhi, forthcoming 2000).
- 13 See Jaffrelot's book *The Hindu Nationalist Movement in India 1925 to the 1990s* (Viking Penguin India, New Delhi, 1996), see also his articles 'Hindu Nationalism: Strategic Syncretism in Ideology Building', *Economic and Political Weekly* (March 1993) Vol 20 Nos 12-13 pp 517-21, and 'The Genesis and Development of Hindu Nationalism in the Punjab from the Arya Samaj to the Hindu Sabha (1875-1910)', *Indo British Review* (1993) Vol 21 No 1, pp 3-39.
- 14 On this process, see particularly 'The Genesis and Development of Hindu Nationalism'.
- 15 *The Hindu Nationalist Movement in India*, p. 15. Hindu nationalism largely reflects the Brahminic view of the high caste reformers who shaped its ideology, see also 'The Genesis and Development of Hindu Nationalism' pp 3-7.
- 16 *The Hindu Nationalist Movement in India*, pp 17-18.

- 24 This argument is, I believe, valid regardless of the objective extent of hegemonic control exerted by the state; a good deal of work has demonstrated the limitations of this control in the Indian context, most notably Ranajit Guha in his 'Dominance without Hegemony and its Historiography' in R Guha (ed), *Subaltern Studies VI*, (Oxford University Press, Delhi, 1989), pp 210-3091. For a discussion of this and other work on this topic, see Zavos, *The Emergence of Hindu Nationalism in Colonial India*, chapter 1.
- 25 Kesan, September 25, 1905; *Report on the Native Press in Bombay Presidency* (National Archives of India), No 39 of 1905.
- 26 Kesan, February 19, 1907 *Report on the Native Press in Bombay Presidency*, No 8 of 1907.
- 27 As reported by Morley to the viceroy Lord Minto, December 4, 1908, quoted in S Wolpert, *Tilak and Gokhale: Revolution and Reform in the Making of Modern India* (University of California Press, Berkeley, 1962), p. 237.
- 28 On this question of image, it is interesting to note Morley's comment to Minto as early as June 1906: "Not one with more than you do I think it desirable or possible, or even conceivable, to adapt English political institutions to the natives who inhabit India." Nevertheless, he continues, "the spirit of English institutions is a different thing..." Quoted in Wolpert, *Tilak and Gokhale*, p. 186.
- 29 Minto admitted in 1909 that "in fact I always thought our proposals are very conservative in many ways and was surprised at the good reception they met with from Congress circles." Minto to Lansdowne, March 18, 1909, quoted in B R Nanda, *Gokhale: the Indian Moderates and the British Raj* (Oxford University Press, Delhi, 1977), p. 318. A few months before the bill was due to pass through Parliament, Morley wondered whether "we shall not be laughed out of court for producing a mouse from the labouring mountain." Morley to Minto August 6, 1908, quoted in Wolpert, *Tilak and Gokhale*, p. 237. For an overview of the content of the reforms, see S Sarkar, *Modern India 1885-1947* (Macmillan India, Delhi, 1983), pp 137-44.
- 30 Quoted in Nanda, *Gokhale*, p. 383 (emphasis added).
- 31 In presenting the reforms to the House of Lords in 1909, Morley stated that "Only let us not forget that the difference between Mahomedanism and Hinduism is not a mere difference of articles of religious faith. It is a difference in life, in tradition, in history, in all the social things as well as articles of belief that constitute a community..." Morley on Indian Councils Bill, February 23, 1909, in Philips, *The Evolution of India and Pakistan 1858-1947: Select Documents* (Oxford University Press, London, 1962), vol IV of *Select Documents on the History of India and Pakistan* – general editor, C H Philips), p. 86.

ENVIRONMENTAL ECONOMICS PROGRAMME

*(World Bank Aided India: Environmental Management
Capacity Building Technical Assistance Project)*

*Implementing Agency: Ministry of Environment and Forests, New Delhi
Executing Agency: Madras School of Economics, Chennai*

BASE LINE SURVEY: UPDATE

In December 1997, a base line survey on the status of teaching and research in Environmental Economics in universities, colleges and research institutions was conducted. 80 institutions responded to the survey. However, information on one or more of the following questions was not responded:

1. Name of the Institution with complete address.
2. List of faculty members who have done or planning to do teaching or research in the field of Environmental Economics.
3. Courses in Environmental Economics offered at under-graduate and post-graduate levels (existing as well as planned) along with copies of the syllabi.
4. List of Ph. D. and M. Phil dissertations in Environmental Economics completed or in progress.
5. Research Projects undertaken in the area of Environmental Economics with details relating to topic of research, project status, funding agency and publications.

The base line data has to be updated in order to meet the needs of the Capacity Building Programme in identification of institutions teaching courses in Environmental Economics for library support, Ph. D. scholars working in Environmental Economics for participation in the Ph. D. Scholars workshops, eligible faculty members for participation in the faculty training programmes and preparation of India – specific reading materials in Environmental Economics based on the research already completed. This information will be made available to the World Bank, the Ministry of Environment and Forests and other interested user agencies. The interested institutions are requested to provide information on the above five items on or before **September 11, 1999** to:

The Coordinator
Environmental Economics Programme
Madras School of Economics
Behind Govt. Data Centre
Gandhi Mandapam Road
Chennai 600 025.

Democracy and Cultural Particularisms

That liberal democracy is deliberating on the need to find universalistic principles for resolving particularistic cultural disputes is a demonstration of how the quest for enlarging citizenship in an activist fashion is an ongoing enterprise. Liberal democracy needs to be more concerned with people than with things, with survivors and not with survivals. A universalistic liberal democratic society should devise policies that help people from disprivileged cultures to survive and surge ahead. 2313

Emerging Economic Challenges

A review of the strategic policy failures which landed the Indian economy, till very recently, in a low-productivity, low-growth impasse and a discussion of the critical areas to focus on in the next phase of economic reforms. 2326

Two-Party Syndrome and India

Is India heading towards a two-party system? One way to test the two-party hypothesis is to speculate on the results of the forthcoming elections, on presidential discretion and on the formation of coalitions - all of which are notoriously unpredictable. Another way is laid on more solid ground: it poses the problem in a framework of comparative terms - actuality vis-a-vis thoughts, practice vis-a-vis theory, civil society vis-a-vis the state, and all those in turn across political parties. 2330

Indian Economy: Empirical Patterns and Regularities

Harmonisation of national accounts statistics, balance of payments accounts, monetary and banking data and data on the budgetary operations of the government of India makes it possible to identify many important empirical patterns and regularities, notably the existence of business cycles, the counter-cyclical nature of inflation, the twin deficits problem, the impact of absorption on reserves, the evolution of the debt-income ratio, the relationship between real interest rates and growth and the sustainability of the fiscal stance. 2345

'Augmenting' the Ganges

Contending that their lean season requirements are greater than the Ganges flow, India and Bangladesh have seen the solution in 'augmentation'. But in the case of a natural resource such as water, requirements are to be brought down to the level of availability, not the other way round. 2296

Common Threat

The common threat facing India's wildlife habitats and the livelihood interests of a majority of local communities comes from the rampant 'developmental' process which is encouraging the commercialisation of ecologically and culturally sensitive areas. 2305

Bengal Politics

The 1999 parliamentary elections may prove to be a turning point in West Bengal politics. The Congress is in no way a threat to the ruling CPI(M) any longer. Mamata Banerjee's Trinamul Congress is now the real opposition. However, Mamata Banerjee's emergence as the principal opposition force is also an ominous sign. 2298

Industrial Recovery

GDP is expected to grow by 6 per cent in 1999-2000, the same as last year, but a major qualitative change expected this year is the recovery in the manufacturing sector. The impetus to the recovery seems to have originated in increased availability of bank finance. 2286

Electricity Reform

The Karnataka Electricity Reform Ordinance does not deal with the basic tasks of improving the efficiency and transparency of operations of the state electricity board. It tinkers with form, not substance. 2300

Agriculture and Reforms

It is time that efficiency considerations prevailed in public spending in agriculture and market signals were allowed to come into full play so that changes in agricultural investment and production are demand-driven in response to domestic and international prices. 2293

ASEAN after Crisis

The question before ASEAN now is whether it should continue on its old course of non-interference or re-energise itself through open political and economic debate among member states. 2304

Good Neighbours

AS a former freedom fighter of 1942 vintage and septuagenarian pedant, who values academic and societal mores rather highly, I want to say that India may have won many a battle against Pakistan, but our country has lost a major war against extremes of national hatred, instant patriotism and derailment of amicable neighbourly relations. We, who participated really and effectively in the freedom movement had dreamt about free India fostering the cult and culture of good neighbourly relations between India and Pakistan. Our approach was cautious, since we believed that good fences make good neighbours and clear and well-defined borders could be demarcated between India and Pakistan.

But in India today, we search in vain for our cherished ideals of peaceful coexistence and beneficial mutual political and economic relations between India and Pakistan. Amidst the debris of our dreams, we find that the ruling class political parties and so-called Hindutva intoxicated knicker brigades are spreading the virus of jingoism and instant patriotism. In this political situation, we are ignoring the sane and sound voices of reason and a call for ending the war hysteria and those who plead for purposeful bilateral negotiations with Pakistan. Instead of brouhaha and braggadocio, what we need today is a national and human approach to needs and aspirations of the people of Kashmir. Also India should demonstrate its core managerial and diplomatic competence in tackling the Indo-Pak relations. Instead of focusing only on a show of firmness and heartlessly hard approach to the border issues, the Indian political ruling class

should adopt a more flexible policy of meaningful negotiations with Pakistan.

We freedom fighters wanted to do to India and Pakistan what a spring does to cherry blossoms. (Pablo Neruda's metaphor is a little changed here.) We then believed that there would emerge a viable framework for a co-operative confederation between India and Pakistan. There is still some hope if the masses and people's progressive movements in both the countries compel the ruling classes in India and Pakistan to seek people-friendly solutions to Kashmir and Indo-Pak problems. But it is still possible to do enough, to quote Dag Hammarskjöld. On independence day, let the people of India and Pakistan celebrate the glory and majesty of peace.

Adult Education

WHATEVER the views of the researcher (April 10-16) in regard to adult education, I strongly disagree with the author's assessment of total literacy campaign (TLC) in the light of my assessment of TLC in 11 districts of Tamil Nadu at the instance of the National Literacy Mission and the Madras Institute of Development Studies (MIDS), Chennai. While doing so I had the privilege of watching at close quarters the functioning of the campaign which was in various stages of operation, some in campaign phase, others in the project preparation stage, but all of them under the dynamic leadership of collectors who are now occupying very important and senior positions in the TN government and enthusiastic and committed volunteers ('tannarvathondarkal', i.e. self-motivated young volunteers). The article

has been uncharitable to the band of able district collectors like Sheila Sunkath and Busia Gandhi, at Pudukkottai and Muthuramalinga Thevar. The collectors did not appear to have any difficulty in shaking off their bureaucratic mantle. In fact they appear to have carried their zeal for development work to the secretariat where they are holding senior positions. To my mind this was possible because the district collectors had a band of enthusiastic young men who did not hold an official position in the hierarchy. They readily rose to any occasion and ensured that there was a proper image of the campaign. Also all the directly recruited district collectors had studied development economics and related areas in the course of their on-the-job training. Some wrote informative articles in learned journals and published books which I had the privilege to review. I say this also on the basis of the numerous discussions that our team had with groups of persons from different walks of life: municipalities, panchayats, MLAs and ordinary citizens. Indeed the campaign phase of TLC continued right up to the end of teaching and learning. There are numerous instances of wholehearted participation: In May when our team visited Tirunelveli at about noon a very large number of women under the shade of two or three trees were doing combined studies. We had gone unannounced and each one of them showed us what they had learnt.

But then in the end came the most disturbing question as to what use can this learning and literacy be put to unless there is some way of supplementing their meagre household income. Of course, the team was delighted to be told that the pawnbrokers can no longer dupe them. The question about earning income made us all uncomfortable because that was the real hitch, the failure to weave appropriate functionality adequately into the teaching-learning process in spite of the existence of several programmes at the grass roots level for improving the lot of the poor and illiterate. This was due to the failure of the development activities and departments meant for the upliftment of the poor to come anywhere near the learners. This was the most important failure of National Literacy Mission to which we drew attention resulting in a general circular to all. Indeed a golden opportunity for effective implementation of all development programmes at the grass roots level was lost due to the absence of a well-thought-out strategy to which the author has rightly referred.

Nurturing the Money Market

DEVELOPMENT of the money market in India has been one of the major goals of the Reserve Bank of India. For two reasons. One, because the shift from direct to indirect instruments of monetary policy, consequent on liberalisation and deregulation, has made a well-developed money market critical to the success of the central bank's open market operations. And two, because of the urgent need for a mechanism that provides reasonable access to suppliers and users of short-term funds to fulfil their borrowing and investment needs at an efficient market clearing price.

Over a period of time, therefore, the bank has taken a number of steps to widen and deepen the money market. Indeed the last monetary policy announcement of the bank focused extensively on reforms in this area. Following the announcement, there have been a number of firsts. In May the bank conducted the first-ever price auction of government securities. In a price-auction, as distinct from the earlier auctions where bids were made based on expected yields, bids are made in terms of the price which bidders are willing to pay for loans which have already been issued in the past. The biggest advantage of price auctions is that the re-issue of loans issued earlier results in the consolidation of outstanding loan balances. Consequently instead of having a large number of loans of different nomenclature, some with very little floating stock, it is possible to have a few loans with large floating stock needed for more efficient secondary market trading and consequently better price discovery. Soon after, the bank came out with a calendar of Treasury bill auctions, thereby greatly improving on the present system wherein sudden announcements of auctions take the markets by surprise and do not allow them to plan their strategy in advance. In early July, interest rate swaps and floating rate agreements (FRAs) were permitted, making it possible to shift from fixed to floating rates of interest and vice versa.

And now, in what is perhaps a harbinger of the most important development in the money market during the year, the bank-appointed committee on repos has recommended a series of wide-ranging changes in the present regime. The report follows close on the heels of the recent relaxation allowing 35 non-bank entities to enter the repo market, albeit in a limited way. If and when the bank accepts the committee's recommendations, it would be the first significant step towards dismantling the restrictions with which the bank had trussed up the repo market following the securities scam in 1992.

Repos, or repurchase transactions, are money market transactions where funds are mobilised by selling securities and agreeing to repurchase them at a predetermined date and rate. The difference between the sale and repurchase price is the interest or earning for the period. Repos straddle both the securities and the pure money market as they combine elements of both a securities purchase/sale operation and also a money market borrowing/lending operation and are critical to facilitating smooth adjustment of short-term liquidity among participants in the money market. A reverse repo is the mirror image of a repo. Here securities are bought with a simultaneous commitment to sell them back. Hence whether a transaction is a repo or a reverse repo is determined only in terms of who initiates the first leg of the transaction. As compared to pure call money and inter-corporate deposit markets where transactions are not backed by any security, the repo market is characterised by transactions which are fully backed by securities. Consequently, counterparty risks are minimised. It is for this reason that repos are among the most popular money market instruments in the more developed markets. In India too, repos had become exceedingly popular in the late 80s/early 90s.

However, in the panic that set in after the detection of widespread misuse of repos during the scam, the RBI had clamped down on the repo market. And though over the past few years there have been some relaxations from time to time, the plethora of restrictions had created a fragmented market with all its attendant inefficiencies. The prohibition on forward contracts under Section 16 of the Securities Contracts (Regulation) Act, 1956, also made matters difficult, because in terms of the government notification issued under this section of the act, read with the act's Section 28, only certain permitted institutions were exempted from this ban and that too only in certain specified securities. In fact the special court looking into the scam-related developments held that all repo transactions undertaken by banks and institutions were illegal and void as they were prohibited under the SCRA and the government notification of June 1969. The result was that the RBI became completely paranoid about allowing repos on a large scale and even after it partially revoked its knee-jerk reaction of banning repos outright, it so knotted up the market with regulations that repos all but died.

It is against this backdrop that the recommendations of the committee come as a breath of fresh air. The committee recognises that the first impediment to the development of a vibrant repo market is the GOI notification of June 1969

prohibiting forward transactions in securities. Accordingly it calls for a repeal of the notification as also of the existing Public Debt Act 1944, which does not recognise the existence of government securities in electronic form. With these legal impediments out of the way, the committee goes on to recommend a system of both 'over-the-counter' (OTC) and exchange traded repos. All entities who have both subsidiary general ledger (SGL) accounts and current accounts with the RBI will be allowed to undertake both repos as well as reverse repos in all government securities. For the moment, however, this will be permitted only in Mumbai. As far as other entities, including corporates, are concerned, they will be allowed to undertake repos and reverse repos in government securities, PSU bonds, private corporate debt securities and bonds issued by FIs provided these are held in demat form in a depository (so that the problems associated with physical transfer are eliminated) and transactions are routed through an approved stock exchange with a well capitalised clearing corporation as the legal counterparty. Essentially, therefore, all debt paper will be eligible provided it is in dematerialised form and certain other safeguards in terms of uniform accounting practices and daily marking to market are in place. The consequent spurt in the number of repos for varying maturities will effectively result in the emergence of a term structure of interest rates. This is critical to the growth not only of debt markets but also of hedging instruments.

While it is indisputable that the committee's recommendations are a quantum jump from the position as it exists today, where the committee seems to have erred in limiting 'over the counter' transactions to only those entities who have both SGL and current accounts with the RBI. It is an undisputed fact that setting up an exchange, a clearing corporation, etc, will take a very long time and will cost a lot of money. In the meanwhile, the needs of the very large and significant non-bank financial entities would not be met, defeating the very purpose of opening up the repo market. The RBI would, therefore, be well advised to consider allowing these entities to route their repo transactions through constituent SGL accounts with primary dealers. Even in the case of OTC deals, there is no reason why such transactions should be limited only to what can be routed through RBI, Mumbai. It is time the bank took steps to expedite its long-pending plans of computerising its functions and bringing about connectivity between its various offices so that transactions are not restricted only to Mumbai. Only then will the repo market come of age.

AFFIRMATIVE ACTION

Changing Context

THE Supreme Court pronouncement on reservation in super specialties, being hailed as a landmark judgment, is in fact nothing of that sort. It is a vivid indicator of both the limitations of institutions like the courts of law and the problems that affirmative action is likely to throw up in the course of the changes that its own impact on society brings about. A five-judge Constitution bench of the Supreme Court has ruled that the purpose of reservation was to ensure that reserved category candidates should not be denied the opportunity of benefiting from post-graduate medical courses and that they come up to such standards as were expected of medical graduates with such qualifications. While general category candidates did not suffer from any social disability, the special opportunity provided by reservations could not be made available to those who were substantially below the levels prescribed for the general category. Such candidates would not, the court has decided, be able to fully benefit from specialised training designed to produce "high calibre well-trained professionals for the benefit of the public". It struck down the UP and the Madhya Pradesh acts which had prescribed what the bench thought were unreasonably low qualifying grades for the reserved category.

Certainly, on first reading it does seem like a pragmatic decision. But it raises far more questions than it resolves. First, it assumes that reserved category students, suffering from social disadvantages and therefore unable to compete in the general category, will not be able to emerge as high calibre well-trained professionals. After all, these same students will have completed the first level of the professional medical course and will presumably be "rendering service to society" at that level. Is there an invisible barrier to their "fully benefiting" from the specialised training at the later stage? If poorer grades present a barrier to the pursuit of training, then it would be the same whether in the lower or higher levels of professional training. Surely, well-trained professionals are needed at all levels – as general practitioners, service engineers, accountants, nurses, etc. Are we to interpret the judgment to mean that unfit professionals may be tolerated at lower levels but not at higher ones?

The bench could have instead elaborated on a more logical line of reasoning: that it would be reasonable to assume that the social disadvantages that the reserved candidates suffered from would have been

somewhat mitigated by the time they arrived at the higher levels of professional training, hence making it unnecessary to artificially create a level playing field. That it has not sought to give an explanation along these lines partially indicates the court's dilemma. The purview of the court is after all to rule on the immediate matter of the validity of reservations. And while it can make predictions of outcomes, it does not deliberate upon the impact of affirmative action so far. It is in this sense caught in the same maze that the socio-political system is trapped in – while one way of mitigating social disability is by affirmative action, how is its impact to be monitored? When do we declare that a level playing field has been achieved? Has affirmative action become an excuse for the absence of social and developmental programmes which would make such 'reservations' unnecessary? Today with the socially deprived, the scheduled castes and tribes and the backward castes, accessing political power in an enduring way, partly because of the state's affirmative provisions but essentially because of transformations at the societal level, the issue of the legitimacy of reservations will come up more and more frequently. And as often as not, it will be the judicial system which will have to be deliberating on the matter. This is reason enough to seek some clarity on what kind of role the courts will play in the circumstances. For this institution is in the peculiar position of being able to initiate, and has in the past prompted societal reform; but equally it can become moribund and choose to be dictated by a limited, even technical perspective. Is the recent judgment indicative of a trend in the latter direction?

TRADE TALKS

Time to Get Serious

THE ministerial meeting of the G-15 countries in Bangalore next week is being dressed up to look like a major milestone in the supposed efforts of the developing countries, whom the G-15 is supposed to represent, to evolve a common approach to the industrial countries' push for a new round of multilateral trade negotiations, the so-called Millennium Round, which will come up for discussion at the meeting of the 134-member countries of the World Trade Organisation (WTO) in Seattle in November. It can confidently be predicted, however, that it will be nothing of the sort. There are many reasons for this, including above all that the quest for the will-o'-the-wisp of a common position of so large and diverse a group as the developing countries on fresh trade negotiations as a whole

(as distinct from possible commonality of interests among specific sub-groups of countries on particular issues forming part of such negotiations) was a futile exercise to start with. That this doomed objective has nevertheless been so ardently clasped to its bosom by the government of India reflects the partiality of the present leadership of the government's ministry of commerce for demagoguery, a typical example of which was the commerce secretary's claim last month, widely quoted in the press, that India had been, alas, misled into signing the WTO agreement.

The commerce minister and his officials have over the past many months sought to give the impression, without however saying so categorically, that the government they speak for is opposed to a fresh round of trade negotiations. In support of their position they have advanced arguments such as that there is a heavy overhang of commitments yet to be fulfilled arising out of the WTO agreement and that the developed countries have been dragging their feet on their existing trade liberalisation obligations. However, these arguments do not cut much ice. The WTO agreement specifies timetables for the fulfilment of different obligations by different groups of countries as well as provides for forums and procedures for action in respect of recalitrants. This is not to deny that there still remain very serious problems of market access all round, including for particular goods and services of the poorer countries including India. But to deal with them it is imperative that the international efforts to progressively liberalise trade are continued.

If by its political posturing, the commerce ministry was trying to test the waters of international support, among the developing countries in particular, it must have got all the answers it was seeking. The response to the Bangalore meeting of the G-15 must itself be reckoned to be a reliable straw poll: only eight of the 17 countries constituting the group have even bothered to send ministerial level delegations to the meeting. Clearly, unless the new government which takes office after the coming parliamentary election changes tack on international trade issues, there is a real danger of our fulminations against the WTO and the richer countries being seen as an attempt really to cover up the fact that India continues to be among the most protected markets among any group of countries, rich or poor.

Shorn of political hyperbole, there are a number of issues which call for serious consideration in the context of the Seattle conference and on which India should, and could, mobilise opinion among like-minded countries. Most important of these is the developed countries' attempt to link

trade liberalisation to international acceptance and enforcement of universal norms in regard to such matters as employment of child labour or labour and environmental standards. These demands, strenuously lobbied for by NGOs and labour unions in the rich countries as well as some of their older and less competitive industries, are little short of a campaign to shut out exports from the developing countries by negating significant cost advantages they enjoy. The issue is not the desirability by themselves of the norms sought to be prescribed, but that the attempt to enforce them through what amounts to imposing trade sanctions against the poorer countries deserves to be resisted and rejected. It needs to be recognised instead that to be able to introduce these norms the poorer countries need to raise their incomes and productivity levels, to which expansion of their trading opportunities should be expected to make an important contribution. Clearly, any attempt to further restrict their market access in the name of so-called social clauses will be a retrograde step even from the standpoint of the social objectives sought to be achieved. But to address these and other real issues meaningfully and effectively, the new government due to take office in Delhi in a few weeks will need to make a clean break with the empty rhetoric of the recent past and get serious about global trade negotiations which will go on, whether we like it or not.

ANDHRA PRADESH

Bipolar Contest

WITH the finalisation of the seat-sharing arrangement between the Telugu Desam Party (TDP) and the Bharatiya Janata Party (BJP) for the Lok Sabha and state assembly polls, Andhra Pradesh is all set to witness an essentially bipolar contest between the ruling TDP and the Congress. A host of non-Congress, non-TDP-BJP parties in the state stand in danger of being squeezed out of the political space even before the battle has begun. Some veterans like S Jaipal Reddy of the Janata Dal(S) and C Rajeswar Rao of the CPI, having read the writing on the wall, have either joined one or the other of the two formations or vacated their seats in their favour.

Though the TDP and the BJP were both on the look-out for allies to fight the Congress in the state, the final seat-sharing agreement reached between the two shows that it is the BJP which has had to yield ground. Despite its steady growth in the state, especially in the coastal Andhra and Telangana regions, the BJP is nowhere near being a force strong enough to fight

elections on its own. Differing with the party's state leadership, the central leadership of the BJP reckoned that having an ally in the TDP, even though the latter was not a part of the NDA, would not only enable the BJP to range one more party against the Congress in the post-poll scenario, it would also help to consolidate the anti-Congress vote in the state where the Congress has remained strong. Only against such calculations does the BJP settling for just eight Lok Sabha and 25 assembly seats (out of a total of 294) make sense. On the other hand, it was equally essential for TDP leader Chandrababu Naidu to project the impression that he had not given in to the BJP, especially in order not to lose support altogether among Muslim voters who can be decisive in quite a few parliamentary and assembly constituencies. Naidu also put off his decision to align with the BJP almost to the last moment so that even if there was dissension within his party over the decision, it would not have time to crystallise into organised opposition and affect the TDP's electoral prospects significantly.

Besides Muslims, women, especially rural poor women, are another important constituency that has been known to tilt electoral outcomes in Andhra Pradesh. Aware that the ending of the rice subsidy scheme and the scrapping of prohibition have alienated large sections of women, Naidu had to come up with a populist scheme such as 'Deepam' to supply subsidised gas connections to 10 lakh women below the poverty line. Though the scheme ran into rough weather with the Election Commission and has had to be put off, Naidu has given sizeable representation to women among his party's candidates, since the Congress, with Sonia Gandhi as its leader, is expected to play the women card in the elections. The TDP has put up new women candidates for the Jukkal, Paravathipuram, S Kota and Paderu assembly seats and for the Khammam and Guntur parliamentary seats.

The Congress, though better placed in Andhra Pradesh than in the other southern states, is plagued by dissensions which took an acrimonious turn when the Congress legislature party leader, P Janardhan Reddy, chose to defy the Pradesh Congress Committee president Y S Rajashekhar Reddy and launch his own separate election campaign. The party has also witnessed bickering over the large representation given to Rayalaseema in the party's election and campaign committees. If Chandrababu Naidu has to cope with the anti-incumbency factor, the Congress leadership, with its infamous record of frequent change of chief ministers when in power, has the problem of containing factionalism within the party.

CURRENT STATISTICS

EPW Research Foundation

The rise in the WPI has been exceptionally low; even the increases in the three consumer price indices have come down sharply, the 12-month rise in them ranging from 5.3 to 6.7 per cent compared with 8.9 to 12.4 per cent in the previous 12-month period. Apart from a very low rise in the WPI of 'food articles', there has been a significant fall in the index of manufactured food products. The WP food index thus shows a rise of only 1.1 per cent in the past 12 months in contrast to a 12.3 per cent increase in the preceding 12 months.

COLOUR-CHEM

Mixed Performance

SPECIALITY chemicals major, Colour-Chem, has five divisions – fine chemicals, pigments and additives, leather chemicals, textile chemicals, cellulose ethers and polymerisates. The company got out of the textile dyes business in 1995 in line with the global strategy of its then parent company Hoechst AG, which held 50 per cent stake in the company. The said business was transferred to DyStar India, which was a 100 per cent subsidiary of DyStar GmbH, a 50:50 joint venture of Hoechst AG and Bayer AG. However, since it was not possible to transfer the assets, Colour-Chem signed a toll manufacturing agreement with DyStar to manufacture dyes for a conversion fee that covers the fixed and variable costs and includes a margin.

With Hoechst AG now spinning off its speciality chemicals division and merging it with Clariant AG, the shares held by the former in Colour-Chem too are to be transferred to Clariant. However, although the merger to Colour-Chem and Clariant India (Clariant AG's branch in the country) could result in synergies, the conflict in interest due to the textiles dye business has indefinitely deferred this move.

Meanwhile, Colour-Chem witnessed a mixed performance during the year, 1998-99. While net sales declined by 8.2 per cent over the previous year, operating profit was higher by 71.8 per cent during the same period. However, a huge non-operating expenditure on account of its voluntary retirement scheme almost wiped out its profits during the year with its bottom line declining by 93.7 per cent. Despite the gloomy picture put forward by these figures, a closer look at the company's profit and loss account suggests that things are not as bad as they seem. If one were to exclude the previous year's non-operating income of Rs 29.5 crore (compensation for assignment of textile dye business) and the Rs 27.1 crore payment/provision for voluntary retirement scheme during 1998-99, the company's net profit scenario would sharply change for the better, showing a significant improvement in its performance during this period. Despite this, it is a fact that the weak economies in Asia Pacific, Latin America and Europe are

resulting in a rough time for companies engaged in manufacturing speciality chemicals. However, the silver lining for the company is that it has already spent a large amount on its restructuring programme, which entails strategic cost reduction through closures and outsourcing, relocation of its marketing office and closure of its hydrogen plant, not to mention the voluntary retirement scheme. This being a non-recurring expenditure, things could brighten up for the company in the coming years when its efforts bear fruit.

TELCO

Bumping Along

Tata Engineering and Locomotive Company (Telco), the country's largest truck maker, is on a bumpy ride following a slowdown in the economy. To make matters worse, the commercial vehicle segment, where the company is the market leader, was most affected by this slowdown and the market for these vehicles diminished by 9 per cent over the previous year. (This fall was even steeper at 35 per cent a year earlier.)

Following the alarming build-up of inventory, the company decided to curtail production significantly during the first half of 1998-99 to remedy the situation. However, this meant maintaining dealer inventories at lower levels, and a consequent decline in sale of medium and heavy commercial vehicles during this period (down 49 per cent). As a result, its market share in this segment fell by 11 per cent during the first six months of the year. Although the company did manage to increase its market share in this section by 4 per cent in the second half of the year, taking its total market share to 66 per cent, the damage had already been done. Net sales for the year fell by 10.7 per cent over the previous year, 1997-98, while operating profit declined by 24.3 per cent during the same period. A sharp increase in interest cost (up 27.9 per cent) and an 8.5 per cent higher depreciation took its toll on the company's bottom line, which crashed by 66.8 per cent during the year under review. Earnings per share dived from Rs 11.5 during 1997-98 to a mere Rs 3.8 during 1998-99, and the company decided to trim the dividend rate to 30 per cent (1997-98: 50

per cent) as a damage-control measure. In the light commercial vehicles segment, too, the company witnessed a 3 per cent fall in sales, while it underperformed the market in the multi-utility vehicle segment by posting a 5 per cent fall in market share to 28 per cent.

Ironically, while Telco's high degree of vertical integration is a boon for it in better times, this very factor is responsible for the company's underperformance in trying times. While it reaps all the benefits of producing virtually all its components in-house, the advantage turns into its Achilles heel when the going gets tough with the adverse situation magnifying itself all along the value chain. In an attempt to shake off its unwanted flab, the company is now planning to apply a strategy that is expected to transform it from a domestic truck maker to a world-class automotive company. The launch of the company's small car, the Tata Indica, in December 1998, was the first move in this direction. Realising its weakness, Telco has also decided to embrace outsourcing and shun high levels of vertical integration. Meanwhile, the outlook for the current year, 1999-2000, too appears bleak. The company has reportedly been saddled with a spate of cancellations of its Indica bookings (down 15 per cent) owing to delay in delivery. The company's sale of cars declined to 1,737 in April this year from 2,342 during the previous month. The bulk of Telco's passenger car sales volumes come from Indica, with the Sierra and Estate contributing minor volumes. In the medium and heavy commercial vehicle segment, too, sales declined from 9,745 units in March 1999 to 3,064 units in April, while that of light commercial vehicles fell from 4,374 units to 1,814 units during the same period. Though April is generally considered to be a lean period for the company, the near future appears gloomy for Telco, especially since the automotive sector has not shown any major signs of recovery.

HERO HONDA

On Full Speed

Hero Honda, the largest manufacturer of motorcycles in the country, is a 50:50 joint venture between the Munjals and Honda Motor Company of Japan. The

NA: means not available.

company has been going from strength to strength and had, only last year, declared a bonus issue to reward its shareholders and to affirm its good fortune. During the year, 1998-99, while net sales were higher by 33.8 per cent over the previous year, 1997-98, the company's operating profit jumped by 49.7 per cent, reflecting its improved operating efficiency, not to mention the considerable benefits derived out of its expanded capacity and its state-of-the-art plants in Gurgaon and Dharuhera consistently raising output. Though interest charges were higher by 19.3 per cent and tax provision increased by 55.9 per cent during this period, the company's bottom line advanced by 58.5 per cent. Encouraged by its performance, Hero Honda raised its dividend rate from 40 per cent last year to 75 per cent on the post-bonus equity, entailing a higher outgo.

The company has become the first and only motorcycle manufacturer in the country to touch record sales of 5,30,545 units during the year under review, which was a growth of 30 per cent over the previous year. To capitalise on the good demand for its vehicles, Hero Honda has now drawn up plans to invest around Rs 300 crore over the next three years in line with its strategy to roll out a new motorcycle model every year. The company seems to be determined to maintain its leadership position in the four-stroke motorcycles segment by offering choice and upgraded models to its customers. It had already launched a powerful 156 CC sporty-look motorcycle 'CBZ' in 1998-99 mainly to attract the young. The new models which will be introduced are expected to be in the range of 100-156 CC and are to be more technologically advanced than the existing 100 CC models. However, they will be priced lower than the CBZ model.

Meanwhile, Hero Honda's joint venture partner, Honda Motor Company, is planning to go solo on its scooter project after burning its fingers in its earlier scooter joint venture with the Fireflies of the Kinetic group. Reports suggest that these scooters will be produced by its other local venture, Honda Sael Cars India. However, the Japanese company will have to obtain a no objection certificate from the Munjals for the same as according to the shareholder agreement between the Munjals and Honda, Hero Honda has the right to manufacture all two-wheelers with the Honda brand name in India.

Industrial Recovery on the Horizon

GDP is expected to grow by 6 per cent in 1999-2000, the same as last year, but a major qualitative change expected this year is the possible recovery in the manufacturing sector after three years of sluggish growth; the impetus to recovery seems to have originated in increased availability of bank finance.

I Economic and Financial Trends

THERE are signs of recovery discernible in the real economy, led by some decent agricultural growth and renewal of consumer demand and infrastructure-related construction activity, as also looking up of investment demand in industry. Though in a cyclical recovery situation, pick-up in the output of investment goods is known to follow with a lag, it is interesting that an uptrend in it has already begun contemporaneously with the recovery in consumer and intermediate goods during the first quarter of this fiscal year.

Expectations are that GDP will grow by 6 per cent in 1999-2000, the same as in the previous year, but a major qualitative change expected this year would be the possible recovery in the manufacturing sector after three years of sluggish growth, if the first quarter indications are any guide. Real GDP originating in agriculture is expected to grow by about 2 per cent in the year on top of a rise of 7.6 per cent in 1998-99. Foodgrains production, which made a significant recovery by 5.2 per cent from 192.4 million tonnes in 1997-98 to 202.5 million tonnes in 1998-99, is expected to cross 205 million tonnes, a rise of 1.3 per cent, though the government has set an ambitious target of 210 million tonnes. Likewise, the index of non-foodgrains output is expected to rise by about 2 per cent after recording a smart spurt of 11 per cent in 1998-99.

In industry, the CSO's general index has

registered a rise of 6.3 per cent during April-May 1999 against 4.2 per cent last year. The highest recovery has taken place in consumer durable goods (a rise of 18.9 per cent against 4.7 per cent), followed by capital goods (15.4 per cent against 8.8 per cent) and intermediate goods (8.7 per cent against 5 per cent). Basic goods have continued to show a meagre growth of 2.2 per cent (3.2 per cent in April-May last year) due to persistent decline in output of coal and low growth of petroleum and petroleum products and hydel power. Among the major industries to contribute to the growth are white goods, automobiles (both commercial vehicles and others), cement, steel and non-ferrous metals, and significantly wide sections of electrical as well non-electrical machinery though growth in some of the industries has been over an unduly low base. On the other hand, while some agriculture-based industries like tea and jute have suffered a setback, some others like sugar, edible oils and coffee have experienced noticeable growth.

Indications of a possible industrial recovery are also seen in corporate sector data and data on banking and financial sector trends. Sales of manufacturing companies have registered a growth of 10 per cent in the first quarter of the current financial year, though pressure on their selling prices and bottom line has continued following recessionary conditions in industry. Excise duty collections have risen by about 29.5 per cent in the first quarter. In money and banking, bank credit to the commercial sector has shown a turnaround; there has been an expansion in non-food

credit by Rs 831 crore until July 16 this financial year, against a fall of Rs 5,899 crore in the comparable period last year. Including banks' investment in corporate bonds, etc, the accommodation provided by scheduled commercial banks has worked out to Rs 4,745 crore in the current year so far against a fall of Rs 908 crore last year. Better still, bank credit to the commercial sector (including from co-operatives and banks' investments in public trustee securities) is estimated to have risen by Rs 11,436 crore in the fiscal year so far against Rs 1,381 crore in the comparable period last year. Thus it could be said that the impetus for recovery has originated in higher disbursement of bank finance through a variety of instruments: conventional bank credit, investment in corporate bonds and, above all, in infrastructure bonds of state government PSUs.

As for investible funds from the capital market and FIs, the situation continues to be sluggish despite a buoyancy in the secondary market. Capital issues (other than through debt instruments included above) have remained meagre. So have been the operations of the all-India term-financing institutions – a fall of 19.4 per cent in sanctions and a rise of only a 3.8 per cent in disbursements in April-May 1999. In fact, the topmost institutions, IDBI and ICICI, have shown drastic reductions in their disbursements during the period.

A more negative influence on the investment impulse is, however, expected from the trends in budgetary disbursements. Available data suggest that the total expenditure of the central government at Rs 58,655 crore during April-June 1999 was lower by 1 per cent as compared with the previous year and the fall was the sharpest at 38 per cent in capital expenditure.

II Call and Forex Markets

The continued abundance of liquidity, combined with the market expectations of a cut in the Bank rate and the cash reserve

GRAPH B: SPOT QUOTATIONS FOR THE US DOLLAR IN THE DOMESTIC INTER-BANK MARKET - JULY 1999

ratio (CRR) following persistent decline in inflation rate and signs of industrial recovery, helped maintain the overnight call market steady and stable within a narrow range of 8.00 to 8.50 per cent except for a couple of days prior to the reporting Friday on July 16, when the rates touched 9.25/30 per cent due to the rush of banks to cover reserve needs ahead of the security auction on July 15 (Graph A); there were substantial outflows of funds from the banking system during the week ended July 16 (Table 1). The second half of the month saw the call rates ruling within a narrow range of 8.00 to 8.10 per cent; this was the period when there were return flows of funds (Tables 2 and 3).

An interesting feature of the call rate behaviour in the recent period has been its dissociation from its earlier anchor, the RBI's repo rate, after the latter was slashed from 8 per cent to 6 per cent on March 1. Since then the RBI's refinance rate and the Bank rate have been fixed at 8 per cent and the call money rate has remained range-bound at around that rate. In the current situation of abundant liquidity, what seems to be determining the call rate generally is the average cost of funds (deposits) for

the banking industry, and for the first time in the recent monetary history, the Bank rate and the refinance rate have generally coincided and also coincided with the banks' cost of funds. It is for the latter reason that the call rate is not generally falling below 8 per cent. The scheduled commercial banks have used the RBI's refinance window to the extent of about Rs 4,300 crore to Rs 7,100 crore during June-July, which has been, it appears, more to supplement banks' resources than to indulge in any significant arbitrage activities; in reality there has been less scope for such arbitrage between the refinance window and the call money market, or even between the money market and the forex market.

On the other hand, after the initial downward correction of the rupee value following the Kargil conflict though warranted by the inflation and interest rate differentials, the forex market remained stable throughout July; in fact, over the month, the rupee gained some ground; the exchange rate had touched Rs 43.38 to a US dollar in early July but thereafter it remained firmer with the rate touching a low of Rs 43.20 on July 20 and receding somewhat to Rs 43.29 by the end of the

month (Graph B). The easing of the rupee had to do with the continuous inflow of dollars from FIIs and expectations of further reductions in domestic interest rates. The last two weeks of the month, in fact, saw accretions of \$ 515 million to the country's foreign currency reserves.

The market rumours of a cut in CRR resulted in a further receding of the dollar forward premium, which was already falling and ruling at low levels. The annualised six-monthly forward premium, which was ruling at about 5.70 per cent towards the end of June, steadily fell to a little over 4.50 per cent by the end of July (Graph C). As forward premia have not been presaging any significant depreciation of the rupee in the near future compared with funds costs, importers are said to be keeping their positions open; at best the hedging takes place for the spot period, which is reflected in a firming up of the cash/spot premium (Graph D). Kargil type situations always created serious volatility in the rupee rate in the past as speculators took the slightest opportunity to strike speculative deals – a tendency which has now been severely curbed by the RBI by its policy and moral suasion actions. In fact, in the post-Kargil situation, the forex operators, itching for speculation, have been orchestrating pressure on the RBI to revoke the ban imposed in August 1998 on rebooking of forward contracts by corporates after their cancellation: this was done after it was found that the source of severe volatility in the forex market then was the buying and selling of spot dollars by corporates without booking the forward leg of the transaction; they were found to be misusing the freedom given to them in December 1993 to book spot and forward deals on two separate days. Instead, the importers would book only at spot rates and then cancel and rebook repetitively, thus significantly adding to the rupee's intra-day movements and boosting volumes. The RBI then ruled that the spot and forward legs had to be booked simultaneously and that the cancelled forward purchase contracts should not be rebooked. The fact of the matter is that it is not as though genuine hedging is not permitted for importers; it is just that repetitive cancellations and rebooking, which had a destabilising influence on the market, are not allowed.

Rupee Derivatives

On July 8, the Reserve Bank announced the final guidelines on interest rate swaps and forward rate agreements. The guidelines follow the credit policy announcement of April 1999 and allow participants – both, banks and corporates – to hedge their interest rate risks. Players have been allowed to use any rate prevailing in the domestic market as the benchmark rate for the purpose of interest rate swaps. Most of the deals used either Reuters' MIBOR or NSE MIBOR as the benchmark rate on day one. There is, however, no significant rate that has evolved to earn the status of a benchmark rate in the Indian scenario. Indeed, the Reserve Bank did disallow on the very first day a deal between two banks that had used forward rate as the benchmark rate. While the decision may have been based on abundant caution, the rejection of the deal highlighted the absence of a benchmark rate. Nevertheless, the market was anxiously awaiting the guidelines. The enthusiasm was reflected in deals worth over Rs 600 crore being recorded on the very first day. Of these deals worth Rs 500 crore were done on corporate account. The enthusiasm, however, faded with little interest in the products on subsequent days. In other words, absence of an effective benchmark rate may affect development of these products in the near future unless sincere efforts at market-making are made.

III Primary Market

Dated Securities

The government has completed over two-thirds of its gross borrowing programme or 80 per cent of its net borrowing programme by the middle of August. Interestingly, of the total borrowings, over 62 per cent have been through securities beyond 10 years. This was a much-needed strategy as the repayments peak in the coming two-three years.

There were four issues in July. First, there was the reissue of 11.90 per cent 2007 on July 1. As reported in the last month's review, the issue was closed with public subscription of Rs 1,305 crore and devolvement on RBI of Rs 1,195 crore; the cut-off price was Rs 100.30 implying a yield of 11.74 per cent. Second, the government re-issued 12.32 per cent 2011 paper for the third time through a price-based auction on July 15. For a notified amount of Rs 2,500 crore, the RBI received 119 bids for an amount of Rs 4,656.60 crore. The RBI accepted only 36 bids for an amount of Rs 1,173 crore at a cut-off price of Rs 102.14 with an implied yield of 11.97 per cent. The balance of Rs 1,327 crore devolved on primary dealers who attributed the devolvement to the timing

of the auction. The auction came at a time when the overnight call market was witnessing tightness, though temporarily, and the rate was around 9.25 per cent. Banks also were reported to have quoted high yields hoping to buy the paper at a discount from the primary dealers subsequently. With the RBI fixing an underwriting commission of 35 per cent, primary dealers were expected to pass on a part of it to buyers.

Thirdly, the government privately placed the 2.30 per cent 2016 stock worth Rs 2,500 crore with the RBI on the next day, that is, July 16. The placement was done at par.

Finally, the improved liquidity situation towards the end of the month again revived the interest in long-dated paper. The government re-issued 17-year 12.30 per cent 2016 by auction on July 29. The cut-off price of this paper was fixed at Rs 100.43 producing a yield of 12.24 per cent. The cut-off price matched the market expectations. For a notified amount of Rs 2,000 crore, the RBI received 181 bids for an amount of Rs 6834.50 crore. It accepted 28 bids for the notified amount.

Treasury bills

The short-term interest rates were ruling high and as such the Reserve Bank attempted at realigning the rates on short-term papers. While the central bank met with some success in cutting the rates for 14-day bills, which could be reduced by a significant 52 basis points, it was hard put to do so with the rates on bills of longer

DAY OF MAXIMUM TRANSACTIONS FOR JULY 1999

maturities in which there were considerable devolvments on primary dealers and on the RBI itself. The yield on 91-day bills was reduced by 29 basis points, that on 182-day bills by 4 points and on 364-day bills by 5 points. The relative yield on the 14-day paper at 8.60 per cent or so has been certainly much more attractive than the yield of 9.25 – 10.33 per cent for the 90-day, 180-day and 364-day papers. Therefore, the former has been attracting a good response. In the second auction of the month in this paper, the RBI received bids worth Rs 686 crore against the notified amount of Rs 100 crore; it accepted only one bid for the entire Rs 100 crore at a yield of 8.09 per cent thus slashing the yield from 8.61 per cent. Although the next auction saw the cut-off yield again rise to 8.66 per cent due to temporary stringency, the reduction was restored in the last auction as the market response improved (Table 4). The 91-day bills also seem to attract a steady flow of funds, though the RBI attempt to maintain a stable yield rate for it to serve as a bench-

GRAPH F: YIELD CURVE FOR DATED SECURITIES -
WEIGHTED AVERAGE FOR JULY 1999

mark rate has meant some devolvment (Table 5). While the devolvment has been very sizeable in the case of 364-day TBs (Table 7), there has been none in the new 182-day bills (Table 6).

Bonds Market

Activity in the primary bonds market remained buoyant, dictated by the needs of state-level public sector undertakings

and the financial institutions. In the first quarter of the current fiscal, over Rs 10,000 crore had been proposed to be mobilised through the primary issues of debt instruments, out of which the reported collection was Rs 6,135 crore.

In July, there have been fresh issues worth over Rs 4,500 crore, out of which about Rs 2,100 has reportedly been collected. The proposed amount including the carry-over of issues floated in the previous month, the total issues for collection amounted to over Rs 6,000 crore, against which more than 50 per cent or Rs 3,500 crore collection has been reported.

With the sole exception of Hindustan Organic Chemicals (HOC), all the issues in the PSU category were from state-level bodies. The government of Maharashtra came out with three issues (in addition to the one from MKVDC the closing date of which had been extended to August 10 due to poor response): first, Maharashtra State Road Development Corporation (MSRDC) proposed to raise initially Rs 400 crore, and later on, the issue size

was raised to Rs 950 crore in view of a wholesome reception. With a novelty of benchmark linked rates, it offered four options to investors: (a) 5-year 1-month bond with annual coupon of 13.65 per cent; (b) 10-year bond with 14.15 per cent; (c) 10-year bond with a coupon of 14.15 per cent for first year, and subsequently, the rate would be a spread of 2 per cent over the benchmark rate which is the weighted average secondary market yield on 10-year government of India securities; and (d) 12-year bond the coupon of which is 2.15 per cent over the PF rate which is currently at 12 per cent. The issue has been so successful that it has collected so far a reported amount of Rs 818 crore against the initial target of Rs 400 crore which was to be later revised upward to Rs 950 crore; the issue carries an option to retain an unspecified oversubscription.

The other two issues from the GoM are the Vidharhha Irrigation Development Corporation (VIDC) and Maharashtra Jeevan Pradhikaran (MJP). Both the issues are guaranteed by the state government, have a size of Rs 250 crore each, and are of 7-year tenure carrying 13.5 per cent coupon with YTM at 13.96 per cent. While the former has collected a mere Rs 95 crore, the response to MJP has been very encouraging as it has garnered over Rs 200 crore.

There were also new issues from the states of UP, Gujarat, Tamil Nadu, Sikkim, Punjab, Kerala, Karnataka and Himachal Pradesh. All the issues were of 7-year tenure and offered coupons rates between 12 per cent and 14 per cent. The 200-crore 7-year tripartite guaranteed bond from the Gujarat Electricity Board offered a coupon of 13.5 per cent for half yearly payment (YTM: 13.95 per cent) or 14 per cent for annual payment. In the form of security, the issue carried a tripartite agreement between the government of Gujarat, the trustees of the issue and the Electricity Board with regard to the payment of interest and re-payment of the principal amount. The issue has been fully subscribed. Tamil Nadu Industrial Development Corporation (TIDCO), which successfully met with the targeted amount of Rs 170 crore, hit the market with 7-year guaranteed bond to mobilise funds for the railway project in the state. Other issues, too, were getting good response from the investors.

ICICI was back in the market with Safety Bonds with a proposal to raise Rs 600 crore (which includes Rs 300 crore as greenshoe option). There have been some reductions in the interest rate offered from what it had offered in the previous issue in May. So is reduction in upper limit in the tenure which has been reduced from 23-year 10-month to 18-year 11-month on the Money Multiplier Bond. The interest rate, for instance, on the Encash Bonds

which earlier had 11 per cent for the first year is now been offered at 10.5 per cent. The Tax Saving option provides the benefits under sections 88 and 54EA. The issue which closed on August 5 has reportedly collected over Rs 300 crore. With this issue the ICICI also brought sub-brokers under the memorandum of understanding regarding incentives offered. Earlier, ICICI had already signed an MoU with brokers and lead managers to adhere to standardised incentive structures to control the unhealthy price-based competition among brokers. ICICI was also creating history of sorts by co-branding its bonds with consumer goods. ICICI-Bajaj Scooter Bond, ICICI-Maruti Relationship Bond, ICICI-Only Vimal Vaatsalya Bond, etc, were some examples of such co-branding. The bonds are deep discount bonds.

Close on the heels of the ICICI issue has been the issue from IDBI which is making its first foray in the current financial year. This public issue from the premier FI has proposed to raise Rs 1,500 crore which is inclusive of a greenshoe option of Rs 750 crore. When compared closely, one finds little similarity between the two issues. While ICICI is offering basically 3-year instruments, the IDBI has remained glued to a rather conventional tenure of 5 years. Even for the 5-year papers of both the FIs, IDBI is offering a better yield than the one offered by the ICICI. HUDCO also entered the market with two variants of its priority sector bonds with tenures of 7-year and 10-year to collect Rs 200 crore through book-building process. It has an option to retain an oversubscription up to Rs 200 crore. The indicative range of coupon rate for 7-year bond is 12-12.25 per cent and that of 10-year bond is 12.25-12.50 per cent. IL&FS launched a bond

fund and mobilised Rs 47.4 crore initially. The fund is open-ended. Earlier in June, UTI had also floated a bond fund and had received a good response. GE Capital also approached the market with the shortest 30-day debenture to raise Rs 50 crore. The fixed coupon rate is set at 9.6 per cent; but the floating rate is 100 basis points over MIBOR rate.

As for the closures, in view of abundant liquidity situation, invariably all the issues successfully met with the targeted amount.

There is a lot of activity in store in the bonds market in near future. The forthcoming issues include Tamil Nadu Electricity Board (Rs 500 crore), HP State Electricity Board (Rs 275 crore), Konkan Railway Corporation (Rs 250 crore), Rajasthan State Mines and Minerals (Rs 50 crore), Rajasthan State Road Transport Corporation (Rs 100 crore), Gujarat State

Notes: 1) Yields are weighted yields, weighted by the amounts of each transaction.

2) Current yield has not been worked out for treasury bills

Road Transport Corporation (Rs 150 crore), MTNL (Rs 978 crore), Bank of Maharashtra (Rs 170 crore), and Reliance Industries. In all about Rs 2,500 crore are sought to be raised through 6-month to 7-year tenure bonds with coupon rates ranging from 10.5 per cent to 13.15 per cent.

There was meanwhile a good demand for Indian debt by overseas investors. This was evident in the response to the \$ 100 million 7-year floating rate notes issued by Power Finance Corporation at end-June. The paper offered 145 basis points over LIBOR or 150 basis points spread at which the previous debt was issued.

Securitisation

Taking note of the growing market for securitisation, the Reserve Bank has set up an internal group to look at this product. The group is to prepare a status paper on securitisation and suggest further course of action to the Reserve Bank. The main issues involved in the development of securitisation relate to legal changes. Despite the legal hurdles there is a growing market of roughly Rs 10,000 crore of securitised credit as on date.

IV Secondary Market

There has been a quantum jump in the secondary market transactions in both government and commercial papers. As per NSE data, the daily turnover in government securities shot up from Rs 648 crore

in June to Rs 1,076 crore in July and that in all non-government securities from Rs 28 crore to Rs 55 crore (Table 9).

Gilt-edged Paper

The government securities market witnessed renewed buoyancy, with three phases seen in July: an early buoyant phase on reports of Pakistani withdrawal from Kargil followed by stable but firm prices ruling for about a fortnight; again a spurt during the week starting July 19 on rumours of a Bank rate cut along with a cut in CRR, but soon followed by selling pressure on July 24 when expectations were belied. Overall, four weeks ending July 30 saw a dated securities turnover of Rs 58,944 crore compared with Rs 50,230 crore during the four weeks ended June 25. Prices of long-dated securities firmed up considerably. In fact, the prices in the secondary market were capped only by the securities auction results. On rumours of an interest rate cut, the market built up huge positions in the government securities. Interest was predominant in long-dated securities, particularly in securities maturing between 2005 and 2008 and those maturing beyond 2009. Securities maturing between 2005 and 2008 traded to the extent of Rs 2,872 crore in the week ending July 9. After this week, however, the market interest shifted to securities maturing beyond 2009. The weekly trading volume in these securities was Rs 1,454 crore, Rs 2,917 crore and Rs 2,325 crore

in the week ended July 16, 23 and 30, respectively (Appendix Table). As a result of such buoyancy, the prices of securities sharply firmed up and yields witnessed a sharp fall over the month. Interestingly, the fall in the yield rate has been observed in papers of all maturities. For instance, for securities maturing during 2000-01 the minimum of YTM fell from 10.33 per cent to 9.25 per cent, for those maturing during 2004-05 from 11.18 per cent to 11.16 per cent and for those maturing after 2009 from 11.76 per cent to 11.63 per cent. As a result, the yield curve has appeared to be a steeply upward slopping one during the first and second halves of the month (Graphs E and F).

Repos and OMOs

Given abundant liquidity that buoyed the government securities market yielding higher returns, no applications were received since June 7 in the daily repos conducted by the RBI at a fixed 6 per cent. On the last day of the month, that is, July 31, however, there was a sole application of Rs 12 crore and the next working day, that is, on August 2, Rs 33 crore. The repos once again became dormant after this.

The RBI's OMOs too were considerably less aggressive during July. In four weeks, the RBI conducted OMOs only worth Rs 223 crore, bringing the total OMOs of 1999-2000 so far to Rs 18,620 crore as on July 23; there were OMOs during the week ended July 31. Even the repo transactions outside the RBI were very low in July – only Rs 1,372 crore as against Rs 3,432 crore in June (Table 8).

Non-bank Entities and Repos

The RBI allowed 35 non-bank entities in the repo market on July 19. Non-banking entities, such as, primary dealers, financial institutions, mutual funds, gilt funds and insurance companies will now be able to borrow from the call money market through repos with other institutions notified by the government. While deepening the repo market, this is also the first step towards moving the non-bank entities out of the overnight call market.

Bonds

The secondary market showed a renewed interest in PSU bonds, floating rate bonds and CPs (Table 9). Total transactions in taxable bonds shot up from Rs 81 crore (or a weekly average of Rs 20 crore) to Rs 197 crore (a weekly average of Rs 33 crore). Likewise, dealings in floating rate bonds (from Rs 90 crore to Rs 190 crore) and CPs (Rs 308 crore to Rs 616 crore).

[V P Prasanth, Rafiq L Ansari and Dipi Parikh were actively involved in the preparation of this note]

Agriculture and Economic Reforms

R Thamarajakshi

It is time that efficiency considerations prevail in public spending in agriculture and market signals are allowed to come into full play so that changes in agricultural investment and production are demand-driven in response to domestic and international prices. Government should focus on productive investment, technology and research, marketing and storage and agro-processing facilities and provision of food safety-nets for the vulnerable poor and development of a diversified agriculture in line with emerging demand patterns.

It is generally recognised that the ongoing economic reforms have not directly involved the agricultural sector. There has, however, been emphasis on increasing exports of agriculture-based products, on futures trading for certain agricultural commodities and on development of agro-processing and cold storage facilities. There are also indications of corporate interest in some subsectors of agriculture. But a comprehensive agenda for reforms in agriculture has yet to emerge. Obviously, the content of such an agenda would be one of making farming and allied activities competitive, guided by market forces. Clearly this cannot be on par with industrial reforms, as questions of management of food policy and food security, constraints and inflexibilities in regard to changes in cropping pattern and input subsidies, e.g., on fertiliser, power and irrigation, are involved. Perhaps that is why reform policy has, for the present, not been able to go beyond agricultural export promotion. In the meanwhile, given the linkages of agriculture with the rest of the economy and continued dependence of two-thirds of the labour force on agriculture, economic reforms in the organised sector accounting for only about 10 per cent of the workforce and 40 per cent of domestic product have implications for relative investment, productivity and incomes in the agricultural sector as also in the non-agricultural, informal sector. In what follows, it is proposed to outline these developments in agriculture during the reform period.

Investments in agriculture: With the emergence of emphasis on a market-based system, the share of overall public investment in total investment in the economy has been declining even from the early eighties (a period which was a curtain-raiser for industrial reforms partly by choice

and partly on advice from international lending institutions) when industrial reforms were launched in the first instance; the share of public investment in all sectors taken together declined from 47.8 per cent during 1980-85 (Sixth Plan) to 34.3 per cent during 1992-97 (Eighth Plan). Further the share of public investment has also fallen short of planned investment. Apart from the fact only 8 per cent of total public investment had gone to agriculture during 1992-97, the shortfall in actual investment in this sector compared to planned level was around 40 per cent. Significantly, in this period, actual public investment in the tertiary sector exceeded the planned level (Table 1).

A comparison of sectoral growth of gross capital formation (GCF) at constant (1980-81) prices in the pre-reform period (1985-91) and reform period (1991-97) throws up important aspects with reference to agriculture. Real GCF in agriculture has been around 10 per cent only with 90 per cent going to the non-agricultural sectors. As against an increase of 46 per cent in overall GCF in the reform period over the pre-reform period, that in agriculture was less at 36 per cent (Table 2).

Since agriculture is basically a private activity, public investment has a critical role to play in creating the infrastructure in terms of irrigation, roads, markets, storage facilities, electrification and technology development, besides education and health. Not only is there a need for sizeable public investment, but also it should have a definite content and focus as above. In this context, GCF in the public sector in agriculture both in absolute and relative terms has been rather low whether in the pre-reform or reform period, besides recording a decline in the latter period; real GCF in agriculture in the public sector

declined by 14.3 per cent compared to an increase of 13.3 per cent in total public sector GCF. While GCF in private sector rose in agriculture, the rise was lower (58 per cent) than that in non-agriculture (74 per cent) apart from the fact that the absolute size of private sector GCF in agriculture, although much higher than public sector GCF in agriculture, was comparably quite low in relation to the size of private sector GCF in non-agriculture (Table 3).

During 1993-98, while around 6 per cent of public sector GCF was in agriculture, the corresponding figure for the private sector was about 9 per cent, the decline in the case of private sector

(ii) NSSO, Employment-Unemployment Survey: 50th round (1993-94) and 53rd round (1997) Assumed 1997 WFRs obtain for 1998-99

irrigation is crucial. Investment in major, medium and minor irrigation and CAD in the reform period stood at Rs 51.5 thousand crore which was slightly (4 per cent) higher than that in the pre-reform period, with more than two-thirds of total investment in irrigation going to major and medium irrigation and CAD in both periods. Plan spending on irrigation has declined from 10 per cent in the Sixth Plan to 7.6 per cent in the Seventh Plan and to 6.4 per cent in the Eighth Plan (Table 5).

During the reform period, area under major and medium irrigation increased by 2.1 million hectares compared to near constancy in the pre-reform period. However, area under minor irrigation in the former period rose by 5.8 million hectares compared to 8.3 million hectares in the latter period (Table 6).

Production and value added: There was no acceleration in the growth of agriculture despite the fact that the per cent of value of modern inputs (fertilisers, pesticides, electricity and diesel oil) at constant 80-81 prices to the value of gross agricultural output marginally increased from an average 11 per cent during 1985-91 to 13 per cent during 1991-96 and, more particularly, the per hectare consumption of fertilisers rose perceptibly from 56.7 kgs to 70.6 kgs in the periods under comparison. In fact, the compound growth rate of foodgrains production dropped to 1.66 per cent per annum during 1990-98 from the peak level of 3.54 per cent per annum during 1980-90 and the average growth rate of gross value of output of agriculture at 1980-81 prices in the reform period was lower at 3.1 per cent per annum than that during the earlier period at 4.3 per cent. A similar pattern as in the growth of gross value of agricultural output has occurred in gross value added. The average growth rate of GDP from agriculture during 1993-99 was less than that during 1987-94. Besides, the average growth rate of GDP from agriculture during 1987-99 as well as 1993-99 was lower than that of GDP from the non-agricultural sectors. Since the sectoral distribution of workforce has remained almost constant in these periods, the differences in inter-sectoral growth have led to considerably lower levels of per worker value added in agriculture vis-a-vis the non-agricultural sectors. The average annual growth rate of per worker value added in agriculture during 1993-99 was less than that during 1987-94, whereas the corresponding growth rates in secondary and tertiary sectors in the recent period were higher than the respective

rates in the earlier period. In both periods, the growth rate in the case of the agricultural worker was less than that of his counterparts in non-agriculture (Table 7).

During 1987-99, the share of agriculture in real GDP declined from 31.6 per cent to 26.8 per cent while that in workforce remained at 64 to 65 per cent. Consequently per worker value added in agriculture which was 28 and 24 per cent of that in the secondary and tertiary sectors in 1987-88 declined to 27 and 22 per cent respectively in 1993-94. The relative per worker value added in agriculture vis-a-vis the non-agricultural sectors became more adverse in 1998-99 with the former coming down to 23 and 18 per cent respectively of the respective per worker value added in the secondary and tertiary sectors. This is notwithstanding the improvement in agriculture's barter terms of trade during the nineties; also in foodgrains terms of trade particularly after 1993-94. The improvement in foodgrains terms of trade along with the observed deterioration in relative per worker value added in agriculture would impact on the poorer sections of the agricultural population who are net purchasers of foodgrains (Table 8).

Real Wages of Agricultural Labourers and Poverty: There has also been an increase in the proportion of casual labour mainly at the cost of the self-employed; of the workforce, about 34 per cent of rural males and 46 per cent of rural females are casual workers. While this has been accompanied by a rise in real wage earnings, this is a continuation of the uptrend that started in the eighties, and the rise in the six-year period of 1987-94 was only

TABLE 8. SECTORAL SHARE OF GDP AND WORKFORCE AND INDEX OF VALUE ADDED PER WORKER

	1987-88	1993-94	1998-99
Primary sector			
GDP	31.6	30.3	26.8
Workforce	64.1	64.4	64.7
Value added	100.0	100.0	100.0
Secondary sector			
GDP	28.2	25.8	26.5
Workforce	16.2	14.8	14.6
Value added	351.2	370.7	437.4
Tertiary sector			
GDP	40.2	43.9	46.7
Workforce	19.7	20.8	20.7
Value added	413.1	447.8	542.5

Notes: (i) GDP and workforce in different sectors are percentages respectively of total GDP at 1993-94 prices and total workforce.

(ii) Workforce pertains to 15+age groups.

(iii) Value added is index of per worker value added at 1993-94 prices.

5.9 per cent. Besides, the absolute levels of rural wages in 1993-94 were lower than the minimum levels to assure a reasonable level of living, let alone a reasonable level of social security for the agricultural labourers.¹ Further it may be that but for the improvement of foodgrains terms of trade in the nineties, real wage increases would have been higher. A slackening in the rate of annual growth of real wages from 4.8 per cent in the eighties to 2.4 per cent in the nineties so far has also been noticed.² Although there is an estimated decline in poverty ratios, the percentage decline in rural sector has been less at 4.6 per cent, compared to 15.2 per cent for urban sector in the recent period, 1987-94. This is despite the disbursements in this period of a total sum of Rs 14,000 crore (at 1981-82 prices) for rural poverty alleviation programmes. There is also a view³ that there is no strong evidence of a decline in the incidence of rural poverty since 1993-94.

Suggestions: The above discussion points to the urgent need for implementing a reform agenda for agriculture comprising enlarged productive investment by public sector in infrastructure for agriculture and a market-based pricing system for agricultural products and inputs. It is true that the declining trend in public investment in agriculture and the relatively small share of agriculture in public as well as private investment were observed even in the eighties and these continued in the nineties also. Similarly, the increase in private sector investment in agriculture is noticed even during 1985-90, prior to reform period and this trend continued into the nineties.

In regard to exports, according to a reported CII study, there has been no structural shift in India's export basket in the post-liberalisation period. The latest *Economic Survey* has observed that the share of agriculture has been more variable than that of manufactured exports, declining during 1991/92-1994/95, rising in the subsequent two years and dropping again since 1997-98. Given the significance of agriculture for the provision of productive employment and social safety nets in the context of industrial restructuring, and also for growth of agro-based exports, steps should have been taken alongside industrial reforms to reverse the declining trend in public investment and to raise the levels of productive investment in agriculture. This has obviously not happened.

As of now, enormous sums of irrigation, power, fertiliser and food subsidies

dominate public spending on agriculture. Food and fertiliser subsidies alone account for Rs 20,000 crore, leaving little scope for essential productive investment by the public sector in physical and social infrastructure. Immediate steps to downsize these subsidies and rationalise the pricing of inputs are required. At present, there are inflexibilities in the pricing of both agricultural outputs and inputs. With the obliteration of the distinction between procurement and support prices for quite some years now, support operations for cereals are undertaken at the higher levels of procurement prices which are also annually increased. But whereas the eighties saw the revision of central issue prices almost annually, this has not been the case in the nineties. Partly due to this and partly due to the restraint on prices of manufactured goods following liberalisation policies, the domestic barter terms of trade and specially foodgrains terms of trade have moved in favour of agriculture during the reform period. Clearly, such improvements benefit those who have marketable surpluses to offer, and cause hardship to the rural poor who purchase their foodgrains from the market. As a matter of fact, notwithstanding this improvement in relative prices, there has been a deceleration in the growth of agricultural production and foodgrain production in particular. Also, relative

value added from agriculture on a per worker basis vis-a-vis non-agriculture has worsened in the reform period. Despite large food subsidy and massive expenditures on anti-poverty programmes, rural poverty has not significantly declined. It is time that efficiency considerations prevail in public spending in agriculture and market signals are allowed to come into full play so that changes in agricultural investment and production are demand-driven in response to domestic and international prices. The role of government is to focus on productive investments, technology and research, marketing and storage and agro-processing facilities and provision of food safety nets for the vulnerable poor, and development of a diversified agriculture in line with emerging demand patterns.

The Fallacy of 'Augmentation'

Demands on Ganga Waters

Ramaswamy R Iyer

India and Bangladesh argue that their lean season requirements are greater than the Ganges flow. Both agree that 'augmentation' is the solution. But true augmentation can only come from efficient use of water and tapping other sources of water. In the case of a natural resource such as water, requirements are to be brought down to the level of availability of river flows, not the other way around.

IN the Indo-Bangladesh talks over the last two decades and more regarding the sharing of the waters of the Ganga at Farakka, a persistent theme has been 'augmentation'. As early as 1974, it was agreed in the 'joint declaration of the prime ministers of India and Bangladesh' that there was not enough water in the Ganga in the lean season to meet the combined needs of the two countries and that those flows would need to be augmented. The 1977 agreement between the two countries was both a five-year water-sharing agreement and an agreement to work out an acceptable proposal for augmenting the lean season flows. 'Sharing' and 'augmentation' were two equally important and linked components of that agreement, as also of the 1982 and 1985 memoranda of understanding. It was only the 1996 treaty that for the first time refrained from linking the two ideas: it was essentially a water-sharing treaty. Nevertheless, that treaty too contained a reference to augmentation in the Preamble as well as in Article VIII, which stated that "the two governments recognise the need to co-operate with each other in finding a solution to the long-term problem of augmenting the flows of the Ganga/Ganges during the dry season".

Thus 'augmentation' is an old and accepted idea. There was a divergence between India and Bangladesh on how the augmentation was to be achieved. The Indian view was that Ganga was water-short and needed to be augmented by a diversion of waters from the Brahmaputra which had a large surplus. Bangladesh argued for an augmentation within the Ganga system by storing a part of the seasonal high flows behind seven large dams in Nepal. Each side had serious reservations on the other's proposal. This divergence was one of the reasons for the prolonged impasse between the two countries over the Ganga waters issue; even-

tually, it was only by putting the augmentation question aside that a sharing treaty could be concluded. It is not necessary to go into that old controversy here. What needs to be noted is that both sides are in complete agreement on the need for an augmentation of the lean season flows of the Ganga. Now that 'sharing' has been settled, talks over 'augmentation' are likely to be resumed.

The case for augmentation can be broken down into two propositions: (i) that there is a shortage of water in the Ganga; and (ii) that this should be made good by an addition of water to the Ganga from somewhere. Both those propositions need to be looked at closely, but first the very notion of 'augmentation' (which has become so familiar that we tend to take it for granted) has to be examined.

'Augmentation' implies an addition to the available water. But can we really add to the quantum of water in the Ganga by building storages upstream? The answer is clearly 'no'. We cannot increase what is available in nature. What we can do is to hold back a part of the high flows behind a dam and release it during the lean season. In other words, 'augmentation' means no more than a modification of the seasonality of the flows. This can be thought of not only in the case of the Ganga but in the case of other seasonal rivers as well. Should we then undertake the modification of the seasonality of all seasonal rivers? Such a proposition is not likely to be seriously argued. There is no such thing as an augmentation project: no project is ever proposed merely for that purpose. If dams are to be built at all, they will have to be built for other purposes, such as irrigation, power generation, flood moderation, and so on. The 'augmentation', if any, of lean season downstream flows can only be an incidental and secondary consequence of a project built for other purposes.

Further, while 'augmentation' (of downstream lean season flows) is problematic because it is bound to be subordinated to the primary objectives of the project in question, a reduction of downstream flows in the major part of the year is a certainty. All dams stop flowing waters for the purpose of storing, diverting and using them, and must therefore necessarily reduce downstream flows. This usually figures as a prominent element in the enumeration of the adverse impacts of damming a river. A reduction of downstream flows could have several consequences: it could affect the river regime, cause serious problems to aquatic life and riverside communities, hamper economic activities such as fishing, the plying of boats, agriculture, etc, impair the self-regenerating capacity of the river and affect water quality, diminish groundwater recharge, adversely affect estuarine conditions, lead to the increased incursion of salinity from the sea, and so on. One of the issues in the Narmada controversy is the impact of the dam on downstream areas. In the Cauvery dispute, the complaint of Tamil Nadu is that the flows into that state have been reduced by the building of storages by Karnataka. Lower riparians can be normally expected to object to the building of dams upstream. It is therefore rather strange that Bangladesh is actually asking for dams to be built in Nepal! If Farakka had not come into existence and the question of 'sharing' and 'augmentation' had not arisen, Bangladesh would probably have strenuously objected to any dam-building proposals in India or in Nepal on the ground of adverse impacts. The short point is that 'augmentation' and 'reduction of flows' are the obverse and reverse of the same coin, and that we cannot have the one without the other.

A diversion of waters from the Brahmaputra could of course mean an addition to the flows of the Ganga. Bangladesh is not convinced that there is in fact a surplus in the Brahmaputra for diversion; leaving that aside, we must note that such a diversion project would have its own environmental, social and human consequences. The Indian proposal (of the 1970s) of a Brahmaputra-Ganga link canal running through Bangladesh was objected to by Bangladesh on many grounds, at least some of which were valid. That proposal is not being seriously pursued now, and in any case, it is very unlikely that Bangladesh will ever accept it. The alternative of a link canal running entirely

through Indian territory seems unlikely to be a viable proposition. Such long-distance water-transfers are highly problematic and extremely difficult to justify. Insofar as India wishes to utilise the waters of the Brahmaputra, it will have to explore more modest possibilities within the north-east and the immediate neighbourhood (perhaps including limited transfers between adjoining rivers within the Brahmaputra system) rather than think in terms of a large transfer westwards.

'Augmentation', then, is a very dubious proposition. Let us now return to the question of the need for it, as perceived by the two governments from the 1970s onwards. Taking the 'shortage' argument first, the perceived inadequacy of Ganga waters is based on the fact that while the lowest '75 per cent dependable' flow in the river in the leanest part of the lean season was determined as 55,000 cusecs, each of the two countries projected its own need for Ganga waters as equal to or exceeding that quantum. However, how reliable are those estimates of demand? Apart from the fact that each country tended to overstate its claim because of the existence of a dispute, it must also be noted that the projections were based on the prevailing patterns of water use. If a careful estimate were made in either country with due regard to economy and efficiency in the use of this precious natural resource, we may well find that the two countries can manage with much less water than they think they need. The 'shortage' in the Ganga may turn out to be a myth based on the present wasteful and profligate use of water. In terms of water endowment, the areas that we are concerned with here are not among the most water-stressed in the world; there are countries (in west Asia, for instance) which have much less water and have learnt to use that water very carefully. From their point of view, our complaints about a shortage of water in the Ganga may sound strange and incomprehensible.

As for the second part of the proposition, assuming that after a careful examination the combined needs of the two countries are in fact found to exceed the lean season flows in the Ganga, does it follow that those flows should be 'augmented', i.e. that more water should be added to the Ganga from somewhere, whether from within the Ganga system or from another river, for being taken out and shared? That is a very odd idea, the strangeness of which has been blunted by repeated iteration. It is necessary to get away from

familiar and accustomed grooves of thinking and take a fresh look at this matter.

Where a river runs through more than one country, the countries concerned must reach an agreement on the sharing of the waters of that river. Such an understanding has in fact been reached in relation to the Ganga, and embodied in the 1996 treaty. There is nothing more to be done insofar as the Ganga is concerned, except to resolve such practical difficulties as arise in the actual operation of the treaty. If indeed there is not enough water in the Ganga, then the two countries should look to other sources. There is no reason why they should think in terms of putting more water into the Ganga ('augmenting' its flows) for the purpose of being taken out and shared, as if all water must necessarily come only from the Ganga.

What the two countries must do is to take a look at the totality of their water needs and the totality of water availability in all forms (other rivers, surface water bodies, groundwater, deep aquifers, soil moisture, wetlands, and of course rainfall), and make careful plans for proper resource management on a holistic and integrated basis. (Incidentally, local water conservation through water harvesting and

watershed development would in fact constitute true 'augmentation'.)

The recommendation that emerges from the foregoing analysis is that the two countries should stop talking about the 'augmentation' of the lean season flows of the Ganga, and instead, think in terms of good water-resource management. Such efforts will be essentially internal to each country, but there can be a sharing of experience between countries, and co-operation in areas close to one another.

It is conceivable that one or more of the projects in Nepal (Karnali, Pancheswar, Sapta Kosi) that have been talked about may survive the most stringent scrutiny from all angles (including that of downstream impacts), prevail over all opposition, obtain the necessary finances, and actually get constructed; and that it (or they) may in fact result in increased lean season flows at Farakka as a secondary consequence. One is profoundly sceptical regarding this possibility, but if it happens, the increased flows will of course be available for being shared by the two countries under the Ganga treaty. This article is questioning not such a contingent (but remote) possibility but the soundness of 'augmentation' as an idea and an objective.

End of the Congress: New Turn in Bengal Politics

Poromesh Acharya

The 1999 parliamentary election may well prove to be a turning point in West Bengal politics. The Congress and the CPI(M), it has been alleged, have come to a tacit understanding. True or not, it is a fact that the Congress is in no way a threat to the CPI(M). Mamata Banerjee is now the real enemy. At the same time, Mamata Banerjee's emergence as the principal opposition force is also an ominous sign.

BENGAL politics is likely to take a new turn after the 1999 parliamentary election. A long innings of Bengal Congress is going to be over. New teams are awaiting for their turn. Never before was Bengal Congress in such a pitiable condition as is now. There are no doubt many reasons for this decline of Bengal Congress. But the process had set in long before. The most important reason, however, may be the absence of any political ideology required for maintaining the real unity of a political party. In the absence of any ideological position, power may act as some kind of adhesive. But erosion sets in when not in power for long. And that has happened to Bengal Congress. Bengal Congress had no ideological position in near past but the hangover of being in power for nearly 30 years after independence allowed the party to nurse the illusion of regaining it. Twenty-three years of Left Front rule shattered the illusion of regaining the power. And that was too much for an outfit of assorted political manoeuvrers.

The party struggled for survival with only the negative slogan of CPI(M) misrule and corruption. However true the charge, it did not carry much weight as the credibility of the people who had put it forward was much in doubt. It was widely believed that many Congress leaders had acquired considerable property by dubious means and often with the connivance of or patronage from CPI(M) functionaries. Obviously, the issue raised by the Congress lost much of its edge. In fact, the CPI(M)-led Left Front could survive in power so long because the people of Bengal did not like to accept the Congress as the alternative. The carrot and stick policy of the Left Front yielded results. The negative slogan of Congress did not click, but CPI(M) survived in power on the strength of negative votes.

The real decline of Bengal Congress started during the rule or misrule of

Siddhartha Sankar Ray. The general belief is that the massive rigging through which he came to power was an insult to Bengal's pride. The notorious regime was marked by police killings of about a thousand naxal youths and more than a hundred CPI(M) cadres. The heinous crimes committed by Ray's police during 1970-71 were a blot on the political history of Bengal. Bengalis never could forget that. Besides, the new generation of leaders who came up during this period ultimately proved to be a burden for the party. These self-seeking band of leaders without any exposure to the traditional Congress movement in no time pulled apart the party into centres of personal fiefdom with notorious elements loyal only to individual leaders. The process of disintegration that commenced under Ray's leadership is now nearing completion. The firebrand Mamata Banerjee played a major role in accelerating the process.

It may be true that there is a long tradition of inner-party feud and personal bickering among leaders of Bengal Congress. It is also true that inner-party feuds on occasions led to the formation of separate provincial committees. Instances are there also of launching of separate political outfits. The leadership struggle among Subhas Chandra Bose, Jatindranath Sengupta and Birendranath Sasmal after the demise of Chittaranjan Das may be mentioned as an example. It was not just fair competition for leadership among rivals. It went far beyond that. The leadership struggle between Saratchandra Bose and others of Bengal Congress in the forties was not clean. Neither was the ouster of the Gandhian leader Prafulla Ghosh from the premiership of Bengal after independence by the Bidhan Chandra Roy and Kiransankar Roy group with the help of another Gandhian leader, Prafulla Chandra Sen, and Atulya Ghosh be said to have been fair. But all these did not pose any

threat to the existence of the Congress in Bengal. The most severe blow before Mamata's punch had come perhaps from Ajoy Kumar Mukherjee in the late sixties, when after quitting the Congress he formed the Bangla Congress and paved the way for the United Front with the CPI(M) to come to power after defeating the Bengal Congress for the first time after independence. Even this could not finish the Congress. It survived, though with depleted strength. The Congress vote bank absorbed the shock and remained more or less constant till 1996.

It may be noted that though the Congress could not come back to power, the percentage of non-Left votes did not decline over the years in any significant way. In the 1984 parliamentary election, the Congress and its allies and the Left Front received almost equal votes. The Congress and its allies got 48.2 per cent of the total valid votes cast and the Left-Front 48.4 per cent, though the Congress won only 16 parliamentary seats. After the 1977 election this was the peak reached by the Congress. However, it continued to get around 40 per cent of the valid votes in subsequent elections as well, except in 1991 when it got 36.92 per cent. The total non-Left votes did not decline in any appreciable way after 1984. In the 1991 election the BJP took away 11.65 per cent of the non-Left vote. In the 1996 parliamentary election the Left Front got 49.08 per cent of the valid votes while the Congress got 40.09 per cent and the BJP 6.88 per cent. The voting disparity between the Left Front and the Congress may not have been very significant in terms of their respective popularity. The difference may have been due to the better organisational ability of CPI(M) and also the advantage it had of being in power. It is evident that till 1996 the Congress was a force to reckon with.

A perceptible change in the pattern of voting was noticed in the 1998 parliamentary election, after the birth of the Trinamul Congress (TMC) of Mamata Banerjee and the emergence of a new alliance between the TMC and BJP in West Bengal. There was a sharp decline in the Congress vote. However, the Left Front did not benefit from this decline of the Congress vote. Out of 42 parliamentary seats, the Congress could manage to win only one seat in Maldah. More significant is the fact that the BJP opened its account winning a seat for the first time, that too defeating a sitting CPI(M) member of parliament from the red bastion of Dum Dum. In terms of votes as well there was a significant change. The Congress vote

was reduced to a low 16.45 per cent while the TMC-BJP alliance got 34.62 per cent. Together they got 51.07 per cent, which shows a slim but sure non-Left majority. The Left Front received 46.83 per cent and the CPI(M) alone 35.41 per cent. The Left Front, however, was able to retain the same number of seats as in the previous election with a marginally reduced vote. The percentage of votes for BJP went up to 10.19 per cent, while the TMC got 24.43 per cent of the valid vote. It is unlikely that the Congress will ever be able to reverse the erosion in its vote bank. Not being in power for so many years and without any hope for regaining it, the Congress is destined to be in the doldrums.

The fall of Bengal Congress cannot be explained properly without an understanding of the rise of the TMC in the existing scenario of Bengal politics. If corruption, nepotism, maladministration and deterioration of the service sector were factors influencing the voters, neither the Congress nor the Left Front should have won any election. But the voters had no choice. Bengal Congress, a leaderless and rudderless party with a condemned past, cannot be an alternative to the Left Front which is organisationally far superior and is led by a power-loving but seasoned leadership capable of maintaining a 'bhadralok' appearance. The Congress took nearly 30 years to be deprived of all its ideological trappings and be condemned as a party of power-mongers. But power has gone to the head of the leaders of the Left Front in 23 years. Now they have also been charged with suffering from the same power-related diseases and to have lost all their ideological moorings. In the process people also lost almost all inspiration for political and social initiative.

It is in this gloomy scenario of Bengal politics, when the people were looking for a third alternative with all of their scepticism, that Mamata Banerjee emerged as the principal opposition leader, touching the right political note and at the right time. Both the Bengal Congress and the Bengal Left are responsible for her emergence in Bengal politics as a major player. Notwithstanding the infantile disorders she suffers from, people by and large believed her to be honest and a leader capable of fighting the corruption and high-handedness of Left leaders and cadres. She has been able to build up the image of an uncompromising anti-establishment leader and a friend of the poor. In the context of the frequent violent inter-party clashes that are taking place, particularly in rural Bengal, leading to many deaths and considerable destruction

of property, and the general perception of the partisan role of police, Mamata Banerjee has emerged in the public eye as a champion of the suffering people. It is interesting that even among the followers of other Left parties, particularly among those who have suffered at the hands of the over-zealous CPI(M) cadres, there are quite a few who have a soft corner for her. There is no doubt that she is the only anti-Left leader in Bengal who has a growing mass base. It was she who charged the Congress with being the 'B-team' of the CPI(M) and could make the charge credible to the people. In the process she sounded the death-knell of the Bengal Congress.

In the ensuing parliamentary election, the Bengal Congress is not likely to get a single seat without the tacit support of the CPI(M) at the local level. Except the lone seat they had won from Maldah in the last election, there may be one or two other constituencies, like Raigunge in West Dinajpur and Berhampur in Murshidabad district, where the Congress candidates are likely to offer any challenge. The fate of the new alliance of TMC and BJP will largely depend on how far it can win over the Congress voters in this election. The alliance can ensure the victory of its candidates only through the forfeiture of the security deposits of Congress candidates. Otherwise the Left Front will sweep the polls, gaining from the division of non-Left votes. There may be considerable erosion in the original Left vote, but the CPI(M) will make an all-out effort to make up for this erosion with its organisational strength and well-oiled so-called technical machinery. All political parties try to take recourse of this method, but the most organised one naturally derives the most benefit. In a close contest this ultimately determines the result and the ruling party is likely to be the gainer in this game.

The 1999 parliamentary election may well prove to be a turning point in Bengal politics. Allegations are there already that the Congress and the CPI(M) have come to a tacit understanding to fight the common enemy. However, if the Congress does not suffer heavily at the hustings, the survival of the TMC as the leader of the third alternative will be at a stake. If Mamata Banerjee can increase the votes of her party, diminishing the Congress vote-bank and winning a substantial number of floating votes, her political future will be assured. On the other hand, a decrease in the number of votes compared to what her party had got in the 1998 election will surely spell trouble for her political existence. The Left Front, particularly the

CPI(M), will make an all-out effort to cut her down to size, whether by hook or by crook. The Congress is in no way a threat to the CPI(M). Mamata Banerjee is now the real challenge.

Mamata Banerjee's emergence as the principal opposition leader is also an ominous signal for Bengal politics. This is not because of her gimmick-proneness nor for her lack of aptitude for the so-called dignified political tradition of the Bengali bhadralok - which is what she is as often accused of by Left politicians - but because of her erratic temperament and lack of political farsightedness. However, she has proved to be very consistent in pursuing her one-point agenda of teaching the Left Front, more precisely the CPI(M), a lesson for its arrogance. In pursuing this agenda, she not only sounded the death-knell of Bengal Congress but also facilitated the entry of BJP into mainstream politics in Bengal. The trend that has been set in Bengal politics by both the ruling and opposition parties can be said to be one of crude pragmatism, devoid of any sense of propriety. If achieving power becomes the aim-in-itself, allowing any means for achieving it, politics degenerates to power-mongering. And that has happened in Bengal politics. Mamata Banerjee may be the crudest example, but the Left leaders do not lag far behind. The Bengal communists came to power accusing the Congress of ideological degeneration and power-mongering. Now they are in the same trap. Twenty-three years of power has robbed the communists of all of their ideological moorings. The Congress went through the same process and after 50 years they are now almost pushed out of the political arena of Bengal. Will communists follow them? Perhaps not before Jayoti Basu, the master pragmatist and the bhadralok icon, departs from the political arena.

Karnataka Electricity Reform Ordinance

Much Ado about Nothing

D K Subramanian
Vinod Vyasulu

Power generation and distribution has long been a state monopoly in India. State electricity boards have suffered from excessive and arbitrary government interference. They have run at a loss and have failed to meet the power needs of their consumers. Unbundling and privatisation have recently been discussed. The Karnataka Electricity Reform Ordinance is meant as a step in the direction of improving efficiency and transparency of operations. But it is not likely to solve the basic problems. It tinkers with form not substance.

THE governor of Karnataka has promulgated the Karnataka Electricity Reform Ordinance 1999 to bring about major changes in the way the power sector is organised in Karnataka. There has been a great deal of debate in recent years on the chronically crisis-ridden electric power situation in this state.¹ Why the route of an ordinance was chosen is not clear: what is the urgency? When a debate has been going on, it could as well have taken place in the assembly, and a law passed at the end of the debate. This would have enabled all stakeholders to put forward their concerns, and acceptable compromises could have been arrived at. This process would have avoided the impression that the government is trying to do something surreptitiously, and that would have helped in getting the co-operation of all concerned in accepting the major (and perhaps for many, painful) changes that are undoubtedly required. But the decision has been taken, and we have to move on.

This paper is organised as follows. The background to the current situation is provided in Section I as this is essential to understand the nature of the reform that is needed. Some comments are made on the ordinance recently promulgated in Karnataka in Section II. No effort is made to provide a summary of the ordinance – it is assumed the reader is familiar with it. The lessons to be learned from this episode are briefly discussed in Section III.

I Background

It is necessary to begin by remembering that the state electricity boards were set up several years ago with high hopes, and after careful study.² It was then felt that electric power is a crucial sector that must remain in the government domain for several reasons. For one, the electricity industry, it was believed, is a 'natural monopoly', where only the state can function effectively. Another reason was

the prevailing ideology of the time – the government must control the commanding heights of the economy. Electricity was undoubtedly part of the commanding heights. The third was the need to reap the economies of scale from a vertically integrated electricity industry, so that socially underprivileged sectors could be cross-subsidised. There could have been other reasons too. Thus generation of electric power (from non-atomic sources) and its distribution were kept in the same organisation at the state level. In this sense, the electricity boards were a vertically integrated unit in the same sense, for example, as Telco was. This was seen as a strength of the organisation to meet its social obligations.

The boards were to function free of day-to-day government control. That is why they were not set up as government departments, but given autonomy in many matters. They were to take commercial and business factors into account, and function accordingly. They were to give a modest return of 3 per cent to the government. If for any reason the government decided on subsidies, it was to reimburse the board in full. The board structure was considered flexible enough to ensure this. It was a well considered and well planned strategy.

Over time, in the mid-1970s, the union of India felt the need for expanding its role in this sector.³ This is not surprising, as the generation, transmission and distribution of electricity was seen as a function that the government had to discharge – there was no question of private sector participation.⁴ As a result, changes were made in the existing arrangements, and generation activity was also undertaken by central agencies – the National Thermal Power Corporation (NTPC) and the National Hydel Power Corporation (NHPC) being the two major organisations in this area. This led to a number of complexities in the working of the electricity

system. What if the bills of the central agencies were not paid by state boards?⁵

Experience has taught us that the boards have not done well. Before restructuring the boards, we must understand whether failure is attributable to the boards or to the government. Only if the reasons for failure were internal to the boards will a new organisational design help. When drawing up the new design, we must decide if the new system is to be an enabling one in which the new structure is free to evolve within a defined framework, or if it is to function within strict guidelines specified in the act. Our tendency in India is the latter – many things are spelled out in the law as passed. But this is not the best way to build institutions.

There are many reasons for the poor performance of the boards – and these could vary across the states. We focus here on Karnataka. This state had, effectively, separated generation and distribution of power. The KEB has been responsible for distribution, and the Karnataka Power Corporation (KPC) for generation. By and large, the KPC has been showing profits. The problem has been with the KEB, that is, with transmission and distribution.⁶ It is this that this ordinance is meant to solve. Except perhaps for disinvestment and consequent privatisation at a later date, the KPC is not the subject of this discussion. The regulatory body seems to be an add-on. The government of India has set up a Central Electricity Regulatory Authority (CERA), and it has advised the states to set up such a body. The government seems to have taken advantage of the ordinance to do this as well. The merits of setting up a regulator on its own, rather than as part of a KEB restructuring exercise, have not been discussed. If they had been, turf wars could have been avoided.

There has been opaqueness in functioning – information is not shared with the public and others interested. The organisation has become another government department,⁷ remote from consumers, dependent on decisions and funds from the state government, and yet supposedly responsible for results. That result has been serious disruption of the power sector – with consequent impacts on the state economy. It may be worthwhile to recall the experience of Bangalore industry with the Bidadi multi-fuel project in this connection.

Government was not only completely non-cooperative, it did not honour agreements entered into in good faith. This is not a promising base for future co-operation. Users of electricity too are so unhappy with the way they are treated by the KEB that they will support any move that is seen as cutting the board down to size.

There have been problems with staff – overstaffing, poor motivation, indiscipline, etc. The KEB has a large number of meter

readers, linemen, etc – far more than necessary. This is a problem of long standing. There have been problems of leadership, with generalist administrators rather than technical people heading the boards most of the time. There have been problems of attitude – the KEB has worked like any other government department: blind and unthinking adherence to outdated and irrelevant rules is the norm. It has become remote from the ordinary people, and has placed itself above them. There has been politicisation of the wrong sort. Decisions have been made outside the board and then rubber-stamped routinely.

A new design must, then, learn from all this experience. It must address the key problems and make a new start. We have to see if the model in the ordinance does so. There has been a change in technology during the past 30 years, we can now use sophisticated electronics and computer devices to monitor a system, connect a small generator to the system (this was not possible till a few years ago), meter the consumption of customers from a central place, control substations and generating stations, and regulate the system online for greater reliability and availability.

A community or organisation can have its own power plant at a lower cost of operation. The old theory of economies of scale is no longer valid. Also, due to heavy cross subsidies the cost of grid energy is more than that of self-generation for many organisations. This has led to large-scale localised decentralised power generation coming up in large numbers. Still there is a need for a centralised exchange to share the surplus energy of a given person at a given time to a needy person at that instance. A deregulated market is supposed to do this moving away from large power plants to a large number of small ones sharing their energy with others. The technology for small-scale power plants has also improved considerably and this has resulted in a large number of small plants coming up either for own use or for sales. Any new organisational set up should consider this aspect seriously.

When we have power supplied by various agencies like KEB, NTPC, Atomic Power Authority, Neyveli Lignite Corporation and many individual IPPs, it is necessary to evolve a common control strategy for load despatching so that we can meet the user's requirements without degradations. Load despatch with a common control strategy is the backbone of today's high quality power. This will dynamically state what should be the power generation at a given instant of time based on the load at that instant and will decide the power sharing amongst the many generating stations. This policy should be implemented by directly adjusting the

generation of each plant in the system. Any change in policy should take into account the role of load despatching also. We have the southern regional electricity board doing this job in conjunction with the state electricity board's load despatch centres. A provision for this is necessary.

II Ordinance 1999

On a first reading, the design created in the ordinance is impressive. It conforms to the insights of economists from industrial organisation theory. It seeks to create a distance between the business of running the power sector and issues of governance. It recognises the needs of consumers, and provides for them. It stresses the importance of competition. All this is most positive.

The ordinance goes into a lot of detail – it is 63 pages long. Thus, the idea is to foresee as many situations that are likely to arise as possible and provide for them in the law itself. This is not enabling legislation that permits evolution to take place within a defined and acceptable framework. It is a law that expects work to be done within a clearly defined framework. This is a negative feature.

We have to ask, though, whether a 'good' design is enough to make an organisation perform. If so, why did the electricity boards fail? Their design was undoubtedly good. One reason for this lies in the clause that permits the state government to 'issue directives' to the board. These directives cannot be rejected by the boards. Given that the boards were often headed by civil servants whose career path had no link with the performance of the board, there was little resistance in the past to accepting such directives. Often, a formal directive was not even necessary, a phone call would do.⁸ And these directives are outside the scrutiny of any agency – the government, it is assumed, is always right. The exercise of this near 'divine' right has led in large measure to the present crisis in the boards.

The ordinance contains this clause. We quote from Part-IV on the 'Powers of the State Government', Section 12: "(1) The state government shall have the power to issue policy directives on matters concerning electricity in the state including the overall planning and co-ordination." The use of the word 'shall' is emphatic. The act does not define terms such as 'policy', 'overall planning' and 'co-ordination'. Are the tariffs charged to different classes of consumers matters of policy? In the disputes that followed the recommendations of the Telephone Authority of India in April 1999, this was indeed the case.⁹ The government of India issued directives to the TRAI that many felt were uncalled for. This is more than likely to

happen when power is worded in such a vague way.

If the exercise of arbitrary power in the past via directives is the cause of financial and other crises, how can we expect things to be different because we now have a commission instead of a board? This is a question that the ordinance fails to answer.

A regulator is a creature of the legislative branch of government, and not of the executive. The government of Karnataka, headed by the chief minister, is the executive branch of the state. The regulator, as a creature of the legislature, has to serve as a watchdog, not only on the various players in the power sector, but also on the government which is a major player in this sector. The regulator must directly submit its requirements of funds to the assembly, which should approve them, with necessary modifications after debate on the work to be done by the regulator. The regulator must submit an annual report directly to the speaker of the house. The ministry should not be the channel through which the regulator approaches the house. And the funds of the regulator must not be treated as a 'charged' item [clause 8(4)] on which there is no debate. The chief minister should not be the 'boss' of the regulator, if the regulator is to perform. This is essential.

If directives become necessary – and that is a moot point – they must be given by the legislature that creates the watchdog, not the agency being watched. This clause is a way by which a creature of the legislative branch is subordinated to the executive – ironically, with the sanction of the legislature, for it passes the law. But the anomaly remains. This clause enables the executive to bypass the legislature. The fact that funds also come through the government makes the commission more vulnerable.

This clause gives one player power the others lack – it creates a conflict of interest that must be avoided, if we wish to learn from the past. The point is not that the government of Karnataka has no role in making policies in the power sector. The point is that the policy role must be distinct from the operational role. If the same agency decides both, we have confusion as experience in this and other sectors tells us. The policy context must be clearly defined and laid out. The limits of policy must be made clear.

It is therefore necessary to define policy clearly, and vest this policy-making power with the executive branch of the state government. The regulator must be given total freedom (within the framework of the law) in its domain. Its budget must be approved directly by the state assembly, and not routed via the ministry of energy. A system for this has to be set up, but this issue has not been addressed at all. This

can be done by defining its duties clearly, and by ensuring that an appeal to the courts is open to those aggrieved. The GoK must be kept at a distance. This clause must be dropped when the assembly considers this ordinance.

Why should the commission be limited to three members? Can all the specialisations required for it to function be found in three people? Is it not better to prescribe a range, say, between seven and eleven members? Why should the act worry about their *inter se* seniority? If the commission cannot deal with these matters, we are starting on the wrong foot. This only shows the bureaucratic mind-set of those who have drafted this ordinance. It will pervade the agency from the members downward. Is that what we need? How are consumers to be represented? Should not one member represent their interests directly? There should be a more diverse commission. This matter should be reviewed on the basis of larger debate.

The proposed advisory council cannot take the place of skills being available within the regulatory commission. It is at best a forum where the commission can elicit views and opinions. The experience of such advisory committees in other agencies should be looked at before reposing much faith in their efficacy.

Who appoints the members of the commission? It set is to be the government. Is this an unfettered power? Should not the government's nominations be ratified by the assembly? Should not the speaker issue the appointment letters? After all, the regulator is a creature of the assembly, not of the executive. Is the method of selection open? Should not the process be subject to a 'sunshine' law? Should it not be incumbent on the candidates to meet with the different constituencies their decisions will affect, and answer their questions? In the US, any candidate for president of a university in Florida must meet such groups and answer their questions. These groups then give their inputs to the search committee. This is not an affront on anyone's dignity. It is a transparent process, and it will make it easier for different groups to accept unpleasant decisions that such a regulator will have to take.

Should not the selection committee be appointed for a fixed term? The ordinance simply says it shall constitute a selection committee. If the chairman is a retired judge of the Supreme Court surely he/she can handle this responsibility. Clause 57 repeats the power of government in this regard. Clause 57(2)a says that "the procedure to be adopted by the selection committee for the discharge of the functions under the ordinance" may be given by the government. This is a case of overkill. It is as if a committee headed by

a retired judge cannot be trusted. This is a good indicator of the mind-set of the government of Karnataka.

Why should the government decide the remuneration of the members? Why should conditions of service be "as may be prescribed" (clause 6.2)? Prescribed by whom? The bureaucracy? Why? Is it to ensure that persons with high qualifications and experience outside government find this position unattractive? Should this not be left to the selection committee to settle? Does the government have so little confidence in this committee?

Why should the members take an oath of office and secrecy (clause (6.3))? What is the secrecy involved? Is it not the idea that the commission introduce transparency¹⁰ into the operations of this sector? Should the members be fettered from sharing information by such an oath? Who decides what is 'secret'? People holding such high office must be trusted, and if at fault, they must be prosecuted under proper laws. Such arbitrary muzzling must be opposed. This clause must be removed.

Part III, on the proceedings and functions of the commission, does not mention any research – perhaps because our government does not believe in it. For such a commission to do its work, it is essential that it liaise closely with research institutions in and outside the state. It must have access to recent advances in knowledge, not depend on the bureaucracy for such information. It must have some research competence within itself. It is essential to add explicitly that the commission, as part of its proceedings, will interact with research agencies of all kinds. It must have the power, and funds, to sponsor research in areas it considers important. This is an important lacuna in the ordinance.

The functions of the commission must include a clause that empowers it to encourage conservation of energy. It must support measures that lead to greater efficiency in the use of devices that use energy. Demand side management is important. This can be done by focusing on the services that consume energy, and by supporting efficiency improvements in such services in all ways. For example, the use of CFL lamps in place of the common light bulb must be encouraged. The ordinance is silent on this important matter (Section 11). That may mean this issue gets no attention at all, or worse, is treated as outside 'the terms of reference'.

There is one more area where confusion may prevail. The commission has the power to issue licences (clause 11e). Clause 19 discusses licences in detail. First, licences are only in transmission and supply or distribution (19.1). Clause 18(1) also refers to 'transmitting electricity' or to 'supplying electricity, including its bulk

supply'. What about retail supply and distribution? Things are not clear in this wordy document.

What are these licences for? Will the commission in its support of competition, limit licences as in the past regime of licence raj? Will the commission insist that a transmitting company transmit power from any generator who wishes it? Will it limit licences to one per area so that there is a local monopoly? There is no indication of whether this power will limit freedom of entry into these activities. There is no indication of the basis on which this power will be used. Given past experience of licence raj in India do we need licensing at all? Will not this power choke competition rather than encourage it? This is a major issue that merits debate.

It is, in our view, not desirable to mention amounts that the commission can impose as fines in the law itself – clause 42, for example, mentions amounts of money – a lakh for this, 20,000 for that. We know from experience that inflation makes nonsense such numbers. Why not leave it to the commission to decide in its wisdom – saying, perhaps, that at the time of passing the act, these amounts seem reasonable for such offences? If not, it will not be uncommon for an offender to pay the fine and continue to offend, because it is so much cheaper to do so. Look at the fines for contravening the provident fund provisions – today the fine amounts are trivial. Unscrupulous employers will find it legal to cheat employees, and pay a fine and do the same again. Such situations can and must be avoided. Perhaps an enabling provision for exemplary and strong punishment of wilful offenders would be a good idea.

What about the technical aspects? An important concern is the issue of load balancing. In peak hours, there may be no problem. But in off-peak hours, it may be necessary to back down some plants. Logically, these should be the high cost plants. But the power purchase agreements that are being signed with some private generating plants guarantee off-take at high levels of generation. In Maharashtra, the agreement with Enron implies that lower cost plants which belong to the MSEB will have to be backed down. This means lower efficiency, and higher costs for consumers. Two points need attention here. One, is there any reason to believe this will not happen in Karnataka? Two, does the regulator have access to all the information needed for such decisions? Will it be in a position to know what central plants are doing? If it has the information, can it impose its will? We have our doubts.

The ordinance is silent about load despatching. Who will do this job? Who will co-ordinate the instantaneous generations of several plants such that they meet the

load requirements and both frequency and voltages are maintained and the participating generating plants agree on the desired generation values? Load despatching is an important function in an electricity board and it encompasses generation and transmission. It should not lead to load shedding frequently due to lack of co-ordination. In what ways will the proposed Karnataka Power Transmission Corporation (KPTC) be different from the KEB? Clauses 14 and 15 deal with the reorganisation of the KEB. Assets and liabilities are to be transferred to the KPTC from the KEB. Apart from the legal requirements, Clause 15 transfers all employees to the KPTC. What will the KPTC do with so many meter readers and the like? Transmission is a capital intensive activity and without money it will pose problems. Distribution can change radically with the use of modern technology. It is, for example, not necessary to have meters (whether tamper proof or not) and meter readers any more, because the consumer's use of power can be 'read' from the sub-station. This is just the way telephone use is monitored for billing purposes. If the regulator wants to encourage the use of such equipment, can the KPTC, with its large staff, do so? Can the regulator reduce corruption in this way? Where will all of the meter readers go? Is the problem one of a 'board' design versus a 'corporation' design or is it more basic? Is it not the question of corruption and overstaffing that is the problem? How does the ordinance tackle this? All that is being done is change the name of the organisation leaving intact its problems.

Things could be worse. The new licensees are unlikely to employ all the KEB people. They will set up shop in a different way. Just as the new private banks operate with fewer people and high technology so will the new private power transmitters and distributors. In what way does this ordinance solve the basic problems of the ailing power sector? Is it not making things worse?

We have said enough to make our basic points. This law, in our view, should be briefer: it should enable the commission to function. It should have a larger number of members, and it should trust them to a greater extent. It should have independent funding from the assembly, and it should give a report directly to the assembly each year. It must support research. And the GoK should be kept away without a remote control in the form of directives it can issue. The structural problems confronting the KEB should be tackled honestly, not shifted in complex organisational re-creations. These, we would argue are necessary preconditions for the success of a regulator. We do not yet know if they are sufficient.

III Conclusion

Although the reasons for the plight of the KEB and the electricity sector have not been analysed in this paper, it is clear that the board has been suffering because of what the economists call the principal-agent problem. The board has been an agent of customers in its structure. Yet, customers, as principal, had little control on its decisions and actions and therefore board officials, as agents, have been taking decisions in their own interest. The whole picture is much more complicated because there have been a range of subagents as well. Government as 'owner' has been another principal. The system of 'directives' has facilitated their working at cross purposes with remote principals. In its working, not design, the system has been deficient.

The fact that the state had relatively healthy finances at the time, and that it was in a sense an agent of the civil service, also complicated the matter. The board was a nexus of several principals and multiple agents. Subsidies could be used to cover the consequences of various decisions that these agents took. The result was the mess the KEB found itself in over the years.

The new model in the ordinance does not tackle this problem. It tinkers with form, not substance immediately connected with electricity. The state is in the middle of a fiscal crisis, and any source of funds is welcome. There are possibilities of large loans for power from the World Bank. The state government would like to tap these funds. By means of this ordinance, it is getting into the queue.

The World Bank has clear views on the reforms it supports. But this may not be based on an understanding of the ground reality in Karnataka. But it insists on an 'unbundling' exercise and eventual privatisation of the sector. This has happened in Orissa.¹¹ Whatever the nature of the problem and the debate, the state government would like to make the changes that it thinks will improve its chances of getting a World Bank loan.

Electricity supply is a field in crisis for a number of reasons. It is difficult to make the changes that the structure demands. It is also possible to please the industry lobby by these kinds of changes because it would appear that rates for industry may come down or the supply position improve. With elections approaching, it is prudent to appear to be industry-friendly.

The reforms also enable the state government to abdicate its responsibilities without in any way surrendering power. If there are problems it can blame the regulator or the new corporations. But through the power to give directives, it can pander to its lobbies and feather its own

nest via 'jobs for the boys' policies and the like.

The approval of the ordinance in the house will solve none of the basic problems of the power sector. It will be passed because the government thinks that it will lead to loans. The crisis remains. It can only intensify further.

It is the underlying core of problems that need to be looked at and solved. The best thing that can happen to this ordinance is to let it lapse. The ordinance then would have served the laudable function of focusing attention on this important subject. Given the political situation that may well happen.

Notes

[An earlier draft was presented at a meeting of the energy committee of the Greater Mysore Chamber of Industry and revised in the light of the discussions there. S Krishna Kumar and R Sudarshan commented on an earlier draft, and we are grateful to them. Responsibility for errors and opinions is ours alone.]

- 1 Very detailed suggestions for reform have been made. See the DEFENDOUS Approach, *Economic and Political Weekly*.
- 2 Under the Electricity (Supply) Act, first passed in 1948, and amended many times since. Also relevant is the law passed in 1910.
- 3 Electricity is in the concurrent list in the Constitution, and both the union and states can pass laws. In the case of conflict, the union laws prevail.
- 4 There were a few private sector participants, as a result of historical accident. In Ahmedabad, Calcutta and Bombay. But they had little role to play in the growth of the sector.
- 5 There have been instances of such dues being deducted from the plan assistance a state was entitled to. This makes the matter immensely complicated. Clearly, solutions were long overdue.
- 6 In specific terms, the problem of transmission losses which are basically those of power theft, and of free supply to some sectors like agriculture. We may note that the agriculture sector as a result gets very poor quality power, and this leads to a vicious cycle of inefficiency.
- 7 This suggests that the problem is a deep rooted one not unique to power. If this is true basic reforms in government structure will need to precede electricity sector reforms. That is a separate question altogether.
- 8 This is of course not true of everyone. There have been many who tried to keep an independent position. But if they were in a majority, we would not be in this plight today.
- 9 Discussed in D K Subramanian and Vinod Vyasulu, 'The FRA hubbub', May 1999, unpublished.
- 10 One of the reasons for 'unbundling' a complex organisation is to improve transparency. But while the reform efforts may start with such laudable motives, when it comes to drafting laws and regulations, this kind of opaqueness is often built in. This is not the first time this is happening.
- 11 There are many differences between Orissa and Karnataka. In Orissa, farmers have always paid a minimum of 50 paise per unit for power. It was never free. Further, power use in the agriculture sector was around 8 per cent of the total power produced. The situation in Karnataka is different. We have to ask if these facts are relevant in the context of the restructuring debate.

ASEAN and Regional Security

S P Seth

The question before ASEAN now is whether it should continue on its old course of mutual non-interference or re-energise itself through open political and economic debate among its member states even if it means scrutinising their internal affairs.

THE 10-member Association of South East Asian Nations (ASEAN) was under the microscope in Singapore at a recent annual meeting of its foreign ministers. The ASEAN, once held as a model for regional co-operation, has become increasingly irrelevant following the 1997 Asian economic crisis. All through this difficult period which is still not over, ASEAN was in hibernation. No one in the organisation could envisage a role for it of any kind. This is sad commentary because, not long ago, all big and small powers paid homage to its vitality and effectiveness. Many wanted to be associated with it through membership of its sister regional fora like the ASEAN Regional Forum (ARF), Asia Pacific Economic Co-operation (APEC) organisation and so on.

At its Singapore meeting, the question of how best to re-invent ASEAN was debated by some of its members. During its heyday, the organisation projected an image of regional solidarity based on the principle of mutual non-interference. The question now is whether ASEAN should continue on its old course or re-energise itself through open political and economic debate among its member states, even if it meant questioning and criticising their internal affairs.

Thailand, backed by the Philippines, is a proponent of the reformist line. According to Surin Pitsuwan, Thailand's foreign minister, there is an imperative need to re-invent ASEAN in a more relevant role. As he told the Singapore meeting, "Concerns and doubts have been raised about the standing of ASEAN as a regional organisation and its ability to play a leading role in the international arena". Which led him to pose the question: "Are we tigers ascendant, an integral part of a new Pacific century, or are we last year's wounded cubs, transposed and forgotten?" And he had no doubt that ASEAN would need to reinvent itself on a platform of openness, greater regional economic integration and trade liberalisation.

Malaysia, though, still upholds the old view of maintaining regional solidarity and unity based on mutual non-interference. According to its foreign minister, this has stood the organisation in good stead in terms of ensuring regional peace, stability, and nation-building. He believed that ASEAN was being undermined by 'selective criticism and vilification' by foreigners in the wake of Asian economic crisis. They wanted it "to discard its *modus operandi*" based on "the principles of non-interference in the internal affairs of one another..." He, therefore, urged his colleagues to "pause and carefully think through the options available to us. We should not accept those which are alien to our national psyche and hurtful to our national objectives."

Nothing was, of course, resolved at Singapore. The ASEAN, therefore, is now at a standstill and hence irrelevant, which is a pity because the organisation has an even more important role to play at a time when Asia-Pacific region is showing considerable volatility. For instance, it could play a useful role in moderating/defusing growing tensions from competing sovereignty claims over the Spratly chain of islands in the South China Sea. China and the Philippines are already feuding over some permanent structures built by the former over a reef they both claim. Now Malaysia has joined the fray with the Philippines, having erected a structure on a reef claimed by Manila. China, in any case, claims sovereignty over all of South China Sea, with all its islands and territorial waters.

One way of dealing with this situation is an agreed code of conduct to manage the intractable question of sovereignty over the Spratly islands. The ARF, an expanded forum for discussing regional security issues, however, failed to adopt such a code at its Singapore meeting. The question has been referred to a special working group. Australia fears that a weak code, even if adopted subsequently, will not be adequate to deal with

recurring tensions in South China Sea. Canberra reportedly favours a code with a moratorium on the current race to occupy disputed reefs and/or build structures on them. But, with ASEAN hardly pulling any regional weight now, South China Sea tensions are unlikely to simmer down.

Similarly, ASEAN and ARF are unable to play any role in other regional crises. ASEAN was once considered a potential regional counterweight to China. But, at present time, when China is threatening Taiwan, ASEAN and ARF are mute spectators. When China's foreign minister recently said in Singapore that there should be mutual respect in the region, instead of the 'strong bullying the weak' (alluding to US support of Taiwan's defence), the irony of it was lost on everyone in the face of China bullying Taiwan. In the same way, ARF has virtually no role to play on the Korean question. Recently, there were two naval incidents involving North Korean ships, chased and sunk by the Japanese and South Korean navies respectively. Both had the potential of getting out of control to create a regional security crisis. There is no regional conflict-resolution mechanism in place (apart from ARF which, in any case, is ineffective) to defuse such dangerous situations.

A tense situation is also developing from North Korea's likely test launch of a long-range missile, believed to have a range of 3,500 km or more. Japan, South Korea and the US are pretty uncomfortable about it. Their diplomacy and threats do not seem to be working with Pyongyang. Japan's white paper on defence pretty much captures the mood when it says, "North Korea's missile development, coupled with suspicion over its nuclear weapons development, is a serious concern which is becoming a destabilising factor not only for the Asia-Pacific region, but for the entire world".

It is not that a stronger ASEAN and ARF would have resolved regional problems. But there was hope that ARF might over time develop into a regional structure for conflict management/resolution. But with ASEAN now weak, divided and irrelevant, that promise doesn't look like materialising. And the Asia-Pacific region is developing into a region of multiple flashpoints, any one of which might blow up with dire consequences regionally and globally.

Wildlife Protection and People's Livelihood

Building Bridges

The 'Third National Consultation on Wildlife Conservation and People's Livelihood Rights' was a dialogue between those advocating the cause of wildlife and those struggling to uphold the human rights of communities living in and around wildlife. A report.

OVER the last few years, conflicts have erupted in many of India's national parks and sanctuaries and other wildlife areas, between officials and NGOs involved with wildlife conservation on the one hand and local communities and social activists on the other. A top down model of conservation, which has ignored the dependence and rights of local communities on the resources of natural habitats as also their traditions of conservation, is one of the main causes of this conflict. Other factors include the increasing politicisation and commercialisation of rural areas, breakdown of traditions, and demands made by the growing human and livestock populations. Simultaneously, wildlife and wildlife habitats, and the resource base of countless rural and tribal communities, continue to be destroyed by the dominant industrial/commercial economy and the rampant consumerism of a rich minority. The same governments that declared protected areas (PAs) (national parks and sanctuaries), have today neither the will nor the means to protect these areas. On the contrary these very areas are being thrown open for activities like mining, dams, industries, tourism, roads and other so-called 'developmental' projects.

A series of consultations, local to national in scope, has been attempting to reduce the differences between positions taken by the conservationists and social activists; in essence, to build bridges. In particular, the common interest of these groups to counteract the powerful industrial and commercial pressures mentioned above, has drawn them together. An attempt has been made to build on this common ground for greater understanding and joint action.

The basic understanding with which these dialogues are being held is that, for all participants, the aims of wildlife conservation and that of ensuring the livelihood security of people living in and

around wildlife habitats, are fundamentally critical.

Participants at the third consultation reiterated the principles that were laid out in the first and second consultations. In particular, the following were reinforced:

(1) The fundamental right to existence of all wild animals and plants, and the need for protected areas and legal measures to ensure this right.

(2) The fundamental right of local communities to the survival and livelihood resources which they have traditionally enjoyed, and to participate equitably in conservation programmes.

(3) The need for the full protection of threatened wildlife species across the country, for which certain inviolate zones (demarcated in a participatory manner) may be necessary.

(4) The unacceptability of forced displacement of traditional communities from protected areas or other habitats.

Commercial and Development Threats

It was recognised that the major threat facing India's wildlife habitats and the livelihood interests of a majority of local communities, came from a rampant 'developmental' process which was encouraging the industrialisation and commercialisation of even ecologically and culturally sensitive areas.

Mining: Concern was expressed at the rapidly expanding scale and magnitude of the mining industry, especially in the new economic climate where mining is being made easier and more lucrative. At least 40 protected areas, and innumerable areas outside of these, were under threat. In addition, it was reported that the ministry of mines and steel was attempting to dilute even the existing environmental regulations governing mining, and to change the Mines Act to make mining permissions much easier. Participants expressed a need to study the specific impacts of mining in

PAs and other wildlife habitats, and obtain a nationwide picture of this. A format for information gathering was circulated by Kalpavriksh. A joint statement was issued by the participants, protesting the spread of mining in ecologically and culturally sensitive areas, objecting to the ministry of mines move to dilute environmental regulations, and strongly recommending that mining policy and Mining and Minerals Act should be amended to keep ecologically and culturally sensitive zones like protected areas and scheduled areas completely inviolate.

Recommendations:

(1) Investigations into the impacts of mining should be carried out in specific PAs and other wildlife habitats.

(2) A national level study should be undertaken to get a comprehensive picture of mining in PAs and other wildlife habitats, and to build a database of people working on this issue.

(3) Moves to dilute the current environmental regulations on mining, including those of public hearing and restrictions in and around ecologically sensitive areas, should be opposed.

(4) Mining policy and legislation should be amended to make ecologically and culturally sensitive areas off-limits to mining.

(5) The committee set up by the ministry of mines should be asked to provide a hearing to the participants of the consultation.

Tourism: The meeting stressed that conservation and not tourism promotion or revenue generation is the main aim of PAs and other wildlife habitats. Participants recounted many instances of tourism induced violation of local community rights (including alienation of tribal lands) and wildlife conservation principles. Whereas some of the participants were in principle completely opposed to tourism in ecologically and culturally sensitive areas, others were of the opinion that it can be beneficial in terms of sensitising people.

Recommendations:

(1) Tourism should be planned with the full involvement and consent of the local communities.

(2) A substantial portion of the revenue earned from wildlife tourism should go to local communities and to the management of the park.

(3) A strict environmental and social code of conduct should be formulated and enforced.

(4) Tourist resorts around protected areas, and tour operators, should be charged a

conservation tax that should be put back into conservation and the management of the PA.

(5) Comprehensive studies are needed to assess the ecological and social impacts of tourism in PAs across the country; where already available, these studies need to be collated and analysed.

(6) Wildlife tourism should be diversified, to areas where there is currently no focus, and to subject matters other than large mammals like the tiger, to enable a reduction in pressure on a few PAs.

(7) The 'tiger show' in places like Kanha Tiger Reserve and Bandhavgarh National Park (Madhya Pradesh) should be immediately stopped, as it is disruptive to wildlife.

Railways and highways: There have been many cases of wild animals being killed by speeding trains in places where railway lines pass through protected areas and other important wildlife habitats. Examples cited were Rajaji and Dudhwa National Parks in Uttar Pradesh (railways) and Sariska Tiger Reserve in Rajasthan (highways). Participants expressed serious concern about this, and about proposed highways in other areas (e.g., Namdapha Tiger Reserve, West Bengal, and Bhimashankar Sanctuary, Maharashtra). Simultaneously the expansion of the rail and road network across the country has increased access to resource rich areas, facilitating wider exploitation of the resources and also providing channels for illegal trade in timber and wild animals. Nor in many cases do they directly benefit the local communities in such areas. Examples such as Sariska Tiger Reserve, where a decision has been taken to divert a stretch of the highway that was to have gone through the reserve, are worth emulating. A joint statement was issued by the participants, to the union minister of railways, expressing concern about the death of wild elephants by speeding trains in Rajaji National Park in Uttar Pradesh, and urging appropriate action to eliminate future such incidents.

Recommendations:

- (1) Systematic site-specific documentation should be carried out, of damage to wildlife caused by roads and railways.
- (2) A national picture needs to be built up based on such documentation, to gauge the overall extent of the problem.
- (3) A series of measures should be tried out to eliminate or minimise the conflicts, such as diversion of tracks/roads wherever feasible, avoiding night trains and night traffic on highways within PAs and other

wildlife habitats, and reduction of speed in sensitive areas, and so on.

Poaching: Poaching continues to be a serious problem, to some extent within PAs, and especially so in wildlife habitats outside PAs. There is a need to clearly distinguish large-scale and organised poaching involved with wildlife trade (emanating largely outside local communities though often involving individual members of these communities), from cases where local people may kill wild animals to protect their lives, crops, livestock or property, or for food. Both kinds of hunting need to be tackled, but with different kinds of measures. Participants expressed the inability of both villagers and forest officials to tackle organised poaching, especially due to its connections with powerful people in and outside government. There was also concern about false cases of poaching which are often filed against villagers and activists, while the real poachers go scot-free in many instances. On the other hand, examples were mentioned of successful collaboration between forest officials and villagers, to curb poaching (e.g., at Tadoba National Park, Maharashtra).

Recommendations:

- (1) Joint anti-poaching measures should be initiated at the level of each PA, involving local people, forest officials and NGO representatives to tackle this problem. This will not only help in the detection of poaching cases, but also help to minimise false cases.
- (2) At the state level also, anti-poaching units (or, as in Madhya Pradesh, special protection cells for tiger and other endangered species), should involve concerned NGOs and community representatives.
- (3) Vacant posts within the forest department should be filled up on a priority basis, and additional manpower be generated through the involvement of local people and NGOs.

Settlement of Rights

Several million people are living inside India's PAs, or directly dependent on their resources in some way. The rights of these people have not been adequately recorded and settled, though the Wild Life (Protection) Act specifies that this is to be done. The settlement process is now on in full swing, following a ruling by the Supreme Court (SC) in 1997, on a case filed by WWF-India. The SC ordered all state governments to complete the process in one year.

The fallout of this order was a major topic of discussion at the consultation. There has been widespread misunderstanding, especially amongst local communities, that the proclamations issued by the district collectors in this process are eviction orders. There are also widespread reports that customary rights are not being properly recorded, and that lakhs of people may lose their access to natural resources if the relevant clauses of the Wild Life Act are narrowly interpreted. On the other hand, difficulties in settling rights have also led several collectors to recommend the denotification (or deletion) of substantial portions of PAs. The process has also become a front for the entry of various vested interests, such as mining and hydro electric power projects, e.g., in Great Himalayan National Park, Himachal Pradesh, an area is sought to be taken out from the park ostensibly to avoid having to displace two villages, but actually to make way for a proposed hydroelectricity project.

P K Mishra, CWLW of MP, clarified that the settlement of rights process is not a process of eviction. He reported that Rs 1,500 crore would be required by Madhya Pradesh alone if everyone was to be resettled, and this kind of money was not available with the department. He reiterated that the settlement would be done in the interests of local communities. Kalpavriksh circulated a format to enable groups/individuals to systematically document the process of settlement as it is taking place in specific PAs.

Recommendations:

- (1) A national level documentation of the process of settlements of rights and its impacts on wildlife habitats and on local people, should be carried out.
- (2) Detailed guidelines should be drawn up for the conduct of the process of settlement of rights, so that denotifications/deletions can be minimised, and the customary rights of people can be properly recorded and established.
- (3) There should be acknowledgment of both recorded as well as unrecorded customary rights in this process.
- (4) The forest department and district administration should be asked to issue a clarification in each PA, in the local language, stating that the settlement process is not a process of displacement.

Displacement

Though it is considerably reduced now, participants expressed concern that dis-

placement of people from PAs is continuing in some areas. Though various agencies like the central government, the state governments and Project Tiger authorities have categorically stated that there will be no forced displacement of people from PAs, there is often induced displacement because of the denial of access to basic livelihood resources in these areas. Participants felt that this was not justified. Several participants asked whether any displacement was necessary at all, if a model of conservation that integrates human needs can be worked out. Other participants felt that in some cases, where there was an inevitable clash between the survival of a species or unique habitat and the continued existence of human settlements, resettlement may be necessary. In addition, what would happen once the population of the villages inside PAs grows beyond the carrying capacity of the PA? In this connection many participants pointed to the lack of a national policy on resettlement and rehabilitation (R and D), with regard to PAs. They also stressed that the recent scheme initiated by the ministry of social justice and empowerment, on this subject, was thoroughly inadequate.

Recommendations:

- (1) It was felt that displacement must be minimised, completely avoiding it as far as possible. Where considered necessary (the process for consideration of what is 'necessary' itself being participatory), it must be done with a comprehensive R and D package which is designed with the affected populations and involves NGOs and independent experts.
- (2) There was also a need to urgently clarify the difference between forced, induced, and voluntary displacement, and to lobby the government to accept these distinctions. A true test of whether R and D is voluntary needs to be worked out. NGOs and social activists should present a detailed definition of what 'voluntary resettlement' would mean.

State Forestry Projects

Many participants expressed concern that the World Bank aided state forestry projects, are leading to commercialisation and privatisation of forests, resulting in loss to local livelihood security and to biodiversity. The example focused upon was the Madhya Pradesh Forestry Project, studied in-depth by Ekta Parishad and the Kisan Adivasi Sanghatana. Concern was also expressed that forest departments are not capable of handling the large sums of

money that are made available in such projects. The projects have also resulted in an increase of social tensions.

Alternative processes for conserving forests which involve people and avoid the need for large-scale external funding, need to be explored. This includes a co-ordination of various government departments working in any given area, so that their resources could be pooled together to achieve conservation and livelihoods security. This has been done occasionally, for instance in the case of the Melghat Tiger Reserve in the early 1990s.

Recommendations:

- (1) Forestry projects such as the Madhya Pradesh Forestry Project should be opposed in their current form; future planning for forest conservation and use projects should centrally involve local communities and concerned NGOs.
- (2) State governments must ensure better co-ordination amongst various sectors of the government, so that available resources can be pooled together to ensure conservation and livelihood security.

Laws and Policies

Existing laws and policies relating to wildlife and forests have helped in the conservation of habitats and wild animals, and have to a certain extent kept out destructive forces which would have threatened wildlife as well as traditional communities. However, participants felt that these laws and policies have not been conducive to the involvement of local people and the continuation of traditional rights, and have in many cases further alienated local communities from conservation. They have also often been misused to authorise serious repression of local people. Finally, various laws and policies relating to natural resources have been conflicting with each other; in particular, those relating to the industrial/commercial use of resources have undermined those relating to conservation and sustainable use.

There have been a series of interesting initiatives in the last couple of years, some of them attempting to resolve conflicts between wildlife conservation and local community rights. These include:

- (1) A draft new Wild Life (Protection) Act, recommended by a central government committee, which strengthens wildlife habitat protection against commercial/industrial forces, but only makes some token changes in the current act's inability to involve local communities and provide

for livelihood rights; it provides for two new categories of PAs, including community reserves, but these will not be applied to existing PAs.

- (2) A central committee to rationalise the boundaries of protected areas, to minimise their arbitrariness and make them ecologically more logical.

- (3) A draft law on biological diversity, which provides for substantial involvement of local communities in conservation, sustainable use, and equitable benefit-sharing.

- (4) The panchayat legislation, in particular the Panchayat (Extension to Scheduled Areas) Act 1996, which potentially provides for substantial powers of decision-making to local communities.

- (5) A central committee to redraft the National Wildlife Action Plan (1983), for the next 25 years; the draft under formulation contains a new chapter on people's participation in conservation.

Recommendations:

- (1) Appropriate changes in law and policy need to be made, which will prohibit commercial/industrial destruction of wildlife habitats, and facilitate the joint management of these habitats by local communities and government agencies. The draft new Wild Life Act needs substantial additional provisions for this, including the recognition of customary rights and the creation of joint planning boards for each PA.

- (2) The committee that has been set up to look into the rationalisation of PA boundaries needs to be more participatory, involving various sectors in its deliberations; in addition, it should not hurry through its work, as the task is complex and vast.

- (3) Various laws and policies, dealing with natural resources, need to be harmonised to strengthen conservation and livelihood security.

- (4) There should be state-level policies and action plans on achieving conservation and livelihood security, which can focus more on the peculiarities of each state, and can involve a wide range of sectors.

- (5) Much more clarity is needed in the relationship between the panchayat legislation and the laws relating to wildlife and forests; in particular, the move by some states (Maharashtra, Madhya Pradesh) to exclude PAs from the purview of panchayat legislation should be reviewed.

- (6) Each state should set up forums for regular (at least once or twice a year)

discussion of various issues related to wildlife conservation and people's livelihood rights, where local communities, NGOs, wildlife specialists, and government officials can interact in an atmosphere of openness and equality.

(7) New categories of PAs, as proposed in the draft new Wild Life Act, should be applied to existing PAs also, wherever appropriate.

Damage by Wild Animals

Several participants, in particular those from local communities, expressed concern about the increasing incidents of livestock lifting and crop damage by wild animals. This is true for both PAs and areas outside. In particular, wild boar related damage was repeatedly mentioned. Measures to reduce such damage were discussed, including those being tried out by communities and those studied by the Wildlife Institute of India.

Concern was also expressed at the thoroughly inadequate rates for compensation for such damage, and the burdensome process of obtaining such compensation.

Participants felt that if these issues were not tackled seriously, public support for wildlife conservation would decline even more. NGO efforts such as the WWF Tiger Conservation Project's immediate compensation scheme were put forward as possible models.

Recommendations:

(1) There should be a nationwide survey of animal-related damage, in particular due to wild boar, and of measures that are being attempted against this.

(2) Rates of compensation must be immediately increased, to make them equivalent to the market rate of livestock/crop damaged; and the process of compensation must be speeded up and simplified.

Conclusion

There is an urgent need for a new model of conservation that involves local people in the planning, management, and monitoring of wildlife habitats, including protected areas. Such a model would have to ensure the livelihood security of local communities and the conservation of natural resources and wildlife, by integrat-

ing traditional and modern ecological knowledge, ensuring customary rights and responsibilities over natural resources, strengthening village-level institutions and capacities, co-ordinating various government-level departments, and formulating enabling laws and policies. Regular forums of dialogue, from each site up to state and national levels, are urgently required to enable resolution of conflicts and framing of joint projects and processes.

In conclusion, participants reiterated the need for an active network of individuals and groups to push the above objectives. This was tentatively titled the Conservation and Livelihoods Network, and it was decided that Kalpavriksh would serve as the hub to start with.

[This is an edited version of the joint statement and recommendations issued by the 'Third National Consultation on Wildlife Conservation and People's Livelihood Rights', Bhopal, May 1-3, 1999. A group of about 50 wildlife conservationists, social activists, government officials, villagers, lawyers, researchers, and media-persons attended. The consultation was called by Kalpavriksh, Ekta Parishad, and Tarun Bharat Sangh and was hosted by the Ekta Parishad.]

The Yearbook of South Asian Languages and Linguistics is designed to be an international forum for the exchange of ideas amongst South Asian linguists. It brings together empirical and theoretical research and serves as a testing ground for the articulation of new ideas and approaches which may be grounded in a study of South Asian languages but which have universal applicability.

THE YEARBOOK OF SOUTH ASIAN LANGUAGES AND LINGUISTICS, 1999

Chief Editor: **RAJENDRA SINGH**

The invited contributors to the second **Yearbook** include two of the world's most distinguished contemporary linguists. Dressler, with his co-author, revisits the classical problem of aspirate formation in Middle Indic, while Kelkar, in his inimitable style, invites linguists to get to know Bhartrhari, whose restoration is long overdue. The languages covered by the open submissions include Bangla, Maithili and Tamil. Other features include the Reports section, Review section and a new Dialogue section.

1999 • 292 pages • Rs 550 (cloth)

THE YEARBOOK OF SOUTH ASIAN LANGUAGES AND LINGUISTICS, 1998

Chief Editor: **RAJENDRA SINGH**

Provides new insights into some significant aspects of Indian languages as examined by modern linguistic researchers. It owes its intrinsic merit to excellent reviews on phonology, morphology and semiotics in the context of some important Indian languages. No less significant are the abstracts of valuable papers. Reports on linguistics researches in Africa, Europe, Japan, North America and Southeast Asia provided enrich the contents of the volume.

Building International Institutions to Avert Crises

Ashima Goyal

International Finance and Developing Countries in a Year of Crisis: 1997 Discussions at the United Nations edited by Barry Herman and Krishnan Sharma; Vistaar Publications, New Delhi and United Nations University Press, New York; pp 143 + x.

THIS book gives interesting insights into both the problems and potential of international dialogue. The nineties have been the era of globalisation; adopting acceptable international norms has therefore acquired a new urgency in a number of areas, including environment and trade. But most of all, with respect to mobile international capital. For such a dialogue to be successful, participants must of course reflect the interests of their constituencies, but they must also be ready to aid in the discovery of the small subset of rules that are acceptable to all, and that suit new circumstances.

The book is based on the presentations made by invited experts to a committee appointed to report to the United Nations general assembly on 'financing for development'. Since the meeting took place at the end of 1997, the south-east Asian crisis dominated the discussions. The book begins with an overview and a contribution by the editors who belong to the UN. Other chapters are by Oscar de Rojas, Venezuelan ambassador to the UN and chairman of the committee; Michel Camdessus, the managing director of the IMF; Ariel Buira, member of the board of governors of the Banco de Mexico; Linda Lim of the University of Michigan Business School; Arjun Sengupta, member of the Indian Planning Commission; and Gerald Helleiner of the University of Toronto.

The deliberations had an ideal mix: academics, representatives of developing countries and international agencies. Were they able to present and successfully sift their differing perspectives, in the context of the worsening situation in south-east Asia? There are two problems that can arise in such distilling of dialogue. The first is that the view of the more powerful may prevail and the second that only innocuous generalities may survive the process of consensus building.

All parties reiterate the potential benefits of foreign inflows as a source of finance

for development, but agree that both better domestic policies and new international norms are required to make such inflows safer and to raise their productivity. Sengupta notes that now it is possible for private finance to supplement official, even in areas such as infrastructure, and leveraging ODA with private external finance may help bring additional resources to low income countries in Africa that private capital normally ignores.

But what are the differences in positions? The IMF would like 'sound' macro-economic policies that will ensure the safety of international capital and minimise the contagion risk for neighbours. According to Camdessus, countries should not aim to pursue 'unsustainable high growth'. Developing country representatives, on the other hand, point to the danger from the demonstrated herd mentality and volatility of short-term global capital, and would like special borrowing facilities to be made available in times of crisis. The first view is that of the stern patriarch – help yourself first if you want us to help you. Punishment, it is believed, is essential to force the restructuring which is the only way out of a crisis. The second view points out that support and encouragement are required to brave the turbulence of international financial waters. Foreign capital must also share in any punishment, and tax and other measures that would decrease its volatility must be allowed. Debt-equity swaps or write-offs should be facilitated where necessary.

The dialogue in the book occurred at a very early stage in the crisis. How have events validated the positions taken?

It is now widely agreed that the traditional fiscal and monetary tightening imposed by the IMF in the initial stages of the south-east Asian crisis lead to an aggravation. The punishment was excessive and debilitating. It weeded out the weak,

but also made the healthy sick as contractionary policies turned illiquidity into insolvency. What are the correct policies, what are the constituents of good fundamentals, and when does high growth become unsustainable is not so obvious.

These countries had followed very conservative macro-economic policies, and could not be blamed on that account. But a modified form of the patriarchal view has still dominated since the general consensus seems to be that the countries themselves were to blame. Their banks and financial institutions did not follow modern practices, with regard to the regulation, supervision and disclosure of information. Linda Lim underlines this aspect.

But the more serious issue is that while conservative macro policies did worsen the crisis, they may have contributed to its inception. It is not sufficiently recognised that the conservative monetary policies followed by these countries may have partly caused the crisis. Since nominal exchange rates were largely fixed and monetary policies tight, domestic interest rates exceeded international so that domestic financial institutions had an incentive to overborrow abroad. The high ratios of short-term foreign debt played a major role in the cumulative collapse. Since the large gap between domestic and foreign interest rates arose in a regime of large capital inflows, a depreciation of exchange rates was considered to be unlikely. This created the incentive for large borrowing and resulted in high gearing. These countries have been blamed for not creating all the institutions required for markets to thrive, but the market-supporting macro policies they were following fundamentally distorted incentives to borrow. Allowing markets to determine the exchange rate would not have helped, because, in the context of large capital inflows it would only have appreciated, and lead to an even higher expected future depreciation to equate short-term domestic to foreign interest rates, under a tight monetary policy. Sound macro-economic policies are required, but sound policy has to be more context sensitive.

Although the patriarchal view has dominated in analysis of causality, the rapid recurrence and severity of financial crises, have the potential to hurt the patriarch also. Therefore international organisations have also become more open to

the 'soft' view in considering future reform. Ideas of lowering the mobility of short-term international financial capital; forcing it to share in the costs of adjustment; creating special financing facilities; greater transparency and accountability for international institutions; lower domestic interest rates and managed exchange rates are gaining acceptance. But there is a worry that resorting to a special facility will signal weak fundamentals, and precipitate a cumulative crisis, much as the large devaluations undertaken in south-east Asia actually provoked a greater outflow by signalling problems. Therefore, as Buirra argues, special financing facilities are required before and not after a crisis.

In 1999 south-east Asian countries are beginning to recover. South Korea is expected to grow at 2 per cent and Thailand at 1 per cent. They are following the V-shape observed after the Mexican crisis of 1994, although the recovery is less rapid because of the initial aggravation and widespread contagion. The V-shape was not observed in the Latin American crisis of the eighties, partly because it took much longer to negotiate rescue packages. The international community has learnt from the crises since recovery has been faster in the nineties compared to the eighties. But it can be argued that there is a moral hazard in rescue packages. The signal of Mexico to the investing community was that they would be bailed out by the IMF, and this may have made them careless in lending and been part cause of the south-east Asian crisis. Therefore attention has to turn to measures of prevention in the light of experience. While recovery is faster the frequency of crises has also become greater – this is the circumstance that may force the powerful to share in penalties, so that the developing country view may be translated into policy.

The resolutions adopted by the 52nd session of the general assembly, based on the recommendations of the committee, and reported in an appendix, are an indication of this. They reflect Helleiner's position that increasing integration of developing countries raises risks to them but also to the world economic system. Therefore it is necessary to give them a larger voice in international institutions. Developing countries do have to restructure and adopt efficient financial practices, but international norms that make capital inflows safer are also necessary. And then perhaps the new mobility of global capital can help provide more funds for development and usher in a prosperous new century.

More detailed recommendations for institution building are required than are available in the book, but if past events lead to a softening of the patriarch

a win-win outcome is feasible. The 1997 discussions at the UN indicate a direction that continues to gather strength today.

Accountability in Defence Establishment

Gautam Navlakha

Arms Procurement Decision-Making, Volume 1: China, India, Israel, Japan, South Korea and Thailand edited by Ravindar Pal Singh; SIPRI, Oxford University Press, 1998.

FOR most non-experts writing on defence related matters, it is frustrating to first try to locate sources and then make sense out of inadequate information. Those who have access to official sources are hamstrung by their dependence on their sources to provide any critical or independent thinking. Very often it is crisis or scam that helps reveal the decision-making processes. This obliges one to tread carefully lest partial explanation results in biased understanding. The book under review has to be appreciated against this background.

There are six case studies organised around four major themes: military and politico-security issues; budget, financial planning, and audit issues; techno-industrial issues; and organisation behaviour and public interest issues. This is followed by comparative analysis. The underlying assumption in trying to understand "the barriers to the promotion of accountability" is to contribute to "arms procurement restraint" and eventually promote a "stable and durable peace". The book addresses the problem between the public's 'right to know' versus the government's 'need to know'. For us in India this debate has acquired a life and death meaning since the nuclear weapons test in May 1998. Not only was this decision taken by a coterie without strategic defence review before or after the explosion, but neither the cabinet nor the parliament was taken into confidence. And all this against the background that the ministry of defence turned down the request of the standing committee on defence for a written defence policy document. And yet since 1980-81 India's defence spending has been rising at a furious speed, and parliamentary control of the defence allocation has virtually non-existent. This underscores the importance of this study because it shows what the process is in each country, where they differ from each other, and the

inadquacies of the institutions in the six countries when it comes to exercising legislative control.

The six case studies are uneven, and not all provide answers to the questions posed by the study. For instance there is little information available on the very first issue which encompasses threat assessment and long-term planning. While China has prepared and published a white paper on defence in 1995 this excludes security concerns but provides manpower reductions, defence spending, military-industrial conversion, technology controls and arms control obligations. In contrast there is no written defence policy document available in India. Japan's threat assessments are influenced by the US through the new guidelines for US-Japan defence co-operation, signed in September 1977. While the US plays an equally important role vis-a-vis South Korea the recent decision of the South Korean government to reject the theatre missile defence offered by the US in contrast to its acceptance by Japan and Taiwan shows the different trajectories relations have taken. Significantly, the stance of South Korea on the US offer of TMS shows that there is an effort to restore civilian/legislative control over the military which has ruled South Korea for almost four out of five decades as well as that the government is committed to improving ties with North Korea much against the received wisdom of administrations in the US, Japan, and other busybodies. The study also shows that all the six countries provide an unitemised budget, that formulation of policy is the prerogative of the military and civilian bureaucracy, with varying equations between them but tilting in favour of the security establishment and the regime of secrecy (called euphemistically 'confidentiality').

Be it threat assessment, budget making or audit of expenditure, the problem is

rightly understood as a need for public accountability. But what institutional arrangement is required to reach this goal? How is this to be brought about when threat assessments are rarely, if at all, discussed, information asked for can be refused, data can be embellished, members of legislatures have no independent monitoring or access available to enable them to exercise control over government? Legal and constitutional provisions too do not help matters. For instance Article 9 of the Japanese constitution notwithstanding the budgetary allocations for 'self-defence forces' are stupendous at 1 per cent of GNP. The study lists various barriers to 'developing public accountability norms' but does not venture into delineating the requisite institutional set-up to reform this. For instance the study cautions against "excessive military autonomy in security policy-making and arms procurement decision-making". But this, it says, can be removed through better co-ordination between foreign and defence policies. This obviously implies that bureaucracies between themselves can sort out the differences and that improvement in the intestines of the security set-up would result in accountability. To reduce 'accountability' to mere 'co-ordination' between one branch and another is to rob the keyword of its meaning. In each case it is the security apparatus, i.e., military-civilian bureaucracy and intelligence that prepares the assessment. Once a draft is presented, the study reveals, there is little questioning of threat assessment or other assumptions to an extent where legislative oversight often becomes a mere formality to be gone through. As a suggestion, therefore, it is a non-starter because public accountability means legislatures can question, probe, scrutinise, modify, change, etc., the assessment, policy, and action-plan. In any case compared to the current paucity of information, any accretion in our understanding would go a long way to enhance public awareness and participation.

The book is dismissive of the role of the NPC in the case of China being able to influence defence decision-making. However, in none of the other five countries is the institutional mechanism sufficient to allow for transparency and accountability. The six reports highlight the absence of any input or feedback that people's representatives can make to security analysis, formulation of policy, allocation of budgetary resources, etc. The role of the security apparatus, in preparing threat assessment, etc, with

the control of inflow and outflow of information to the public denies the representatives a chance to pose questions or demand explanations over matters related to 'national security'. Nor do the legislatures have their own body of experts to check and cross-check or scrutinise and verify information. Indeed if we exclude China and India, then the rest of the four countries with their strategic relations with the US and dependence on the US for arms, to large degree suffer influences which fall outside legislative control. Not only do the threat assessments get coloured but even procurement policies get determined. Admittedly there are various degree of closeness between the US and each of the four countries. But crucial decisions about indigenous development of weapon systems or perception of threat are influenced. Thus Japan is willing to accept TMS offered by the US ostensibly against North Korea and obliquely against China. But South Korea has chosen to reject this offer. In the case of Israel the decision to give up indigineous development of weapons was determined by the US offer of military grant to it. As a result more information about these four countries is available in the US than in the countries themselves.

Again much is made in the study of the poor levels of knowledge of security matters, prevalence of traditional or non-institutional means of influence, etc. While all this could be true, they are not the cause but a result of the regime of 'confidentiality'. What is also forgotten is that for public accountability to be the guiding principle, power of the parliament to demand information, monitor budget and expenditure has to be established under law. The exact balance between right to know and need to know has to be defined and demarcated in a way that supremacy of the parliament is not compromised. This would mean that there can be no bar to parliament receiving or demanding information from the government. Whether or not this information should be publicised, or what can be and what ought not to be publicised should be strictly governed, without disallowing parliament or its committees from exercising control.

Finally, one immense sense of satisfaction in reading the book are the footnotes which identify where to look for information and also are in themselves rich sources of information. This icing together with the focus on 'accountability' makes this a useful and timely book.

not liable to such mercurial fluctuations. This is why it is important to establish universalistic norms to which there must be an overall collective allegiance. Citizenship becomes relevant in this context as it is a universal status that is equally bestowed on every individual within the nation-state. This is what prompted T.H. Marshall to comment that citizenship has a 'tendency towards equality' [Marshall 1977]. This is also why citizenship is a modern concept as rights of citizens equalise people who may otherwise be very different in terms of wealth, power, status, or achievement.

The phrase 'tendency towards equality' has several implications. First it signifies that citizenship does not make people substantively equal at one stroke, but provides the basic conditions for attaining this objective. Secondly, citizenship is, therefore, not a passive concept but is one that must be realised actively in practice [see also Walzer 1987: 216; Turner 1990: 207]. Finally, citizenship is a status with a role attached that favours a certain direction, or 'tendency' in the fulfilment of social goals or projects. Citizenship is then a dynamic concept in the sense that it creates fresh tasks for itself in the quest for greater civic freedoms. The manner in which universal franchise was achieved, and the way in which rights expanded from the civil to the political to the social, are examples of this forward drive [Marshall 1963: 76, 81].

It is because of this perpetual quest to realise greater freedoms that liberal democracy is today concerned with the question of protecting cultures and in figuring out the most acceptable modalities for doing so. As Will Kymlicka correctly states, "Finding a way to liberalise a cultural community without destroying it is the task that liberals face in each country" [Kymlicka 1989: 170]. The problem then is to be able to address particularistic demands within the framework of universal norms, in this case, those enjoined by citizenship. The advantage of factoring in citizenship in advance lies in enabling us to consciously steer clear of getting nostalgic about tradition, and also in realising that any reconciliation of particularism with universalistic norms must be found in the modern context of a liberal democratic nation state. Citizenship, as we know too well, is impossible to imagine in ancient and medieval societies where monarchies, empires, chiefdoms, but not nation states, existed. It is, therefore, only at the level of the nation state that citizenship can have any substantive meaning and value. This

emphasis on the nation state is quite in keeping with our project of liberalising particularistic demands on the ground rules set by modernity, as the nation state too is a typically modern phenomenon.

MINORITY DEMANDS AND LIBERAL DEMOCRACY: ON RIGHTS AND DUTIES

There have been a variety of particularistic demands ever since democracy made all communities and individuals theoretically equal. Disputes that used to be settled by war and bloodshed in the past, are today carried to courts, tribunals, and, as is most frequently the case, to the hustings. Cultural differences and confrontations are no longer episodic in character, but a daily, routine grind. It is therefore imperative to be able to establish ground rules and foundational principles for resolving such disputes without endangering the foundations of liberal democracy.

It need not be dilated at length that democracy is not just about majority rule, but also about protecting minorities, both political and cultural. It is not so much magnanimity that compels liberalism to be favourably disposed towards particularistic demands, even when they are voiced by minorities. In pre-democratic, absolutist regimes minorities could only depend on benevolence and magnanimity to survive. In a liberal democratic society, however, minorities are protected for very selfish reasons. The most significant being that minorities keep alive options that the majority might one day want to switch over to. They provide alternatives in what would otherwise be a closed set up that allows little possibility for further development and refinement of the majority community, no matter how it is defined or how it comes into being. This is why it is important to be vigilant, and not allow democracy to slide into becoming a species of majoritarian rule.

The fact that particularistic demands are an issue in democratic societies is because of liberalism's sensitivity to minority claims. Normally minorities are seen in terms of language and religion alone. This is entirely an outcome of convention and there is no analytical reason behind it. Consequently, such a restriction is really quite arbitrary. But if the resolution of demands that stem from particularistic cultures were made the dominant concern, then it is easy to enlarge the scope of minorities to include all those whose particularistic demands go against what is attributed as the majority position.

The claims of particularism are always made in the language of rights. It is thus

rights to nature, rights to culture, rights to religion, right to a certain form of livelihood, and so forth. It must be clarified immediately, that it is not as if such demands are accepted 'rights' in every case, but that they are always made in the language of rights. Sometimes the vocabulary of rights is used illegitimately. This is because, as we shall soon see, not all these demands can be accepted by a liberal democracy without endangering its basic rationale. And when such illegitimate demands are accepted they inevitably leave a telling and debilitating mark on the body of a democratic society. Ultimately, once again it is really a question of the principles on the basis of which particularisms can be given room within the overall framework of the universalistic norms of citizenship.

In order to flesh out citizenship in a substantive fashion and not let it languish simply as a legal title, the duties of the nation state must also be clearly postulated. It is said that there are no rights without duties. But rights are what we demand from the state, and duties are what we fulfil by virtue of being members of the state. In doing our duties we are not realising ourselves directly as much as we are making the conditions in which such realisations possible, in a general sense. The duties of the state are thus fashioned keeping in mind the dignity of the individual and individual rights. This is yet another departure from tradition.

In tradition, rights never occupied centre stage, it was always duties: duties to king and emperor, duties to the community, duties to parents, and so on. An individual had no locus of his or her own in society. It was only through membership in a community that a person received an identity. It is then rather anachronistic that Article 29.1. of the United Nations Universal Declaration of Human Rights [1948] should insist that "[e]very one has duties to the community in which alone the free and full development of his personality is possible." To lay down such duties to the community is a backward looking resolution. Modern liberal democracy makes it quite clear that only citizenship can enlarge one's potentialities for development. A community can be very uncaring about individual freedoms or about the rights of citizenship.¹ For this reason Albert Hirschman said that a citizen should be able to choose the right to 'exit' from the community. Hirschman goes further to give the right to exit from the community greater weight than the right to voice within the community [see Walzer 1983: 218].

In modern times citizenship gives rights first, on the basis of which duties are spelt out. But these duties are not at the level of the individual but at the level of the state. In meeting these duties a citizen must respect other citizens as individuals before anything else. "Hence citizenship", according to Walzer, "has a certain practical pre-eminence among all our actual and possible memberships" [Walzer 1992:105].

So even when some of the exponents of particularistic demands are nostalgic about 'tradition', they continue to frame their claims in the language of rights. This itself reveals a very modern perspective and a very modern attitude. When demands are cast in terms of rights the direct implication is that as citizens every individual has a right towards self-realisation. Liberal democracy must therefore make sure that the conditions for such realisations are protected. Even when demands are made that traditional methods of livelihood be protected it is because certain individuals find those to be the best vehicles for their self-realisation. It is not as if tradition is to be retained as a good in itself. In most cases, however, it is misplaced romanticism that furthers the belief that people want to stand by traditional forms of livelihood even when modern alternatives are available.

For example, Gandhians in the Vedchi programme in Valod district in Gujarat, India, discovered to their dismay that tribal students did not want to learn about agricultural techniques, or about spinning cotton, or about handicrafts. Instead they wanted to learn English, science and mathematics which would help them towards, what they considered, was a better future [Shah 1986: 212-3]. In tribal movement for land rights too, urban activists are more keen than the tribals themselves to remain "close to nature" [Baviskar 1997: 215].

In the traditional regime of duties the state and community were superior to the individual. In the modern regime of rights the individual comes before membership to any other organisation. In modern democracies the shoe is really on the other foot. It is now up to the state to perform certain duties so that individuals can exercise their rights, without the strong and the privileged always prevailing over the weak. The tension between particularism and universalism can then be restated. The accommodation of particularistic demands in a universalistic framework should be further understood in terms of how particularistic demands, expressed as minority rights, can be reconciled with the legitimate duties of a

liberal nation state. As Rawls argues, it is not a question of balancing altruism with selfishness at all. This is because "persons need one another since it is only in active co-operation with others that one's powers reach fruition. Only in a social union is the individual complete" [Rawls 1971:525; see also Rousseau 1913, especially Book I, Chapter VI; see also Rawls 1974].

FOR A MINIMUM SET OF RESEMBLANCES

It is at this point that Durkheim should be read into liberal theories, particularly into the contributions of John Rawls. Like Rawls, Durkheim also believed that individualism comes into its own only at a particular stage in history. Individualism too is not equated simplistically with contracts, for in a situation of inequality contracts often allow the strong to exploit the weak. It is for this reason that though formal individual liberty and contract were necessary, Durkheim felt there was still so much left to be done to regulate the activities of the modern state [Durkheim 1957: 31; see also Durkheim 1961].

To understand the duties of the state it is better to recall Durkheim's *Division of Labour in Society* (1933). As is well known Durkheim contrasted societies with mechanical solidarity against those with organic solidarity. In mechanical solidarity, people cohere on account of their sameness, but in organic solidarity, cohesion is brought about by a division of labour. While all this is familiar terrain what needs to be attended to is that the contrast between mechanical and organic solidarity should not be seen as a dichotomy. In other words, for Durkheim, while there can be societies based solely on mechanical solidarity, it is impossible for a society to exist on the strength of organic solidarity alone [ibid: 398, 405; see also ibid: 290, 360]. For organic division of labour to establish itself it needs the substrate of mechanical solidarity. Mechanical solidarity provides the basis on which organic solidarity can grow.

The fundamental principle of mechanical solidarity is resemblance. If organic differentiation were not established on mechanical solidarity then society would cease to be a collective enterprise. This basic sameness not only brings about mechanical solidarity but also provides societies with their moral core [ibid: 298]. This is why Durkheim pointedly asserted that "one's first duty is to resemble everybody else" [ibid: emphasis mine].

It is still not clear though how this 'first duty' (mark the word 'duty') to resemble everybody else can be worked out. But this

much is certain that such a duty cannot exist in hierarchical caste structures or in feudal societies. It is only in democratic societies through the medium of citizenship that the first duty to resemble everybody else can be approximated.

Resemblances in this case, i.e., in the sense of 'first duty', should not be understood in terms of similarities of actual goods that people possess or in terms of isomorphic aesthetic preferences and lifestyles. If to resemble should be our first and not last duty, then it is only to ensure that the tenet of equality of opportunity is effectively realised by equalising the basic conditions for competition. Rawls principle of justice as fairness only says that offices should be open to all [Rawls 1971: 124]. But what if people never get the chance to earn those qualifications necessary to fill that office?

A minimum set of resemblances, as articulated by Durkheim, can then be understood as a set of practices that are open to all individuals so that they can acquire socially useful assets in terms of skills and talents. This would minimally mean access to education, knowledge, and health. This should minimise the differences that come with family backgrounds and with the accidents of birth.

If the core of citizenship is consolidated by a minimum set of resemblances made up of practices that allow people to acquire socially valued skills and talents, then individual differences will be a matter of choice, and not birth [see also Rawls 1971: 102, 218; and Dworkin 1977: 141-150]. Lord Marshall very perceptively noted that the "uniform status of citizenship ... provided the foundation of equality on which the structure of inequality could be built" [quoted in Marshall 1963: 91].

This is an important clarification that needs attending to. The uniform status of citizenship should not be confused with perfectionist utopias that visualise equality in all respects. This is why the provisions for attaining this basic set of resemblances cannot be equated with ultimate goods. What the basic set of resemblances entails is that the conditions for acquiring socially valuable skills be realistically open to all. Without this the most systematic and generalised possibilities of inter-subjectivity, on which liberal democracy is based, would be perjured.

This also means that if sectional privileges run counter to the building of this minimum set of resemblances then there is little reason to support their continuation. Minority rights then become legitimate only when they do not prevent members of that community, or of any

other community, in gaining access to skills that are prized in the society as a whole. Therefore, if certain sections of the population insist that women from their community should not be allowed access to secular educational facilities, or to work outside the home, or that polygamy should be legalised, a liberal democratic state has no alternative but to oppose them. Any concession on these matters would immediately consign women to a second rate status and thus thwart the attainment of a minimum set of resemblances.

Likewise, those observances of minority communities that do not come in the way of consolidating such resemblances can be allowed to exist. The conflict over headscarf worn by Islamic women in France was a needless debate [see Hervieu-Leget 1998]. The headscarf did not interfere with the acquisition of either education, or other skills required to maintain and develop the minimum set of resemblances. The right to worship, or the right to learn heritage languages, are other such issues, which do not ordinarily come in the way of promoting a minimum set of resemblances. Therefore, when particularistic demands do not contradict the making of a minimum set of resemblances they can, and should be, accommodated within the universalistic framework of citizenship. This would enjoin the state to be active in maintaining its obligations to perform duties and not adopt a cultural *laissez faire* attitude [Parekh 1995].

With this perspective in mind let us now examine the Indian examples of particularisms. As we proceed with this paper there will be many occasions to return to the themes of citizenship, particularly of the notion of minimum set of resemblances as has just been enunciated. India, on the face of it, is a very inhospitable locale for cultivating this minimum set of resemblances. A closer examination will however yield a more sympathetic reading. Though India is a vast storehouse of cultural differences, this has not meant a collapse of universalism, albeit universalism has been under considerable stress in this country. In some cases, at least, universalism has suffered because there is a lack of clarity regarding citizenship and what are legitimate minority demands. Often enough, minority spokespeople have been given greater legitimacy than they should have been given as they were not made to pass the acid test of whether or not they uphold the development of a "minimum set of resemblances". Any attempt to block opportunities to attain this minimum set of resemblances cannot be encouraged within the context of citizenship and

liberal democracy. If individuals should choose of their own accord not to exercise the right to access those areas of opportunity that provide for the development of a minimum set of resemblances, then it is an option they are free to adopt. But this choice should affect only them and nobody else – not their families, not their children.

In India there are two major issues around which particularistic demands have been put forward. The first concerns the right to nature and to products of nature, and the second has to do with religious and community rights. Let us see to what extent such demands carry legitimacy and the extent to which they can be met by a state that adheres to liberal democratic principles.

RIGHT TO NATURE

This demand is usually made by those whose means of livelihood are under threat on account of incursions of the technologically superior market economy. Typically people like the fisherfolk or tribals play a primary role in agitations that revolve around the issue of right to nature. This is quite understandable for fisherfolk and tribals are threatened most directly by agencies of contemporary market forces, such as large-scale trawlers and timber contractors, respectively.

At this stage it is important to analyse what exactly do fisherfolk or tribals hope to protect when they demand their right to nature, as it were. Do they want to continue fishing and foresting the way they used to without any hindrance? Do they want superior access to the marketability of marine and nature products? Do they also want to protect their cultural artefacts, cuisine, and aesthetic productions? In my view the answer to the third question is dependent on the first two. If fisherfolk or tribals want to change their way of life they would not really be interested in holding on to their ancient crafts in the same fashion as they used to earlier. Artefacts would get genuine patronage if the producers of such goods are interested in continuing with such productions and find them socially viable.

Fisherfolk do not just fish: they fish using traditional methods and are threatened by technologically superior trawlers. Fishing will continue even if small-scale fisherfolk die out. The case of forest dwelling 'tribals' is somewhat similar. Outsiders too threaten them. Though there are obvious differences between fisherfolk and forest dwellers, they do not immediately concern us here.

When fisherfolk protest against large-scale trawlers and claim a prior right to

the produce of the seas then on what basis should their demand be entertained? In this connection the following questions become relevant: (i) Is it that small-scale fishing is intrinsically valuable and worth protecting no matter what its social costs are, or what damage it causes to those who want to bring in trawlers? (ii) What kind of fishing would the fisherfolk like to practise if realisable alternatives were provided to them? Fishing their way? Or with trawlers? (iii) Finally, what alternatives exist for fisherfolk other than to fish in one form or another?

If the answer to the first question is 'yes' then it must justify why the damage done to trawler operators is of little consequence to the society. An unqualified 'yes' in this case can only exist if the society decides to be autarkic. In which case there is no scope for further development of social skills. Though this satisfies the argument for sameness it is only at a gross level, the sameness is not of the kind that can be a springboard for higher levels of differentiation and specialisation. For this reason such an option is not an attractive one for liberal democracy to adopt.

The second question throws up more interesting possibilities. If, for instance, fisherfolk are given the opportunity to operate with trawlers and yet refuse to do so, then the market situation should prevail. The fisherfolk are fully aware of the limitations of the old form of fishing, but if they choose to continue with it, the state can do little to intervene. It cannot protect fisherfolk without harming the interests of the trawler-based operators.

Should fisherfolk choose trawler-based fishing but if they do not have the wherewithal to pursue this option, how then can their demand be met within the optic of universalism? This indeed is the option, and it deserves to be considered in greater depth. Most fisherfolk would like to use trawlers, but oppose their introduction because they lack access to this higher form of technology. The issue then is how to formulate state interventions that uphold the universalistic spirit of liberal democracy, and yet give fisherfolk realistic access to trawlers. In this case, as well as in many others in which state intervention is called for, the results are not immediate.

It all begins with setting in motion a process that would first break through the carapace hardened by the inactivity and unconcern of earlier regimes. Given the fact that the generation of minimum set of resemblances is a project that cannot be realised in one swift motion, it is necessary to build conditions that over

time will help in its actualisation. Time features yet again, as the minimum set of resemblances is also a moving and dynamic quotient that needs to be constantly scaled upwards. Given this implication of time, all projects towards attaining the minimum set of resemblances have to be future-oriented in which the initial small steps can later lead to marching with larger strides.

Against this background, if fisherfolk prefer trawler-based fishing but are unable to put this preference into practice, then the state can come in by giving the fisherfolk the first claim to the use of this advanced fishing technology. But on what grounds can the first claim to trawlers be reserved for fisherfolk? Why should the more affluent trawler operators not object that such a policy is causing unjust harm to them?

We can begin by rejecting this objection with the help of Rawls. Rawls' difference principle whereby the more privileged classes should not be allowed to prosper at the expense of the 'worst off' [Rawls 1971: 60, 124, 132, 199] can be profitably invoked at this juncture. But the difference principle holds only if fisherfolk would like to be trawler operators themselves but are held back for want of funds and resources. In case the fisherfolk refuse the option altogether, then it is the market principle that will become effective. In which case it will not be John Rawls but Ronald Coase who will become relevant [Coase 1960: 16-19].

By giving the fisherfolk the first claim to the use of trawlers both autarky and atavism are put to rest. Neither is the first claim being given to fisherfolk because they need to be compensated. The fisherfolk have prior claim for two reasons. If they are not protected then the better off can call on pure market forces and their callous determination, to decimate the worst off. This denouement is far from what Rawls would consider as being 'fair'. But to be fair is not the same as being impartial. A liberal democratic state must be fair and not impartial and it therefore should not act simply as a night watchman.

The second reason to give the fisherfolk first claim to trawlers is because that would be the quickest way of making the worse off better than what they have been thus far. The fisherfolk could profitably use the knowledge base the community has gathered over years and generations to launch into trawler fishing and do so successfully. As the democratic state is committed to making higher levels of technology, and indeed all forms of knowledge, accessible to all, it would be unfair not to give the

fisherfolk an opportunity in this matter. This is particularly so because the fisherfolk have a foundational knowledge in this field that is held back from forging ahead simply on account of insufficient economic resources. The prior privileges of birth and wealth should not by themselves allow a class such as that of international trawler operators to dominate over others.

Once the community of fisherfolk stabilises itself at a higher level there is no need for protecting and privileging them any longer. The level playing field should then come into operation. In the meantime the policy of favouring the fisherfolk is in keeping with the fact that though the attainment of minimum set of resemblances is future oriented and spread out over time, efforts must nevertheless be made to reduce the time element as much as possible. Democracy, in any case, encourages a definite sense of impatience. It is for this reason that policies initiated by liberal democracies are also judged in terms of how quickly they come into effect. Things are supposed to happen in one's lifetime and in the not too long run.

The policy of giving the under privileged fisherfolk the first right to higher forms of technology easily accommodates the particular interests of the community with universalistic imperatives of citizenship. This model can be used in the case of other under-privileged communities as well with appropriate modifications. That such a scenario can be envisaged at all is because we are no longer wedded to the ideal that traditional communities should preserve their traditional methods. It is more important to begin by first assessing the felt needs of these people, and then to make sure that the attainment of the minimum set of resemblances takes place in the shortest time possible. If such a community refuses to garner socially valuable skills after the avenues to do so have been made available to it, then its economic misery cannot be alleviated by any liberal democratic universalistic format. Protection of a mode of livelihood for its own idiosyncratic sake can hardly be on any liberal democratic agenda. To hold back knowledge in perpetuity is against humanity and causes unjustifiable damage to those who want to exploit it to their advantage [see also United Nations' International Covenant on Economic, Social and Cultural Rights, 1966, Article 15.1.b].

The rationale for giving fisherfolk the first claim to technology is analogous to the manner in which liberal democracies set up minority educational institutions. State funded minority institutions are not

for furthering sectarian knowledge. Elements and emblems of minority culture are protected in these institutions not for their own sake but for creating a larger pool of people with a minimum set of resemblances. Familiar settings allow these newer skills to be absorbed much more efficiently than would have been possible otherwise. In this process the society as a whole would benefit and prosper. If the democratic duty of the state is to enlarge the socially useful knowledge base and enhance skills it is more efficient to purvey these in an atmosphere of familiarity rather than in one of alienation. Likewise, for the fisherfolk too it is much more efficient to start them on the road to attaining the minimum set of resemblances on the basis of a knowledge base over which members of this community have some control. This would help fisherfolk to attain the minimum set of resemblances on a much surer footing, and, what is equally important, in a shorter period of time.

Building on the knowledge base of under privileged communities is clearly not the same as protecting this knowledge so that an alternative lifestyle does not become extinct. This is what Will Kymlicka advocates in a number of ways [Kymlicka 1989: 165-7; Kymlicka 1995: 108-115]. Kymlicka would like such communities to be preserved intact because perhaps some day their lifestyle will give others an active option. The question really is: how are such ways of life to be maintained? If the people themselves want to move out of their earlier modes of livelihood when they are given the option to do so then it would be a waste of precious state resources to artificially prop these antiquated systems in a theme park fashion - and this time on scarce public resources. State support of moribund ways of life is really the work of a willful culture commissariat, and does not really behove of a democratic nation state.

MINORITY RIGHTS

In order to address the issue of minority rights it needs once again to be mentioned that elements of culture that do not discriminate between individuals on account of birth, nor come in the way of creating a minimum set of resemblances should on no account be proscribed. Nor is it that the minority always makes things so testy for democracy. Both minority and majority communities could be equally guilty of occluding the free development of a minimum set of resemblances. The problem however is that when the majority community blocks the attainment of a minimum set of resemblances, very little

attention is paid to it. Majoritarianism calmly stands in for democracy and most people do not see the contradiction. It is only when minorities become culpable on such issues that a great degree of public controversy is generated. For example, while there are many provisions in traditional Hindu laws of succession that discriminate against women, it is the Islamic code bill, particularly the provisions relating to marriage and inheritance, that are routinely subjected to political criticism.

Predictably, issues of this sort tend to get a religious and sectarian orientation. If left unresolved over longish periods of time, the chances of inter-faith mistrust and even violence become imminent. In contemporary India secularism often appears as an embattled ideology, no longer sanguine about its future. To a large extent it is because the Indian state has neither been quick or adroit enough to disarticulate sectarian prejudices by demanding that we all, majority and minority alike, inwardly introspect and weed out antiquated customs. But sectarians, both of majority and minority communities, have held up this process largely on account of our misreading of secularism and minority protection. Most public defenders of secularism view minorities as static entities that should be protected without putting them under any liberal pressure. Hindu sectarians, on the other hand, would like minorities to dissolve their specific diacritics completely and submerge themselves into what they consider to be the 'Hindu way of life'.

Against this background it must also be said that it is not as if Hindu sectarian politics have been consistently triumphant. In fact, India's career as an independent nation state has largely been one that has spurned Hindu sectarianism. That the Bharatiya Janata Party (BJP) leads the ruling coalition in India should not obscure the fact that it is constantly forced to officially hold back, if not publicly distance itself from, any expression of hostility towards religious minorities. This is because there are other members of the coalition who do not endorse Hindu sectarianism the way the BJP does. In other words, both the so-called 'secular' and 'communal' political alternatives co-exist in contemporary India.

If we shift our attention from secularism, which is an ideology, to secularisation which is a process, we realise that both the existence of multiple political options, and the fluctuations in their political fortunes, are very much par for the course. It is this that heightens fears among

religious minorities, particularly during those phases when majoritarianist sectarians gain a political edge.

In seeking to protect religious minorities various policies have been contemplated, and even put into practice. These range from devising special code bills for religious minorities to setting up of minority educational institutions. These provisions are put in place in the hope that they would enable minority cultures and practices to survive and make the atmosphere against them less hostile. To a large extent this takes care of Kymlicka's fear that without specific legislation minority cultures might die out [Kymlicka 1995: 111]. But this does not mean that those aspects of minority cultures that go against the basic freedoms and inhibit the attainment of a minimum set of resemblances among its members should receive support. On this issue, Kymlicka is far from being unequivocal. Therefore, it should still be up to the state to decide which aspects in the culture of a minority community [and majority too] can be protected, and which other aspects of culture have to be jettisoned.

If the test is the extent to which cultures respect basic freedoms, which includes the freedom to acquire the minimum set of resemblances, then there is little need to legislate in terms of blanket cultural protection. As wearing a turban, or a head-dress, or learning a language, does not in any way restrict basic freedoms (as long as they are not forced upon members of the community), nor come in the way of substantively realising a minimum set of resemblances among members of the community, any objection to them is clearly an example of majority prejudice.

The minimum set of resemblances in no way enjoins cultural homogeneity. As a matter of fact the emphasis on these minimum resemblances undercuts the cultural homogenisers' programme altogether. Thus the existence of different aesthetic styles, languages and rituals in no way impedes the development and consolidation of citizenship as long as the free access to acquire the minimum set of resemblances is open to all.

This should also temper to a certain extent Robert Bellah's argument on civil religions [Bellah 1967]. For Bellah civil religion in America has brought about a rather general agreement on the public symbols of the state and on how public rituals should be performed. Though much of America's civil religion originates in Protestantism, public emblems and rituals have been sufficiently de-theologised. They no longer possess any religious

significance and have gained an independent status of their own. If there is a general consensus such as this, and the religious provenance of certain public observances, including weekly holidays, have been sublated, then it is all for the better. Yet, at one level this is all very fortuitous. What if such an agreement has to be negotiated? What if charges and counter charges are being traded between members of different linguistic and religious communities? It is here that the notion of a 'minimum set of resemblances' again becomes relevant.

Matters like weekly holidays and official language can be a source of great irritation. Hindus might demand Tuesdays and Muslims Fridays as the weekly day off. In addition, different linguistic groups may clamour that their language be the official one. Obviously, a universalistic policy is required to sort out these particularistic demands. The most obvious solution would be to yield to majoritarian inclinations in all such instances. Though this may win a temporary reprieve, the chances are that it may also alienate minorities within the nation state. Even when the end result of any deliberation on public policy coincides with majority preferences, the rationale should always be one that is informed by liberal democratic considerations, and not majoritarianism. This is because majority opinion when given free rein can be stifling and intolerant in its hubris.

While democracy should not be equated with majoritarianism, neither should it be the case that legislation should create more problems than it resolves. A weekly holiday, which is Friday, would spell havoc in a non-Islamic country. If the official language of a country were that of a minority community that too would be inviting chaos on a very large scale. As citizenship is not a solipsistic venture, the preferences of the majority community make it convenient for citizens to work together. This should not prevent the state subsidising the teaching of minority languages if the membership of a particular community is above a critical minimum. Even if the state cannot satisfy all minority languages, the fact that a significant number of minority languages are imparted through state support reveals that there is no bias against minority languages as such. At least, if this much comes through transparently it will go a long way in assuaging minority grievances on the language issue.

Likewise with religious holidays too. India grants religious holidays to all major religions on certain significant occasions, though Sunday remains the weekly day off for everybody. Should the majority

community of Hindus demand Tuesday as the weekly holiday at this stage it might arouse anxieties within other religious denominations in the country. As such a move would smack of religious partisanship it needs to be resisted. Let us still consider the worst case scenario.

If the demand that Tuesdays be declared as the weekly day off were very strong, then holding it back would lead to other very deleterious consequences. It would not bring any advantage to minorities, but would on the other hand give a lot of scope for majoritarian sectarianism to grow. Further, it is not in the interest of minorities either that they be given some other day off instead. The counter argument that minorities should get their own weekly holiday is not a credible alternative. It will make it that much more difficult for minorities to attain and maintain the minimum set of resemblances. Minorities would now be at a definite disadvantage as an extra day's work, earnings and instruction will be denied to them. In such matters a delicate balancing of sensibilities is called for. Even here, as we have just seen, the criterion of satisfying the acquisition of a minimum set of resemblances can be very useful. Even if the end result coincides with majority inclination, the rationale for a uniform holiday is not prejudiced against minorities. As it is oriented towards helping minorities attain the minimum set of resemblances and progress further, liberal policy is not hurt unduly if it accepts such a majority demand.

Therefore, while weekly holidays must be uniform, even if in the worst case scenario the will of the majority prevails, minorities should get their share of public holidays on important religious and social occasions. Just as in the case of language instructions, this too might allay the fear of minority persecution. To opt in favour of a majority inclination is not always the same as minority persecution. When majority demands attempt to keep minorities from attaining the minimum set of resemblances, or when majority will is intolerant of minority practices that do not hinder the attainment of the minimum set of resemblances by the minority community, then, as we mentioned earlier in this paper, there is no reason at all why liberal democracy should make any concession to majority caprice.

All is not quite over yet. The inauguration of liberal democracy also means that a public sphere has been set up de facto. The public sphere is not one that is always marked by discussion on rational issues. When cultural matters come up emotion often tends to take precedence over reason.

Even so, while the public sphere can debate cultural questions, the rules of the game are set in advance with the concurrence of all its participants. In making this point I am slightly amending Jurgen Habermas's famous contribution to the conception of the public sphere [Habermas 1989]. As there now exists a public sphere made up of political parties, pressure groups, enterprise associations, voluntary organisations, and so on, the minority community can continuously represent its case even on issues like public holidays and language to a larger audience. Even if their point of view is not upheld *in toto*, their inputs will be an important factor in the formulation of future legislations. What cannot be entertained in the public sphere are those representations that deny basic freedoms, including the freedom to acquire the minimum set of resemblances. The only condition of the public sphere is that decisions taken at this level must be abided by even if they go against the stated position of the contending minority group or community. The minority is however free to bring the issue back as often as it may wish to. Seen in this light minority communities would function rather like enterprise associations as they would willingly abide by the norms of the public sphere.

MINORITY POLITICS

While discussing the subject of minorities it is worthwhile to spend some time on how the minority issue is often framed in India. As is to be expected in India minorities are officially visualised as fixed and permanent entities. Once this is done then a series of specific policies are devised such that these communities then become beneficiaries of special privileges. Such special privileges include in some cases a separate code hill, as with the Muslims, special minority institutions, and also special provisions in terms of housing, loans, and educational facilities, as formulated in Indira Gandhi's 15 Point Programme. Why minorities should not be able to pursue education simply by virtue of their rights as citizens is not made clear. The 15-Point Programme makes it appear that if the minorities get educated or find jobs it is because of the largesse of the Congress Party and Indira Gandhi in particular, and not because they are citizens. This is how the minority card gets to be played in contemporary politics.

In dispensations of this sort minorities are first given a fixed and inflexible nature which enables them to then become instruments of political machinations. This naturally gives community virtuosos a special position as individuals within the

community are deemed as unquestioning bearers of tradition. Nowhere has the government unambiguously specified that the desired goal with respect to minority policies is to prioritise the attainment of minimum set of resemblances over meeting purely cultural demands, or rather the demands of the cultural virtuosos. After the 1984 riots against Sikhs, this community has now been added to the list of minorities. It is not clear in what way the Sikhs would benefit from this categorisation. The Sikhs are both economically and politically powerful, and suffer from no social handicaps. By declaring them as official minorities, Sikh cultural virtuosos will now have an added edge to their presence. They will become more dominant and exercise a stronger influence in political decision-making, in addition to cornering a good deal of political patronage. The recent tercentenary celebration of the founding of the Sikh faith was an example of this. The government granted Rs 100 crore for this occasion. This huge sum of money soon became a source of bitter rivalry among different sections of the Sikh community.

The 1993 official notification of the government of India lists Muslims, Christians, Parsees, Buddhists and Sikhs as minority communities. Given the animosities against Christians, Sikhs and Muslims such a listing of minorities may seem justifiable, even 'natural'. But really the basis for such notifications deserves further scrutiny.

What makes a community a minority community is often a history of persecution against its members, but very often it is just a question of numbers, as with the Buddhists and Parsees. Therefore, communities can be deemed as minorities quite idiosyncratically. Sample the following variations: In the *Report on Advisory Committee on Minorities* (May 11, 1949), Muslims, scheduled castes (the so-called untouchables), and Indian Christians were considered minorities [Shiva Rao 1968a, vol 4: 604]. But some years earlier in the Constituent Assembly no less a person than K M Panikkar wanted the nambudiris to be listed as minorities [ibid: vol 2: 259]. The nambudiris incidentally are a very prosperous and influential caste of brahmins in the southern Indian province of Kerala. In the 1932 Ramsay MacDonald Communal Award even the powerful marathas were briefly considered for protection as a minority [Shiva Rao 1968b: 742]. When over 50 years ago Sardar Hukam Singh suggested in the Constituent Assembly that Parsees and Sikhs be given minority status it was turned

down [ibid: 772-73] with no significant complaints coming from either of these two communities. If the criteria for minority classification can be so arbitrary, and once classified, if the rewards to community virtuosos can be so tempting, then it should come as no surprise that even an organisation like the Ramakrishna Mission has staked its claim for minority status.

Does the answer then lie in just increasing the list of minorities as and when such demands come up? What good do such lists really do to minorities in terms of enhancing their participation as citizens? In this context it is worth recalling B R Ambedkar's warning against creating permanent minorities. According to Ambedkar a policy of this sort would create sectional interests from which only minority spokespeople and virtuosos would benefit [Shiva Rao 1968b: 766]. Instead of meeting demands of citizens, the aspirations of those belonging to minority communities will begin to be fashioned and sifted by the exigencies and compulsions of minority politics. Democracy would then degenerate to a game of numbers, vote banks and patrons. The net effect is that members of minority communities end up being much worse off than before. Only their virtuosos and spokespeople thrive, and along with them the minority baiters of the majority community.

MINORITISATION

Further, the designation of minorities in this fashion has a rather dangerous consequence. It is blind to the process and possibility of minoritisation. Minoritisation breaks protocol and targets those who are not yet official minorities. Minoritisation can make almost anybody into a minority as it does not play favourites. Minoritisation occurs because social dynamics does not allow for any stable relationships between communities to last over time. This is something that the mind set behind minority listing never quite comprehends. Stable relationships between communities, whether characterised by co-existence or otherwise, characterised pre-modern settings, with their slow paced natural economies and settled hierarchies. Modernity, and the unleashing of the process of secularisation, have brought unpredictability in their wake. It is no longer easy to forecast friends and enemies in advance. Sectarians can now come in many forms. Driven by the vicissitudes of contemporary existence, bigotry can create new minorities without the imprimatur of history. The official policy of secularism with its tendency to create permanent

minorities is quite incapable of rising to the occasion and meeting the challenge of minoritisation. In fact the manner in which minority policy is laid out and practised ideologically sanctions street politics to function along community lines.

Minoritisation occurs from the outside. It is not built up by cultural virtuosos within, but by sectarians without. Minoritisation happens without warning and swiftly persecutes a community that had no premonition that it would be targeted in this fashion. This is what happened to Sikhs in 1984 [yes, it can be timed that precisely]. Prior to the killings of Sikhs in Delhi and elsewhere in 1984 they had no clue that they would be hunted and quartered the way they were after Indira Gandhi's assassination. For decades Sikhs were popularly cast as the sword arm of Hinduism, and now suddenly they became Hindu's hated 'other'. During those tumultuous months of 1984 Hindus turned against Sikhs with such bloody vengeance that their much recorded and historically better known hatred towards Muslims was put in the shade.

Likewise, when Shiv Sena came into existence in 1966, south Indians in Mumbai suddenly found that they had become a persecuted minority in the city. South Indians, like the Sikhs, had no premonition of this turn of events prior to 1965 [see Gupta 1982: 71-5]. The Shiv Sena led 'sons of the soil' movement turned all those who were not of Maharashtrian parentage into outsiders, especially the immigrants from south India. An identical 'sons of the soil' movement in Assam converted Bengalis in that province into minorities too, leading to countless deaths, social dislocation, and looting of property.

Minoritisation takes place from the outside by others. Nobody would like to be minoritised, though the same cannot be said for the desire to be placed in the official list of minorities. Minoritisation pays no heed to stated 'minority policies' and can fell with one stroke the most elaborate taxonomy of minorities.

Minority categorisations which form the bases of state policies in several countries, and not just India, are hardly a satisfactory way of dealing with the minority question. As we have just argued, besides fostering divisions on ascriptive bases, such a policy leaves the door wide open for minoritisation to wreak havoc. As minoritisation is disrespectful of previous consensus, or even of standard history, it does not matter how extensively minorities are listed. Such a task will always be incomplete. Anyone could be the next victim, it could even be you. It is for this reason that it is important

to step out of such a framework and consider the question of minorities afresh, without being pressured by minority virtuosos, or by minority baiters. It must be realised that even after juggling with the many criteria for minority status is over, the threat of minoritisation is never really reduced. However, the one factor that remains resolute and indissoluble through all this is that of 'citizenship'.

As minoritisation is unpredictable in character, the next minority could be anyone, even you, it is best to proceed along the Rawlsian 'principle of difference' [Rawls 1971: 76-77]. According to this principle even the legislators are hypothetically behind the 'veil of ignorance' which prevents them from identifying their interests in advance. The veil of ignorance, which was only hypothetical in Rawls, takes on a more substantive and empirical bearing in the context of minority policy-making. As minoritisation is such an unpredictable process with such unpredictable outcomes, a safely ensconced majority community can suddenly be severed from the 'mainstream' and become a minority. This is what happened, at different points of time, to Sikhs all over north India, to south Indians in Mumbai, and to Bengalis in Assam.

With the principle of difference as a guiding thread citizenship is strengthened, for whether one belongs to a minority or majority community the basic rights as citizens can neither be taken away or threatened. One has the right to education, housing, etc, by virtue of being a citizen and not because the community has a benevolent patron. By focusing on citizenship, one can see the deficiencies of those policies that create permanent minorities, and thereby create rifts between citizens. The emphasis on citizenship also diminishes complacency among those who today think that they cannot be hurt by sectarian passions ever. This consolidates fraternity on a more enduring basis as citizenship emphasises the attainment of resemblances, while minority politics thrives on creating, establishing and heightening differences in the name of promoting diversities. But in most such cases the understanding of diversities is limited for it is not really about creating alternatives for citizens as much as boxing people into straitjacketed community grids.

DIVERSITIES, ALTERNATIVES AND INTEGRATION

Traditional societies had no conception of diversity for one could not rise above one's location in cultural space to view the entirety. In place of diversity, traditional

societies talked of strangeness, of wildness, of the lack of godliness [see Kluckhohn 1962:69]. Distances in cultural space were ontologically marked. This gave 'otherness' inhuman, immoral and, on the whole, unworthy, qualities. It is only in modern times that differences between cultures started being semaphored in epistemological terms.

Diversity is a positive value today because the nation state has brought about through citizenship a higher level of integration in which differences can be entertained in terms of multiple options. Such an appreciation of diversity never existed in the past though, very often, contemporary exhortations to respect diversity are often couched in traditionalistic terms.

The moral judgment to respect diversity notwithstanding, it is also a fact that the more defined the boundaries between cultural spaces, the lower the insertion of citizenship ethos, and consequently the more backward and traditional oriented a society tends to be. Diversities are not good in themselves. They are good only insofar as they do not conflict with citizenship and with the liberal democratic principle of realistically increasing one's range of options. To protect a Native American lifestyle, or those of the tribal community in India, in the name of diversity is thoroughly misplaced. This not only prevents members of such communities from attaining the minimum set of resemblances, but it also takes the pressure off the state from having to deliver to the under-privileged. The ruling elite can explain away its inaction in alleviating poverty among historically disprivileged peoples by claiming to be community sensitive.

Further, the argument that the cultures of tribals be preserved because it increases the range of options, is really quite absurd. There is no reason why the better off should want to choose to be the worst off. Liberal philosophy is ill-equipped to handle collective masochism. Moreover, it is not as if any one can decide to be a Native Indian or even an Irish Catholic just like that. There are strong membership rules that these communities have which would preclude a free exercise of options of this kind.

Diversities are compatible with citizenship when membership to diverse communities becomes a purely voluntary affair. But when diversities block such movements, as they constantly did in tradition, there is little that is worth recommending in them. That diversity even in recent times does not always mean alternative lifestyles but only distinctive

differences can be gauged in the manner in which there are constant problems between different categories of Native Indians in Canada [see Dyck 1992: 827]. Another variation on the same theme can be found in France between 1940 and 1944. After the German invasion of France, the Vichy regime under Marshall Petain, set about to emphasise French cultural purity where "there would be no mixing of modern with antique; authenticity ruled. Groups in one region were discouraged from singing songs or performing dances that originated elsewhere. The performer had to be from the region they represented and costumed in what was deemed to be traditional fashion" [Lcbovics 1992: 172].

In a modern democratic state diversities are acceptable only when they can actually promote alternative lifestyles and increase the range of choices. Kymlicka seems to accept this position but does not quite emphasise the difference between closed cultural practices and an open door policy towards alternative lifestyles. Generally, communities are not open to others, unlike communists and vegetarians [Tamir 1993: 149] for which reason they fail to pass the modern diversity test.

This should act as a corrective to all those who propagate respect for diversity as an unqualified end in itself. To value the existence of diverse, clearly segregated and distinct practices, is to collapse time scales in favour of returning to the rigidities of the past [see Bhabha 1990: 208]. With the establishment of the liberal democratic nation state diversities as recorded by history are replaced by existence of alternatives made up of artefacts, cuisines, and literature of diverse provenances. This allows people a wide range of choices without having to subscribe to, or being locked in, any one community all the way.

Such a process is quite clearly evident in America today. Even the spatial confines of different communities, which till quite recently separated the Irish ghettos, from Polish ghettos, or from Jewish neighbourhoods, no longer exist in quite the same way. The division between these communities was deep enough in the past so that as late as the 1930s the socialist movement was divided into the Jerusalem Socialist Party, the Italian Socialist Party, and soon. Today, a little more than 50 years later, but still within a lifetime, things have changed so much that even Jews have now become 'white folks' [Sacks 1994: 83-4].

It needs to be remembered then that diversity is now a cherished value in America, but this is after traditional boundaries have more or less become extinct in that country. Surveys in America

show that Blacks too are entering White spaces in greater numbers over the last 30 years – 40 per cent of Blacks now hold middle class jobs compared to just 20 per cent in 1960. Today one out of every 10 college students is Black – almost double of what it used to be in the 1960s. Given the fact that Blacks comprise roughly 11 per cent of America's population, the figure of college-going Blacks is certainly very impressive [see Kilson 1983: 85-6]. Additionally, identifying oneself to census enumerators as Irish-American or German-American is a matter of ego-centred preference. Self-identification of this sort is the only way one can relate to cultural heritage as the increasing rate of cross-cultural marriages in America have taken the bottom out of any purist notion of ascription [Sanjek 1994]. Tradition, or some version of it, survives because of the commitment to a self-chosen past by ego-focused culture bearers. It is not a determined community with its strict rules of membership and allegiance that matter at all. This form of diversity is perfectly compatible with democracy, choice and citizenship. It meets the needs of cultural fulfilment without demanding traditional observance.²

Diversity is compatible with citizenship only if it does not come in the way of acquiring the minimum set of resemblances. Rhetoric aside, this is apparently how it functions in fact in a country like America, so why should it be any different in India? Or anywhere else? American diversity resists the melting pot theory but in a limited way. If the melting pot metaphor is supposed to signify homogeneity of tastes, aesthetics, religious persuasions and artefacts, then diversity certainly has a different manifesto. But diversity American style, is certainly not intent on creating autonomous cultural enclaves. The credo of diversity gets activated only in areas where culture does not come in the way of prosperity and material advancement. It now remains for America to self-consciously accept this reality and accordingly shape policies that privilege the attainment of the minimum set of resemblances above all else.

In this connection it is also interesting to track down the circumstances that gave 'diversity', and with it 'multiculturalism' such an ideological fillip in modern times in the US. This will give a perspective on diversity and keep us in India from accepting extremist and purist versions of it.

The emphasis on diversity in India grew out of the compulsions of the nationalist movement as the entire subcontinent had to be united against British machination

to separate the colonised on the basis of language, religion, etc. This is what prompted the phrase 'unity in diversity' which Jawaharlal Nehru made particularly eloquent. This diversity still did not mean the enlarging of options but rather the co-existence of differences. It certainly played a role as an ideological mobiliser to neutralise British colonial policy but it is still some ways from being a truly modern credo. Unity in diversity is, in principle, akin to the hated American segregationist policy of 'separate but equal' which was finally taken off the statutes only as late as 1954. Such an equation would be horrifying to many in India primarily because they had never really interrogated the notion of diversity with any degree of thoroughness.

In north America diversity and the politics of multiculturalism came to the fore when first the Jewish community and then the diasporics began to raise their voices against cultural discrimination. Ironically, it is when ethnic divisions were getting blurred and the worst days of cultural discrimination were over that diversity, and along with it multiculturalism, began to be demanded by cultural minorities [see Steinberg 1989: 48-49]. In the days when immigrants from China, India, Africa and south-east Asia had fewer avenues for realising substantive citizenship there was hardly any clamour from among them for the appreciation of cultural diversity or for equality of cultural status. In Canada, for decades, those of south Asian origin did not have the right to vote. In America, Chinese immigrants were locked in filthy rooms without any basic rights. Yet they did not complain. If anything the light on their behalf was carried out by benevolent Americans and Canadians, who in any case were too few in number to be a decisive voice.

It was the Jewish community that first raised the issue of cultural dignity in north America. The timing of their demand coincided almost perfectly with the growing demand for, and the eventual realisation of, a Jewish homeland in Israel. The old, gentle, scholarly, rabbinical model of Jewish masculinity was replaced by a more militant one. As the colonised countries gradually gained independence and attained nation state status the diasporics from these regions began to be more vociferous about their cultural rights, and about multiculturalism. The realisation that 'back home' their compatriots had moved from indignity to freedom and citizenship gave them the pride they hitherto lacked in demanding greater cultural recognition in the land of their

adoption. True, this sentiment could have been expressed much earlier when times were much worse, but at that point they felt inadequate as in the land of their origin they were still subject people. If other Blacks in America consider the Haitians among them as being haughty and superior in their disposition, it is probably because Haiti was the first Caribbean nation to become independent of colonial rule.

As diversity and multiculturalism have become regnant motifs at a time when cultural isolationism and discrimination are much lower than what they used to be, they signal the opening up of individual choices and alternatives rather than the closing down of cultural shutters. Old fashioned diversity closed off the possibilities of people realising their basic freedoms which should also include, as we have argued, the attainment of a minimum set of resemblances. If diversity is to be accepted today it should be only along those self-conscious protocols established by modern liberal democracy which ceaselessly expands the conception of citizenship.

The tenor of our argument throughout this paper is that liberal democracy should be more concerned with people rather than with things, with survivors and not with survivals. When we share our humanity with others it becomes apparent that those from other cultures are not that different and exotic after all. A universalistic liberal democratic society should devise policies that help people from disprivileged cultures to survive and surge ahead instead of treating them like precious historic survivals. When the latter mode manifests itself in whichever context then it is obviously an outcome of unexamined prejudice.

Fortunately, anthropology today is working hard to rid itself of such hubris, and this is a lesson that other disciplines could well learn from. Liberal democracy owes allegiance to human beings as fully fleshed subjects of humanity and not as exotic species to be uplifted by benevolence. In the ultimate analysis then, it is empathy, and not sympathy, that can guide the resolution of particularistic demands within a universalistic framework. Empathy calls out to citizenship, while sympathy makes people dependents. As dependency thrives in a regime of patronage, liberal democracy and universalism are of little relevance to it.

That liberal democracy is deliberating over the need to find universalistic principles for resolving particularistic cultural disputes is a further demonstration of how the quest for enlarging citizenship in an

activist fashion is an ongoing enterprise. Such a task requires the concerted efforts of social scientists, humanitarians, lawyers and specialists. But more than anything else it requires that we look into ourselves and pledge to share our humanity with others.

Notes

[This is a revised version of a paper that was first presented in a workshop on 'Changing Legal Cultures' organised by the International Institute for the Sociology of Law in Onati, Spain, on June 26, 1999. I am grateful to all the participants to this workshop for their detailed comments, in particular to Martin Krygier.]

- 1 In 1993 the Jats of West Uttar Pradesh and Haryana came together in what was called a 'Sarvachhap Panchayat' and unanimously passed resolutions regarding marriage, education, liquor consumption, and inheritance. Some of these resolutions were benevolent, especially those related to dowry and conspicuous consumption. But there were other resolutions that stridently forbade divorce, female inheritance, and co-educational institutions. Any violation of these rules was to be punished by ostracism, and, in some cases, by fines. It should also be recalled that in many instances couples have been killed by the community, with the full complicity of their respective parents, for going against traditional opinion [Gupta 1997: 200-3].
- 2 Blacks in America still cannot move in and out of cultural spaces like the others can. A Black is always a Black no matter what the particular blood-line may be. There are some attempts to officially recognise this as an anomaly, but in popular opinion, Blacks are still unable to self-identify like the White population in America can. This is why Black culture has a greater sense of distinctiveness than the other 'ethnic' cultures in America. Yet given the rate of Black mobility it is quite likely that this too may become a thing of the past over the next millennium.

Third Edition of National Accounts Statistics of India 1950-51 to 1996-97

Data for 47 years in each of the 40 revised and updated table series on different dimensions of national accounts aggregates are presented.

On state domestic product, for the first time statistical series on both net and gross SDP in respect of all 25 states and three union territories for 17 years from 1980-81 to 1996-97 are available.

Descriptions of the concepts involved and methods and procedures of data compilation adopted have been further expanded; likewise the extensive references to the analytical literature on national accounts and related literature.

Shri Mantosh Sondhi

Ladies and Gentlemen,

On behalf of the Board of Directors and on my own behalf, I extend to you all a very warm and cordial welcome to the 10th Annual General Meeting of your Company. The Notice convening the meeting, the Directors' Report and the Audited Accounts for the year ended March 31, 1999 have been with you for some time now and with your permission, I shall take them as read.

At the very outset, I will like to salute our Armed Forces, particularly the valiant young Officers and Jawans laying their lives on the line for us, who with their acts of bravery, patriotism, sense of commitment and unflinching loyalty to the nation, re-captured the areas in Kargil Sector in J & K, which were illegally occupied. As a token of our gratitude to our Armed Forces, your Company made a humble contribution of Rs 27.26 lacs, out of which Rs 7.26 lacs was contributed by the employees of the Company in the form of 1 to 5 days wages, and Rs 20 lacs by the Company to the Army Central Welfare Fund.

The Economy

May I now say a few words about the economy. In 1998, the economic growth was affected adversely by turbulent conditions in South East Asian economies and slow down of world GDP growth to less than 2 percent. As a result of international economic environment, our exports declined by 1.2% to US Dollar 33.6 billion from US Dollar 34 billion in the year 1997-98. This adversely affected industrial growth, which rose by only 5.2%, as compared to growth of 6.6% in 1997-98. However, rich farm growth of 7.6 percent came to the rescue of the economy and we could achieve overall GDP growth of 6 percent, as against 5% in the preceding year. The current scene looks promising with good rains so far in 31 out of 35 meteorological subdivisions and with the reversal of the declining trend in industrial production, particularly in the core sectors such as steel and cement. General indication of consumer confidence is also

DSCL

DCM SHRIRAM CONSOLIDATED LTD.

Speech by Shri Mantosh Sondhi, Chairman at the Annual General Meeting of the Company held on August 3, 1999 at New Delhi

encouraging as indicated by increase in sales of both consumer durables and fast moving consumer goods. The inflation rate was also 20 years low at 1.83% on 3rd July this year. During the period under review, the Government has taken a number of measures to give a further impetus to the reforms process for which they deserve to be complimented. Some of these measures are - abolition of Urban Land Ceiling Act, delicensing of sugar, allowing buy back of shares upto 25% and further liberalisation of direct foreign investment. Reforms in the financial sector and taxation are some of the other measures, which would help the economy. Some other measures like the Bill on opening up of insurance have been a casualty of dissolution of the last Lok Sabha. One hopes that all those steps, which will ensure faster growth of the economy, will be taken up by the new Government in right earnest, soon after its installation in October/November this year. As I have said earlier, one good trend which has gradually been emerging is that politics and economics are getting disassociated from each other. The behaviour of sensex in the recent weeks is also an indicator of this. Apart from the resounding success of our Armed Forces at Kargil, two other basic reasons for the sensex to attain new heights were the soundness of our economic fundamentals and the fact that the Election Commission was able to announce definite time frame for the conduct of elections, including in Kashmir, which was a clear demonstration that India is a well established and flourishing democracy.

Reforms in the agricultural and infrastructural sectors have to go a long way to make the economy vibrant. The steps taken so far, though on the right lines, are not adequate and their implementation is slow. It is necessary that in electricity, roads development, rail and road transport, communication and financial sectors, we should be more efficient. Wastage and pilferages should be checked and their working made more economical and consumer friendly. This will be possible when private sector is given a bigger role and road blocks in the working of public sector undertakings, about which we have been talking for decades now but with no tangible results, are removed.

Reorganisation of the Businesses

In the changing business scenario, marked by increasing international competition and rising stakeholder expectations, it has become imperative to build a focussed and proactive organisation.

With this in view, company operations were re-organised in October, 1998 into Strategic Business Units (SBUs). The organisation has thus moved from a functional structure to a business focussed structure in order to build a culture of excellence in financial performance and entrepreneurship.

The reorganisation has been implemented smoothly and the results are very encouraging. There is better understanding of business issues/opportunities along with a systematic effort to reduce cost including fixed costs and overhead expenses. This is reflected in a higher gross profit inspite of a marginal decrease in the turnover due to no trading in DAP.

Review of Operations

During the year ended March 31, 1999, due to overall depression in industry and no trading in DAP throughout the year, sales of your Company at Rs 632.47 crores were marginally lower compared to sales of Rs 637.63 crores last year. Similarly, the net profit was lower at Rs 21.62 crores as compared to Rs 23.97 crores in 1997-98. All the units performed satisfactorily and contributed towards this performance. Inspite of decrease in net profit your Board of Directors have maintained and recommended a dividend of 40% on the equity capital.

A. Fertiliser & Power Business

During the year, the performance of this SBU in terms of production, operating efficiency and profits was satisfactory inspite of scheduled stoppage for 27 days of Urea Plant for overhauling and maintenance. During the year, this SBU received National Productivity Award for second best productivity performance in the country for the year 1996-97.

Our Coal based captive power plants at Kota have continued to work at a plant load factor of over 90% on the average, which is well above the national average. Similarly, the performance of our DG Sets at Bharuch has been comparatively very economical. The Company is planning to commission an additional 10 MW power plant at Kota Complex by March, 2000 which again should prove an excellent decision. The salient features of this decision are that by using re-furbished existing boiler, the project cost and the time frame for its implementation have been significantly reduced.

B. Agri Business

During the year under review, as a result of improved availability of Urea in the country, there was pressure on sales. The

SHRIRAM UREA • SHRIRAM CEMENT • PVC RESIN &

depressed market conditions are likely to continue this year as well due to higher buffer stocks and expected production. During the year, there was practically no trading in DAP due to uncertain Govt. policies on subsidy. However, the Company has plans to import DAP and market it through its net working in the current year. The Company has made a beginning in trading of NPK fertiliser manufactured by indigenous manufacturers. Efforts are being made to increase volumes and explore possibilities of marketing more such items in the current year. The trading in hybrid seeds and pesticides continued satisfactorily during the year.

C. Plastics Business

During the year under review, due to oversupply and lower demand, PVC market remained depressed. To improve the margins, your Company also produced marketable Calcium Carbide which has been well accepted by the market and Company now plans to increase its production in the current year. As the PVC prices have now started looking up, it is expected that the profitability of this SBU will improve in the current year.

D. Cement Business

During the year, the Company has upgraded its total production from 43 grade to 53 grade as a part of further improvement. This new grade has also become popular and is fetching premium in Northern markets. The profitability was adversely affected due to depressed market conditions during the year under review. Fortunately, cement prices have now gradually started looking up.

E. Chemical Business

Chlor-alkali operations at Kota and Bharuch were affected due to prevailing oversupply situation and depressed prices. In this context, efforts made to reduce costs yielded good results. The Kota plant achieved 98% and Bharuch plant 88% capacity utilisation, which is well above the industry average.

The Shriram Alkali & Chemicals unit at Bharuch improved exports of caustic soda to reach a record level of 3444 MT during the year under review. In order to increase profitability of this business, it is proposed to take up some value added businesses related to Chlor-alkali. The Company has commenced work on putting up production facilities for stable bleaching powder and poly aluminium chloride at Kota.

F. Textiles

The textile mills of the Company, Swatantra Bharat Mills and DCM Silk Mills were closed down in Delhi in November, 1996 pursuant to the Supreme Court directive for relocation of industries from Delhi. Both the units were re-established in Rajasthan shortly thereafter. However, the workmen did not report for duty at the new sites.

Later, towards the end of April, 1998, 893 workmen of SBM opted to report for duty at

Tonk. However, a large number of these workmen were reluctant to work and were interested in a voluntary retirement package. In October, 1998, on the initiative of the workmen, a voluntary retirement settlement was arrived at consequent to which, only 370 workmen have stayed on in Tonk. Since then by recruiting fresh workers, production is being stabilized. As regards DSM workmen, there is no change in the status as no worker has reported for duty so far at Alwar.

The preparatory work for re-development of the sites vacated by SBM/DCM Silk Mills, Delhi has progressed satisfactorily along with the Joint Venture partner. However, several common issues relating to all such industries remain pending for clarification before the Supreme Court.

Environment

Shriram Environment & Allied Services at Kota, recognised by the Department of Science & Technology, set up to carry out research and development work in the field of environment continues to do well.

Subsidiary Companies

During the year, 40.75 lac quintals Cane was crushed in the sugar plant at Ghaghara Sugar Limited, Lakhimpur Kheri in U.P. Cane survey report for the season 1999-2000 indicates an increase in cane sowing by approx. 25% in our command area which will result in a significant increase in cane availability during the current crushing season. The Company is also planning to enhance crushing capacity of the plant during the current year.

The working of DCM Shriram Credit & Investments Ltd., a wholly owned subsidiary of your Company, has been satisfactory. In the case of another subsidiary, DCM Shriram Acqua Foods Ltd., the aquaculture project at Karaikal, Pondicherry continues to be on hold on account of Interim Order of the Supreme Court against a Public Interest Litigation filed with them.

IT Initiative/Quality Management & Education Processes

During the year under review, the Company progressed on implementation of SAP R/3 - a world renowned ERP package. While the first phase went live from 1st April, 1998, the second and final phase has been implemented and gone live since January, 1999. The Company received 'SAP Star Customer Award - 1998' for its successful and speedy implementation of the package. Significant benefits by way of improvements in business processes are already visible through implementation of this ERP package. The endeavour now, is to tap and leverage the enormous potential of this system to further transform the way we work.

In order to create an organisation culture with a more focussed customer orientation and to retain competitive and winning edge in each of our businesses, Quality management and education processes were institutionalised last year with the assistance of IQL, a subsidiary of NIIT. This year, it has proceeded well in the

organisation and its coverage has now been extended to all parts of the Company, including workers. This Quality Movement has helped to bring about a significant attitudinal change and substantial cost saving across the Company.

Year 2000 Compliance (Y2K)

The Compliance work began in end 1997. The Company does not foresee any problems in the operation due to Y2K related issues. The Company expects to achieve 'clean Y2K status' by end August, 1999.

Industrial Relations

The Company continued to maintain harmonious and cordial relations with its workers in all its divisions, which enabled it to achieve higher performance levels on all fronts.

Human Resource Development

The progress of the Company during the last 9 years, is in a large measure due to the quality of our human resource. Human Resource Development in your Company continues to receive high priority. We are working to create an organisation that is highly motivated, dynamic and adaptable to the changing business environment.

Prospects for the Current Year

In the first three months of the current financial year i.e. April to June 1999, sales of your Company at Rs 178.94 crores are substantially higher as compared to sales of Rs 134.17 crores in the previous year. During this period, the Company has earned a net profit of Rs 7.15 crores, as against a loss of Rs 4.65 crores in the corresponding period last year. The Company is quite hopeful that overall, the current year should end on a satisfactory note. It is a matter of great satisfaction that comparatively small investments made in the last few years on the balancing as well as on modernisation and up-gradation of plant and equipment have now started paying handsome dividends.

Acknowledgments

Ladies and Gentlemen, in conclusion, I would like to compliment the Management Team of your Company led by Shri Ajay S. Shriram and Shri Vikram S. Shriram for their excellent performance. Your Company has an outstanding management team at all levels with exceptionally good team work. The Directors also wish to thank the Government authorities, financial institutions, bankers, business associates and shareholders for their co-operation and support extended to the Company. The Directors also place on record their deep appreciation for the contributions made by employees at all levels to improve the working of the Company.

Thank you

Note: This does not purport to be a record of the proceedings of the Annual General Meeting

India's Emerging Economic Challenges

Vijay Kelkar

A review of the strategic policy failures which landed the Indian economy, till very recently, in a low-productivity, low-growth impasse and a discussion of the critical areas to focus on in the next phase of economic reforms.

IN the last few years, the Indian economy has been a sea of tranquillity in the turbulent world economy, especially in the Asian region. In fact, in the year 1998 India achieved one of the highest growth rates in the world and this year the growth rate is expected to be higher than last year. Equally, in terms of other macro-economic indicators, such as the rate of inflation or exchange rate stability, once again the performance of the Indian economy in recent years has been quite outstanding. The rate of inflation is less than 4 per cent and exchange rates have been relatively stable. There is, in fact, some evidence that during the nineties the growth rate in India has shown some acceleration. However, there are a number of weaknesses which we need to overcome to meet the objective of rapidly removing poverty. It is necessary to look at the Indian economy in a somewhat longer perspective and identify the necessary policy reforms and initiatives.

In India's economic history, there is little doubt that our independence will be marked as a major discontinuity. Since independence, India has achieved remarkable progress in overcoming the long-term colonial stagnation and economic backwardness. We were indeed fortunate that our destiny was guided by a group of remarkably talented leaders led by India's first prime minister, Jawahar Lal Nehru. They had a well-defined worldview and equally well articulated strategy. The strategic objective was to create a self-reliant economy independent of the international capitalist bloc. The aspiration of the national leadership was clear: they wanted to create a vibrant national economy and eradicate poverty as rapidly as possible. Given the weakness of the entrepreneurial class and the absence of well-functioning capital markets, the state was assigned the role of accelerating capital accumulation and was also required to become an entrepreneur, particularly for creating heavy and basic industries. Consequently, the public sector became the leading agent for industrialisation.

This strategy did pay off. It substantially accelerated the growth rate, it created the social and industrial infrastructure and the technological base for defence production

as well as in the sophisticated and strategic nuclear and space fields.

In implementing the strategy one of the major problems soon faced was the failure on the agricultural front, which led to our dependence on PL-480 food imports. This strategic shortcoming was quickly overcome by the launching of the green revolution to achieve the objective of self-reliance for food security.

These achievements are indeed historic when we recognise that all this was achieved essentially under a democratic form of governance, without colonial exploitation and while facing the challenges of a demographic explosion.

These achievements are outstanding when compared to our own historical standards, but seen in the context of the contemporary experience of other economies of Asia, such as China, Japan or South Korea, our performance is far short. India, at the time of independence, had almost similar levels of per capita income as China or Korea but since then both these economies have surpassed India in terms of per capita incomes or share in the global economy whether in manufacturing output or in global trade. Per capita income in Korea is US \$ 10,550 while ours is still \$ 390. The gross domestic product of China was \$ 825 billion in 1997 which is more than two times ours and has been achieved through a sustained growth of more than 7 per cent per annum over the last two decades. The per capita income growth of the other miracle economies of south-east Asia has been two to three times ours for the last few decades. Comparison with these economies is also not very flattering for us in the area of human development. Although we have made gains in life expectancy and in other indicators, once again we are behind compared to these dynamic economies of Asia in terms of the Human Development Index. Similarly, while we see the outstanding performance of these economies in overcoming poverty, we have the dubious distinction of housing the world's largest number of the poor.

While talking about such international comparisons there is one interesting and important point, namely, although in levels of living as measured in per capita

income terms or in human development index terms, India lags behind, in terms of indicators of equity such as the 'Gini Index' which summarises the distribution of income or consumption in an economy, India is among the top 10 developing countries. The *World Development Report 1998* of the World Bank shows that our consumption distribution is perhaps less inequitable compared to that in the US and in some other developed economies. In a recently published paper, S R Hashim shows that in India the 'Gini Index' may have been improving over the Plan periods, albeit marginally. Given the quality of data on consumption distribution, we can at least maintain a weaker version of this finding, i.e., there is no evidence that the distribution has deteriorated. This is an important point because in the opinion of many of our Left analysts, India is considered to be one of the worst sufferers from income inequality and it is said to be getting worse. Obviously, the data do not support this. This brings us to the heart of our economic problem, namely, for the curse of our poverty the villain is low per capita income due to relatively low growth rates. In other words, what India faces is the problem of low productivity across sectors as well as of low growth in this productivity. This is the crux of India's persistent, cruel poverty.

LOW PRODUCTIVITY, LOW GROWTH IMPASSE

How did we get into this situation if, otherwise, the development process seems to have done the trick, namely, that of transforming a low savings economy into a high savings/high investment economy. During the 50 years of our planning, the rates of savings and investment which were only 10.4 per cent and 10.2 per cent respectively in 1951-52 have been more than doubled to 23.1 per cent and 24.8 per cent respectively by the end of Eighth Plan. In other words, the Indian people have made great sacrifices for making large investments, but the rate of return on these resources has not been increasing either to catch up with the dynamic developing economies or making available resources to eradicate poverty.

I think many factors have contributed to this low productivity and low growth

impasse. The first strategic error was the relative neglect of international trade. By neglecting international trade we forwent the possibilities of exploiting productivity enhancing exchanges. In the manufacturing sector we opted for an across-the-board import substitution strategy where we sought to produce everything in a production chain whether the product was a commercial vehicle or a steel mill. And by this the weakest link decided the strength of the whole production chain. We entered into a number of activities in which we just did not possess the competitive edge. It resulted in a loss of efficiency for the entire industry. For instance, by forcing the Indian fertiliser industry to use only Indian designed catalysts, the entire fertiliser industry's productivity suffered. The same was the case of the electronics sector where our software industry took time to take off because of the insistence on the use of domestic computer hardware. What all these examples show is that we just did not allow international trade to enlarge the possibilities of using our own resources more efficiently and we ended up taxing our own productive sectors. Even in foreign trade we concentrated on the socialist economies and neglected the trade linkages with the emerging dynamic areas, particularly that of east Asia including Japan. Had our external trade been linked to rapidly growing Japan, the whole economic growth trajectory could have been so different.

Yet another strategic limitation was the relative neglect of agriculture. Arther Lewis has so clearly shown that it is the productivity of agriculture which decides the gains from economic development. Not only did we neglect investments in agriculture and in related activities such as irrigation, but we also manipulated the terms of trade against agriculture. This was a copybook harking back to the debate between Stalin and Bukharin. Sharad Joshi has considerable power when he argues for liberating India's agricultural sector from the present regime of controls. We missed the exciting possibilities of employment expansion from value-added agriculture. This neglect had a profound impact on the growth process itself. Sukhamoy Chakravarty showed that the failure on the food economy front led to stop/go policies regarding public investment and this induced sharper business cycles, thereby reducing the underlying growth rate.

Equally, one of the major sources of weakness has been the working of our public sector. In designing the public sector we did not adequately think of the role

of incentives, particularly incentives provided for management or the bureaucracy to ensure that shareholder value or national wealth was maximised. Even our legal system may have further aggravated the problem by treating the public sector as an extension of the state, which only meant that we finally robbed the public sector of any risk-taking ability, the hallmark of an entrepreneur. Consequently, the public sector which was supposed to be the primary motive force of capital accumulation became a drain on fiscal resources.

DYSFUNCTIONAL SUBSIDIES

Another major factor adversely affecting the long-term growth rate is the curse of growing subsidisation and cross-subsidisation. The growth in subsidies have been very high. In 1971 the total explicit subsidy provided in the budget amounted to 3 per cent of gross domestic product and within two decades or so this share has increased almost four times to 12 per cent of GDP. According to recent research, subsidies now perhaps account for as much as 16 per cent of GDP. Of course, not all subsidies are bad. There are merit subsidies. There are subsidies where the social benefits are larger than the social costs. But these are less than even one-third of total subsidies. Subsidies essentially imply under-recovery of costs. These are being showered by both the centre and states, through direct budgetary outgoes or through forgone revenues. Similarly, there are implied subsidies through the under-performing of the public sector as well as other forms of indirect subsidies through cross-subsidisation. Let us take the example of non-performing public sector enterprises. Between 1950 and 1997 the stock of public sector investments has increased to almost Rs two lakh crore. This is when valued at book value. In terms of replacement value, which is analytically a more correct definition, these stocks are even higher. What is the rate of return? It is less than 3 per cent or so. If these investments had been achieving returns comparable to those of efficient enterprises, then the rates of return would have been two to three times higher. The difference between these is also an implicit subsidy paid for by the taxpayers.

Had the subsidies been going to the poor they could have been more defensible, but that is not the case. The bulk of the subsidies go to people who are not so poor. This is true even in the case of the food and fertiliser subsidies. These do not go to the rural poor. This ubiquitous and growing subsidy culture reflects a distortion

of the vision of our founding fathers who aimed at accelerated development and increasing living standards of all our people through higher incomes. What we are getting instead is a new grammar of Indian politics where subsidies have become a full stop for growth acceleration.

If these direct subsidies are bad enough, the impact of the curse of indirect subsidisation is worse. Not only are these subsidies non-transparent, as these are not dispensed from the Budget, but are effected through differential pricing of public sector produced goods and services. Further, they also lead to loss of international competitiveness of many of our major industries. The working of the curse of cross-subsidisation can be seen in all major sectors, such as electricity, railway transport, petroleum, telecommunications and so on. It is felt that charging different prices to different classes of consumers promotes the goal of social justice. What happens is exactly the opposite. Giving power free to the agricultural sector not only knocks out any incentive for efficient use of electricity on the demand side, but on supply side it leads to a deterioration in the quality of electricity supplies. In a market economy, you can either fix the price or fix the quantity but cannot do both over a long period of time. Consequently, farmers get intermittent power supply which adversely affects their economics while simultaneously affecting the SEBs' financial health. This has further adverse implications for the industrial sector. Electricity charges for the industrial sector are many times higher than those paid by the agricultural and household sectors. This adversely affects the competitive strength of our industry and once again weakens the growth of exports and employment. Similar phenomena exist in railways where freight rates are pegged much higher than costs to cross-subsidise passenger travel. This has affected the efficient use of resources as well as international competitiveness. Till the recent reforms in telephone tariffs, a similar situation existed in the telecom sector.

Finally, one of the biggest drags on India's development has come from the growth of government consumption which is expenditure on current consumption. This is because of the size of the government and the compensation given to employees of government and semi-government organisations. The compensation of government employees has been revised upwards with successive pay commissions, not always consistent with the state's capacity to pay or the underlying quality of the administration.

With the latest Pay Commission decision, public consumption will go up by as much as 2 per cent of gross domestic product and this has become a major source of fiscal stress for both central and state government finances.

The growing revenue and fiscal deficits have led to enhanced market borrowing by the government. This leads to squeezing out private sector borrowing as well as to higher interest rates. Currently, almost 80 per cent of private financial savings are being absorbed by public sector borrowing. Consequently, the cruel choice is between higher inflation by the printing of money and higher interest rates which choke investment and employment growth. The ultimate outcome is, of course, lower growth rates. Clearly, the key to India's prosperity lies in reversing these factors.

REFORMS: THE NEXT PHASE

If the analysis presented so far is correct, then the policy initiatives that are required are obvious. What is necessary now is the launching of the next wave of reforms. The first phase of reforms launched in 1991 by Manmohan Singh and Narasinha Rao were essentially crisis-driven. This time round we can have consensus-driven reforms so that we can act in anticipation of a crisis which would definitely visit up on us if present trends are allowed to continue.

The foremost reform measure that is required is to ensure fiscal health. It is for parliament to adopt the Fiscal Responsibility Act, which would limit revenue deficits and budget deficits and safeguard the economy from a debt trap. Such a strategy has been successfully deployed by a number of countries. Of course, merely passing the Fiscal Responsibility Act will not achieve a fiscal balance. What is required is simultaneous action both at the centre and the states to increase user charges particularly of electricity, water, transport, etc. so that resources are generated to increase investments and also improve the quality of these services. These measures would encourage private investment in these sectors and would reduce costs for consumers and improve quality by promoting competition.

Towards this, the most important reform would be redefining the role of government and down-sizing government while improving the quality of governance. The down-sizing of government will also mean privatisation of non-strategic public sector enterprises including banking sector. The only strategic public sector enterprises should be those dealing with atomic energy, space and defence produc-

tion. In all other areas we should privatise public sector enterprises. Of course, in this programme of re-engineering of the government, the state needs to play a more focused role in the fields of education, health and environment protection. Government also will have to play a critical role in promoting transparency and good governance.

Equally, the new parliament will need to review policies regarding size of government and also the principles of compensation to employees of government and semi-government agencies. Such new initiatives alone can ensure that the fiscal situation of the states and the centre becomes sustainable and that taxpayers get their money's worth.

One of the major implications of reforming the role of the government would be to create a new institutional architecture for the management of the economy – by recognising that we are now aiming to become a full-fledged modern market economy, where stability, predictability and transparency of policies are of fun-

damental importance. Such a new institutional architecture will have to have an independent monetary authority by giving greater independence to the Reserve Bank of India on the lines of the autonomy enjoyed by the Federal Reserve in the US or the Bank of England in the UK.

The new institutional architecture will also imply strengthening of independent regulatory agencies such as SEBI, TRAI, CERC, etc. and treating their independence at par with that of the judiciary. This will inspire confidence among both investors and consumers and promote competition in these sectors. What one also will be achieving is reduction of the distributive politics of cross-subsidisation.

The most important outcome of the fiscal correction would be reduction of both short-term and long-term real interest rates in the economy. Currently they are at unprecedented levels of 6-8 per cent. No country in the world has achieved a sustained high growth rate with such high interest rates. Bringing real interest rates in the neighbourhood of 3-5 per cent can

trigger a spectacular growth boom throughout the economy.

The centre piece of reforms will have to be to promote competition in product markets and the services sector by allowing free entry and freer international trade. This also means giving a level playing field to all entities, i.e., private sector and public sector. To achieve this, one of the foremost policy measures would be to reduce our tariff barriers. Today India has one of the world's highest tariff barriers: where the dynamic Asian economies have average rates of tariff of 5 per cent or so, ours is nearly 25 per cent. We need to accelerate the programme of tariff reduction and bring tariffs at par with the Asian level. The removal of non-tariff barriers is even more important, which means rapidly removing import controls on consumer goods and agricultural products and the elimination of reservation for the small-scale sector which is preventing India from making rapid strides in the export of labour-intensive products such as readymade garments, leather, toys, etc. Reservation means low levels of output which are unable to achieve quality of international standards. To capture the international market, quality and timely delivery are of strategic importance. When in the Tariff Commission, I had requested the National Council for Applied Economic Research (NCAER) to do a quantitative study of the effects of liberalisation, i.e., effects of promoting external and internal competition. The results show that the returns on internal liberalisation are far more important than those of external liberalisation. If non-tariff barriers are reduced by 50 per cent, the gains would be 1.5 per cent gross domestic product. This 1.5 per cent will be accruing every year, implying larger employment opportunities. If privatisation of public sector monopolies which are producing intermediate goods and services is included, the gains to the economy from internal liberalisation are even more spectacular. The experience of the US for the last 20 years, when the US liberalised power, natural gas, airlines, road transportation, railroad transportation, etc., shows that the gains have been 10-15 per cent of sectoral GDP. The experience of other countries is similar. The NCAER study indicated that the additional benefit to the economy can be as high as 3-4 per cent of the GDP. These are static efficiency gains. If dynamic efficiency gains due to new investments and new technologies are taken into account, the gains will be truly spectacular. These gains are essentially because of better incentives through the force of

competition. In other words, this is due to the potential which is already there in the economy and would not require any new physical investment or any new capital.

REFORM OF FACTOR MARKETS

Finally, the next wave of reforms should encompass factor markets. In the 1991 reforms, the emphasis was on reform of product markets by abolishing industrial licensing and import barriers. These reforms left the factor markets such as for labour, land, capital, natural resources like water and institutions relatively untouched. I am including 'institutions' as a factor of production. The term 'institutions' includes state and quasi-state institutions as well as the judiciary and civil society. Reform of labour markets is particularly important. The new post-industrial revolution requires flexibility in all operations. This means flexibility in labour markets is of phenomenal importance so that companies can respond with speed to changing market conditions. Our present laws of bankruptcy and corporate control also require reforms so that the market for corporate control becomes competitive. Factor market reforms would also need to cover the financial markets. The reform of factor markets would also need to be accompanied by innovative measures for creating a social safety net, such as the employment guarantee schemes of Maharashtra. In addition to such employment-oriented schemes, perhaps the time also has come to eliminate product-based subsidies including food subsidies and replace it by a negative income tax to improve equity while controlling the adverse impact on efficiency. An interesting variation on such policy instruments could be experimenting with food stamps and education vouchers for meeting the needs of the socially disadvantaged and weaker sections of society. These innovations recognise that government can be a financier but need not be a producer of such services. The heart of these reforms is to promote competition in all economic activities and support the creation of human capital, particularly through enlargement of quality primary education facilities to all. Evidence across countries at different stages of development shows that education or human capital provides lasting success in promoting equality in society.

In the first phase reforms essentially concentrated on reforms at the central government level. Now these have to be taken to the level of the states. Almost 40 per cent of our revenue and fiscal deficits is because of state finances. They need to

be rectified. Similarly, a number of reforms are required for improving the delivery system as all basic services such as education and health are after all delivered at the state level. Of course, a number of states have taken new initiatives for improving the quality of services. There are equally interesting things happening in the states of Madhya Pradesh, Rajasthan, Himachal Pradesh, Karnataka, etc., in the fields of education and health. People are accepting the 'think-global but act local' dictum and consequently there is growing competition amongst state governments to give better and improved services to industry, particularly the information technology industry which has the potential of transforming India at a very rapid rate.

A final point regarding the launching of next wave of reforms is that we need to show greater vigour and a greater sense of urgency. The reason for emphasising urgency is the unique state of our demographic transition. In the next couple of decades India will have the once-in-a-lifetime chance of having a population structure where the share of the working population will be the largest. After these decades, the process of aging will catch up and the vigour of the working population will decline. When a satellite is put into orbit, it requires high velocity to ensure exit from the earth's gravitational force; similarly, if our economy is to exit from the gravitational pull of poverty, it requires an exit velocity of double-digit growth rate over the next two decades.

This kind of high growth is feasible. The other miracle economies achieved it precisely when the share of the working population was the highest, maintaining high savings and investment rates and also increasing labour supply and productivity.

As we enter the new century, the economy stands at the crossroads. It can take either the 'business as usual' road which means continued poverty and the low-growth trap or the high road to prosperity through accelerated reforms. If we take this road, then there is no reason why India, by the year 2020, cannot achieve a per capita income of more than \$ 1,000 or more than ½ lakh rupees and wipe out poverty and illiteracy and also increase life expectancy by 10 years or more. At present we are among the bottom 20 of all the countries in terms of the Human Development Index. In the year 2020 we should be among the first 20. This is possible and it is entirely up to us to build the necessary consensus for accelerated reform and implement it.

The Two-Party Syndrome: Conservative versus Liberal?

Ranjit Sau

There is a palpable sigh of relief in some quarters under the impression that India is finally moving towards a virtual two-party system organised around certain conservative and liberal co-ordinates. But does India need that sort of a regime? In thoughts as well as in actions, the reign of this particular liberal consensus for about half a century has exacerbated social fragmentation, religious intolerance, and economic underdevelopment. There is no sign of change for the better in this consensus. The conservative consensus differs little from its rival. It invokes Hindu epics, which, in fact, glorify civil wars that had divided the people. The epic age of Indian spiritualism is marked by great diversity of thoughts which cannot possibly be contained within any one culture. And the other beliefs that emerged subsequently deserve no less respect. The conservative agenda is thus incoherent. Communalism and casteism are the two main threats today. The basic problem has two dimensions: inter-religion, and intra-religion.

This paper suggests a possibility of resolution, inspired by two universal truths, namely, human sanctity, and human rights; the former justifies the domain, while the latter enumerates the content. The first one is an ancient revelation in all religions; the second one is of recent origin. The basic ideals of India include secularism and equality in the civil society, full employment and growth in the economy, and democracy in polity. This paper tests the prevailing conservative and liberal consensus in the light of such standards. And, above all, it explores a possible path towards these ideals.

The thinkers of India are the inheritors of the great tradition of faith in reason.

— S Radhakrishnan (1929, vol 2:776)

IS India heading towards a two-party system? "Will a Congress... rejuvenate itself", wonders Anirudh Deshpande (1999:1242), "and roll back the tide of communalism represented by the National Democratic Alliance? Will the Congress emerge as the pivot of a liberal consensus in opposition to a conservative consensus revolving around the BJP (Bharatiya Janata Party) in a stable appropriate (sic) two-party system in future?" *The Economist* (London: April 4, 1998) sounds similar: "India's diversity could lead to a permanent coalition politics. Perhaps two major groups will emerge but there will be big disparities within each and therefore constant compromise."

The two-party theory, in some form or other, is doing rounds in India, no doubt. To take another example, Robin Archer (1999) cites certain similarities between India today and the US of a century and a half ago. In the mid-19th century, the Republican Party, he says, came into existence in America as a rival to the then ruling Democratic Party. To Archer, the BJP resembles the Republicans, and the Congress the Democrats. "Like the Republicans, the BJP is committed to a programme of cultural homogenisation through state enforcement of particular religious and moral values. Like the Democrats, the Congress is recommitting itself to the defence of cultural diversity through the maintenance of state neutrality of

religious and personal morality" [Archer 1999:891]. He suggests that consideration of these and other similarities "might help to clarify some of the possible consequences of contemporary Indian developments".

We agree with Archer that India and the US do share certain common features. Both have enormous ethnic, religious, and cultural diversity. If the US is a land of immigrants, so is India, albeit in a different time scale: if they had come to America over four centuries, the immigrants had taken a longer period of as many millennia to arrive in India.¹ However, we also reckon that a political system depends a great deal upon the prevailing economic and social order. The difference between India and the US on this count is fairly obvious, at any period of time. It would be surprising if India develops, in the near future, a political system comparable to the American model of any vintage.

India today, it seems to us, bears closer resemblance to Germany of mid-19th century. Marx (1843:133) described the then Germany thus: "What a spectacle! The infinite division of society into the most diverse races confronting one another with their petty antipathies, bad conscience and crude mediocrity, and which, precisely because of their mutual ambiguous and suspicious disposition, are treated by their masters without distinction, though with differing formalities, as merely tolerated existences. And they are to recognise and acknowledge the very fact that they are dominated, ruled and possessed as a concession from Heaven! On the other

hand there are the masters, whose greatness is in inverse proportion to their number!" Doesn't this sound familiar to India, where the society is divided by intricate lines of caste and religion, and antipathy is too mild a word to characterise the attitude among myriad petty communities?

Thoughts direct actions and theory provides plans for action. But a theory is meaningless unless it meets the needs of the people. To be meaningful a theory must draw its sustenance from actuality. In the words of Marx (1843:138): "Theory will be realised in a people only insofar as it is realisation of their needs. Will the enormous discrepancy between the demands of thought and the answers of... actuality be matched by a similar discrepancy between civil society and the state, and within civil society itself? Will theoretical needs be directly practical needs? It is not enough that thought strive to actualise itself; actuality must itself strive toward thought." To be sure, "Germany has not passed through the ... state of political emancipation at the same time as the modern nations [such as England and France]", Marx continues. "The very stage it has surpassed in theory it has not yet reached in practice" (emphasis added).

The contradiction that haunted Germany in the mid-19th century seems to be visiting upon India today: the gulf between thought or theory on one hand, and the actuality or practice on the other, is spectacular in India as well. In richness of thoughts India is well ahead of many a country for centuries, but in material conditions it

remains way behind. The hypothesis of two-party rule in India comes from the same stable. To judge its cogency and relevance we can proceed in two ways.

One way is to speculate on forthcoming election results, presidential discretion, and formation of coalitions – all of which are notoriously unpredictable. Besides, who knows when this party will split, that one will fold up, and the third one will merge? And who can tell which one is conservative and which one is liberal? Above all, what precisely is the difference between the two largest parties, if you look at their records? Let us remember that the Congress Party has resolved: "Hinduism is India's best guarantee of secularism" [Desai 1999:1561], while the leitmotif of the BJP is: "One nation, one people, one culture" [Khilnani 1997:151].

There is another way for testing the hypothesis of two-party rule in India; it is laid on more solid ground. It poses the problem in a framework of comparative terms: actuality vis-a-vis thoughts, practice vis-a-vis theory, civil society² vis-a-vis the state, and all those, in turn, across political parties. Here we shall take this route, following Marx, as cited above. We shall proceed in three steps: first, scrutinise the records of the two main parties, Congress and the BJP; then, define the task ahead; and finally, evaluate the two parties with reference to that benchmark.

LIBERAL CONSENSUS: THOUGHTS AND REALITY

The synthesis of a conservative consensus at the national political level is a recent phenomenon, beginning around 1998 when the BJP formed a coalition government at New Delhi. Before that India so long has been governed by a liberal consensus, mostly forged by the Congress. However, it is always difficult to define liberalism, more so in India which has a wide range of political parties of various hues. And to find an authentic documentation of liberalism, acceptable to everyone in this country, is nearly impossible. But we shall try. We shall take the Constitution of India as a canonical expression of liberalism in India. The reasons for this choice are as follows.

The constituent assembly had openly debated at length and in great depth. It kept in view almost all written or unwritten constitutions of the world. It was imbued with the spirit of democracy and secularism. Sixteen articles of the Constitution came into force on November 26, 1949, and the remaining provisions did so on January 26, 1950. The constituent assembly was a representative body; and the

Congress Party, itself an umbrella organisation of diverse interests, was the undisputed leader of the country at that time. There could not be a better moment to shape and codify the liberal consensus. Thus the constitution is the best available source to reflect liberal thoughts prevailing in India.

We shall consider three segments of the constitution, namely, the directive principles, the preamble, and the list of fundamental rights. The key point to observe is the individual's right to social equality and dignity, for it is on this factor that the history of India will turn. As a reference we shall cite a contemporary document – the Universal Declaration of Human Rights, adapted and proclaimed by the General Assembly of the United Nations on December 10, 1948, to which India is a signatory. We shall also cite several theoretical propositions, especially with respect to the individual's right to equality. There are, to be sure, at least six concepts of equality. It will transpire by this measure that the liberal thought of India has a blurred vision of democracy, its commitment to human rights is dubious, and its concept of the civil society is crippling.

To begin with, "the directive principles of state policy" are, we find, the least secure part of the Constitution, for they are merely "directives", which "shall not be enforceable by any court". It is only desired that "it shall be the duty of the state to apply these principles in making laws". A most generous portion of the directive principles reads as follows: "The state shall, within the limits of its economic capacity and development, make effective provision for securing the right to work, to education and to public assistance in cases of unemployment, old age, sickness and disablement, and in other cases of undeserved want" (Part IV, Article 41).³ Note that the state is called upon merely to "apply these principles in making laws". In a word, the Constitution abstains from the guarantee of individual's rights to work, to education, and to public assistance in need.

By way of comparison it may be mentioned that the Universal Declaration of Human Rights, in its Articles 23(1) and 25(1) proclaims: "Everyone has the right to work, to free choice of employment, to just and favourable conditions of work and to protection against unemployment. Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of

unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control."⁴ Evidently, the liberal thoughts of India fall far short of the standard set by the United Nations as early as 1948. There has not been much of an improvement in this respect since then.

The preamble of the Constitution of India echoes the slogan of the French Revolution, "Liberty, Equality, Fraternity", and adds "Justice" to it, but all in an abridged form. It grants all citizens the "Equality of status and opportunity". Now, there are five other concepts of equality. To evaluate this particular version, we ask: Status in what? Opportunity of what?

The Constitution enunciates the individual's fundamental right to equality essentially as follows: "equality before the law", equal access to "shops, public restaurants, hotels and places of public entertainment", wells, tanks, bathing 'ghats' and places of public resort maintained wholly or partly out of state funds or dedicated to the use of general public, and "equality of opportunity...in matters relating to employment or appointment to any office under the state". Evidently, the content of this equality is merely legalistic while the laws themselves may be repugnant by humane criteria. The core of the issue is that the Constitution does not accept a basic value, namely, the full equality of all human beings in society. To further compound this weakness it lists caste as a legitimate social category, and thereby makes caste a permanent feature of society for the duration of its own currency. But, we all know, caste is a negation of social equality. "[The caste system] does not admit that the individual has the right to determine his future and pursue his interests. ...The compulsory degradation of a large part of mankind is revolting to the refined natures who have a sense of the dignity of man and respect for the preciousness of human life. The right of every human soul to enter into the full heritage of the race must be recognised. Caste is a source of discord and mischief, and if it persists in its present form, it will affect with weakness and falsehood the people that cling to it" [Radhakrishnan 1940:378]. Yet, the Constitution envisages a nation that is divided essentially into three compartments: high-caste Hindus, low-caste and outcaste Hindus, and Muslim and other minorities.⁵ It does assure "the dignity of the individual", but not the equality of the quantum of dignity for all. It has thus opened the door for casteist and communal politics to the detriment of national interest.

Again, for comparison we note that the Universal Declaration of Human Rights reckons full equality of all individuals at birth – equality in dignity and rights. Its Article 1 reads: “All human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act towards one another in a spirit of brotherhood.”

Sen (1979, 1985, 1999) takes the concept of equality one big step further by not confining it to the status of the individual at the time of birth alone. “Equality of What?”, he asks. After critically reviewing the literature on utilitarian equality, total utility equality, and Rawlsian equality,⁶ he presents an alternative formulation of equality known as the basic capability equality, where the set of capabilities is defined to reflect the various combinations of functionings (‘beings’) the individual can achieve. Capability may well be seen, Sen explains, as a “freedom” type notion; it is a state of being that an individual can attain by choice. Radhakrishnan (1940: 378) seems to concur with the idea of basic capability equality when he says: “The right of every human soul to enter into the full heritage of the [human] race must be recognised.” By all counts, then, the fundamental right to equality that the Constitution grants is extremely narrow in scope, and uneven to individuals.

Now, as for the liberal thoughts on the economy, the celebrated five-year plans are the best references. The state assumed the role of a prime mover of economic development; it targeted full employment, poverty alleviation, universal education and health, self-sufficiency in food, self-reliance in industry, and the like, all within a definite time frame. A state that has been under foreign imperial rule for centuries, all on a sudden stirred itself up to embrace an ambitious agenda. On the eve of the departure of the British, on August 14, 1947, Jawaharlal Nehru addressed the constituent assembly with these words: “Long years ago we made a tryst with destiny, and now the time comes when we shall redeem the pledge.” “The achievement we celebrate today”, Nehru went on, “is but a step, an opening of opportunity, to the great triumphs and achievements that awaits us”. He reminded the nation that the task ahead included “the ending of poverty and ignorance and disease and inequality of opportunity” So much for liberal thoughts.

Half a century later, what is the actuality? “Even though the expansion of social opportunities was very much the central theme in the vision that the leaders of the Indian independence movement had

presented to the country at the time the British left, rather little attempt has, in fact, been made to turn that vision into any kind of reality” [Dreze and Sen 1995: vi]. This finding is reconfirmed in studies of Indian development in regional perspectives. “One of the broad conclusions to emerge is the need for much more radical change in the Indian economy and society, in order to achieve the basic goals that were unambiguously outlined at the time of India’s independence, but which still remains largely unaccomplished” [Sen 1997a: 4]. Such is the record of the liberal regime in India – in thought and in practice – over half a century since 1947.

CONSERVATIVE MANTRA: FORWARD TO THE EPIC PAST, ONLY

“Throughout the entire course of the history of Indian anti-colonialism”, writes Bose (1998: 2096), “religion as faith within the limits of morality, if not the limits of reason, had rarely impeded the cause of national unity and may in fact have assisted its realisation at key moments of struggle”. He continues: “The variegated symbols of religion as culture had enthused nationalists of many hues and colours but had seldom embittered relations between religious communities...”. Yet, today, half a century after the creation of India as a secular state, the two largest political parties are beating the drums of Hindu fanaticism, known as *hindutva* – one a softer version, the other a stronger brand – that divides the nation in two ways: among the Hindus, and across religions. Why is this downfall? What is there in the conservative consensus?

A society may be conceptually divided into three parts: economy, civil society, and polity, each with its own law of motion, but subject to the necessity of an overall consistency. In the event of a shock, from within or without, the three parts tend to adjust themselves to strike a new balance. Among them, the polity seems fairly malleable, and the economy somewhat less flexible, while the civil society is relatively stiff. India presents one of the extreme cases where the civil society is quite rigid. It is in this nature of the civil society that one can trace the roots of Hindu fundamentalism. We shall note the changes in the polity, and the economy, and then consider their effects on the civil society, and vice versa. From such churning would spring up the genie of *hindutva*.

The state is by far the biggest monopoly business in any country. It alone dispenses justice, defence, and law and order. It regulates the economy, and levies tax. The state is the biggest employer, and the largest collector of revenue. As the British

departed the mammoth state apparatus of India with all its monopoly businesses – legislative, executive, and judiciary – fell, as usual, on the lap of a tiny fraction of the population. This small group of fortunate people soon turned itself into a virtual clan, and expanded fast, sustained by Adam Smith’s (1776) principle of division of labour,⁷ and nourished by its close proximity to the bountiful treasury of the state. After all, politics is no mean business. General administration, economic regulation, election, and the like, involve a good deal of expertise and specialisation, and the returns here are fairly attractive, compared to those in any business in the economy. The civil society received its first shock by the arrival of this political clan, but had little difficulty in recognising the faces of its members, for they belong mostly to the upper echelon of society. A bigger surprise was in store.

Meanwhile, a twofold process was under way. One, the spread of capitalism in agriculture and the affirmative public actions in land relations, education, and employment have led to the formation and consolidation of caste-based communities. Two, challenged by established power-centres, these factions are getting active at political levels.⁸ In a word, here is double movement: first, forming divisive casteist communities, and then hurling them into political alliances for votes with a view to confront the *ancien regime* of the privileged [Alam 1999; Sau 1999]. Members of these brigades have come from the dark shadows of long deprivation; their faces are not very familiar to the traditional civil society of India. This silent uprising, as it were, was far more unnerving to the status quo than the above-mentioned political clan.

Events of the polity reverberated in the economy as well. Initially, five-year plans, public investment, and a comprehensive drive for modernisation imparted certain dynamism to the stagnant economy. Soon, the market came to re-establish its usual supremacy. Amidst ups and downs emerged a class of *nouveau riche*; a new pattern of hierarchy took shape among various economic groups. The traditional parity between the economy, civil society, and polity was disrupted. The economy and the polity are quick to come to terms with each other by give-and-take; or to look at it another way, the polity is the concentrated expression of the economy, or vice versa. But the civil society is a different matter; here religion holds sway, and the order is pre-ordained by the revealed divine will. Here is, then, an instance where two irresistible forces –

economy and polity – are acting upon an apparently unmovable object – the civil society.

According to the scriptures, the Hindu society is ordered in four 'varnas'; this number is fixed for ever. "The fourfold classification is conceived in the interest of world progress. It is not intended specially for the Hindus, but applies to the whole human race, which has one destiny which it seeks and increasingly attains through the countless millenniums of history. The true object of all human action is 'lokasamgraha' or the holding together of the human race in its evolution. In pursuance of such a view, Hindu leaders accepted primitive societies and foreign settlers such as the Greeks and Scythians into the Hindu fold and recognised their priestly families as brahmins and their fighting men as kshatriyas" [Radhakrishnan 1940:356-57]. It is not mentioned what happened to the other Greeks and Scythians who were neither priests nor soldiers, but ordinary folks.

Over time the range of varna itself has shrunk. Following the Islamic conquest and the British occupation of India, "the category of kshatriya inevitably became emptied of some of its meaning. Where large sections of the population became converted to Islam, as in the Punjab and Bengal, it became difficult to fit those people into the scheme of four varnas... People recognised the gaps and inconsistencies" [Beteille 1996:21]. With the fading away of varna, caste became the main frame of reference and ranking. But, now, the arrival of the political clan, consisting of a mixed bag of upper caste Hindus with a sprinkle of other communities, added to the confusion. And then the silent uprising of the lower castes with political and economic clout shook up the old regime in civil society to its foundation. For high-caste Hindus it meant a double loss. First, in Hinduism the temple was traditionally separate from the state. But no more. The state began to encroach in its territory. Second, there was also a cut-back in material terms as the number of claimants on the faltering economy was raised. In order to restore their glory and earthly possessions a small section of high-caste Hindus looked back into the past and invoked the epic age of Ramayana and Mahabharata (600BC-200AD) – the age of freshly established villages, private property, and a rigorous caste system, an era far more dogmatic than the preceding vedic period (1500BC-600BC). This is the genesis of Hindu fundamentalism today. It has been further aggravated by external factors which will be taken up in a moment.

Muslims are the second largest religious group in India. In fact, India is the home of the second largest Muslim population in the world, behind Indonesia, but ahead of even Pakistan today. Among all the religions Islam has the distinction of possessing a unique written scripture where "the divine message, literally, is available to mankind in writing". "It is also important in a religion which holds that the divine truth is not only a matter of doctrine about the nature of the world, but also, and perhaps primarily, a matter of quite detailed law concerning the conduct of life and society... The result is a legal blueprint of social order, which stands above the mere power and political authority. This transcendent law, when not actually found in the original and severely finite and circumscribed message, is to be found in the written elaborations of competent scholars, plus traditions putatively originating in the Messenger and the precepts and example left by Him and His Companions. They, in principle, constitute the normative model" [Gellner 1994:17].

Formally, Islam has no clergy, no priest. It does not separate religion from society, any more than it formally delinks religion from state. It does not possess, as some other civilisations are said to possess, an exemplary centre holding up the ideal to man, whether in a political or religious court. If anyone in practice performs such a role within Islam, it is the scholars, the theologians-jurists, the 'ulema'. But they do not constitute a sacramentally segregated caste or stratum: they can only claim scholarship, familiarity with the scripturally recorded social/legal ideal, and hence ability and will to practise and implement it, and no more. The political authority is only charged with enforcing divine law, rather than specifically or paradigmatically exemplifying it, let alone creating it. The polity must obey it, as must others, but none of them inherently constitutes either its source or its norm.

The Islamic normative model is contained in a recorded message and inferences from it, and not in any political authority as such. The availability of all this important, indeed crucial, information-in-writing inevitably enhances the social importance of the men who can read, the men of learning, the scholars. Long before the formulation of the modern ideals of separation of powers and an entrenched constitution, Islam in effect possessed a religious version of both: legislation was distinct from the executive because it has been pre-empted by the deity, and religion itself was above all the constitutional law of society.

There is a perceptible distinction – though not very sharp break in principle – between the scholastic practice of Islam which is found in affluent urban areas, and the relatively mystic observance of Islam commonly by urban poor and rural people. Scholars, often of urban background and rooted in the trading bourgeoisie of the towns, project a version of the faith which is scripturalist, rule-oriented, puritanical, literal, sober, egalitarian, anti-estatic. Perhaps such a religious style comes naturally to men of scholarly temperament, and perhaps it also corresponds to the values and lifestyle of the commercial urban class from which they sprang.

The natural inclinations or needs of quite extensive other segments of the population, particularly rural and urban poor, are somewhat distinct from those of their affluent brethren in towns and cities. They have little inclination or ability impelling them to devote their spare time to theological or jurisprudential learning. On the other hand, however, they do need ritual specialists to maintain and service periodic rituals, which fortify and define their identity and maintain stability and security. So arises the most characteristic institution of rural Islam – the saint cult. These Islamic saints are not dead icons unlike in the Catholic shore of the Mediterranean, but they are living, and performing service here and now, in person, rather than being revered for past sanctity. In folk Islam, saints are alive and well. "If priests ... do not exist, then they must be invented. And so they are" [Gellner 1994:18].

It is in terms of this old polarity and amiable symbiosis between the two practices of Islam, namely, urban and rural, i.e. scholastic and mystic, that the persisting vigour of Islam is not merely best described, but also best explained. The mystic form of Islam prevails among the rural people and the urban poor. As political centralisation, population explosion, urbanisation, and economic strain combine to violate the tranquillity of traditional life in villages and in urban slums the victims yearn for a change in their conceptual paradigm. They do not have to look back to some distant past of their own, or veer outside to embrace some foreign notion of 'westernisation'. They do have, in front of their eyes, a 'modern' version of their own religion in the form of urban, scholastic Islam, to which they now aspire. This process of conceptual transition has acquired the label of Islamic fundamentalism⁹

If the Islamic resurgence is a plebeian phenomenon, by this measure, the recent Hindu revival is an episode of the elites.

Its lineage goes back seven decades. The Bharatiya Janata Party (BJP) traces its origin to 1925, when the Rashtriya Swayamsevak Sangh (RSS) began self-defence force to protect Hindus in riots. The RSS's founder, Keshav Hedgewar, believed Hindus had been conquered repeatedly because they were weakened by internal dissension. He sought a modern, united Hindu society free of caste and regional divides. But the project was self-contradictory from the beginning. For 'casteless Hinduism' is but a trifle oxymoron in common perception. Vinayak Damodar Savarkar, meanwhile, in 1923, had published his book, *Hindutva: Who Is a Hindu?* The theory of hindutva aims at reconstructing and mobilising the Hindus through a complex process of exclusionist and majoritarian identification, based on the feeling of insecurity from, and hatred against, the carefully constructed evil and menacing 'other', who are none but a particular segment of the Indian society. However, if the criterion of pitribhumi (fatherland) and punyabhumi (holyland) for hindutva is strictly applied, then most of us have to be repatriated to central Asia, Africa or Mesopotamia. All the same, soon Savarkar came to be the supreme theoretician of the RSS; and, no wonder, his idea had to remain dominant for a long while.

Frustrated, the RSS felt the need for a political platform, so it helped create the party of Jan Sangh in the early 1950s; but even then hardly much popular attention came by its way. In 1977 election, the Jan Sangh and other opposition parties merged to form the Janata Party that routed the ruling Congress. The Janata Party split in two years. Regrouping, old Jan Sangh members formed the Bharatiya Janata Party, seeking new support by proclaiming 'Gandhian socialism'. That campaign yielded only two parliamentary seats in the general election of 1984. The BJP's first bid to govern at Delhi, in 1996, collapsed after just 13 days. The second one, in 1998, has been more successful.

Polls show that the BJP nowadays fares best among the young, urbanised and highly educated, who evidently have high correlation with high castes. Two facts, negative in nature, have propelled the party into power – stagnation of the economy, and disruption of the civil society. The BJP has made inroads into the civil society first, and then advanced to capture the polity: its predecessor Congress had followed the opposite sequence.

The BJP's mantra is: "one nation, one people, one culture". One nation, yes; one people, yes. But, one culture? Which

culture? Who tells it? Let alone the differences among religions of the country, there are wide gulfs between even the brahmanical systems of Hinduism itself, which are quite a few in number: the Nyaya, the Vaisesika, the Samkhya, the Yoga, the Purva Mimamsa, the Advaita Vedanta, the Saiva, the Sakta, and so on, each with its distinct cultural connotation. The BJP worships the deity Rama of the epic period. It is well known that the two epics of India glorify civil war – the Ramayana arrays the Aryans against the Dravidians, and the Mahabharata sets one Aryan tribe against another. For a long time the Ramayana has been at the centre of a divisive controversy in Tamil Nadu politics [Pinto 1999].

The epic period of Hindu philosophy "was an age keenly alive to intellectual interest, a period of immense philosophical activity and many-sided development. We cannot adequately describe the complex inspiration of the times. The people were labouring with the contradictions felt in the things without and the mind within. It was an age full of strange anomalies and contrasts. ...It was the era of Carvaks as well as of the Buddhists" [Radhakrishnan 1929, vol 1:272]. Whom in India today the BJP will appoint to tell us whether to follow the materialism of Lokayata or the Saivism of the Svetasvatara, or whatever there is in between or beyond?¹⁰ On hinduism has no one written book that lays down in details the mode of living. The concept of one culture among even the Hindus alone is a violation of some basic tenets of Hindu philosophy itself, let alone one culture for all Indians of different faiths.

One more word on Hinduism. The earliest reference to the four varnas is in the Rig-Veda, where they are described as having sprung from the body of the creative spirit, from his head, arms, thigh, and feet. This poetical image is intended to convey the organic character of society. Man is not only himself, but is in solidarity with all of his kind. Between the individual and the totality of mankind are set up small groups as supporting elements, though they often turn out obstacles to larger unity of mankind. However, as mentioned earlier, the four varnas have gradually lost their significance, while caste is getting stronger. "The chief features of caste are: (i) Heredity. One cannot change one's caste. (ii) Endogamy. Every member of a caste must marry a member of the same caste and may not marry outside it. (iii) Commensal restriction. Regulations are imposed regarding the acceptance of food and drink from members of other

castes" [Radhakrishnan 1940:371]. Now consider the following. The Universal Declaration of Human Rights, Article 16, says: "Men and women of full age, without limitation due to race, nationality or religion, have the right to marry and found a family. They are entitled to equal rights as to marriage, during marriage and at its dissolution. ...The family is the natural and fundamental group unit of society and is entitled to protection by society and the state." Clearly, the caste system, by restricting marriage and family formation,¹¹ disregards the charter of human rights authenticated by the United Nations, of which India is a member country.

In a word, the past record of the BJP does not inspire much confidence. However, before we come to a conclusion about the merit of the Congress-BJP bipolar politics, let us ascertain the task that lies ahead, and sketch a feasible mode of accomplishing it.

BEYOND CONSERVATISM AND LIBERALISM: UNIVERSAL TRUTHS

Today, what is the enemy number one? An almost unanimous view is that it is communalism – conflicts among religious communities. The long history of India has seen three main approaches to forge religious harmony, which may be called respectively: royal tolerance of diversity, unity-in-god, and religious eclecticism. Emperor Ashoka, and emperor Akbar are the two historic followers of the first path; Mahatma Gandhi is a most distinguished modern preacher of the second; and again, emperor Akbar, the composer of *Din Ilahi*, stands out as a great humanist of all ages who had tried also the third path. Evidently, the results have not been durable.

India has a rich tradition of religious tolerance. It has not only the largest religious literature in the world, but also the largest volume of atheist and materialistic writings among the ancient civilisations. The literature displays a wide variety of views on freedom, tolerance, and equality. In many ways the most interesting articulation of the need for tolerance on an egalitarian basis can be found in the regime of emperor Ashoka during the third century BC. Ashoka commanded a larger Indian empire than any other king in India (including the Mughals and even the British Raj, keeping out the native states). He covered the country with stone inscriptions describing forms of good life and the nature of good government. The inscriptions give special importance to tolerance of diversity. The edict at Erragudi, for example, reads, in part: "[H]e who does reverence to his own

sect while disparaging the sects of others wholly from attachment to his own, with intent to enhance the splendour of his own sect, in reality by such conduct inflicts the severest injury on his own sect" [cited in Sen 1997h:36].

Among the powerful expositors and practitioners of tolerance of diversity in India the great Mughal emperor Akbar, who reigned between 1556 and 1605, is the most illustrious. A Muslim emperor, Akbar sincerely appreciated Hindu philosophy and culture, and he also took much interest in the belief and practices of other religions, including Christianity, Jainism and the Parsee faith. Akbar's court was filled with Hindu and Muslim intellectuals, artists, and musicians. He tried in every way to be non-sectarian and fair in the treatment of his subjects. And, above all, he attempted to establish something of a synthetic religion for India, the *Din Ilahi*, drawing upon different faiths prevailing in the country. He tried to 'combine' the distinct religions of India, incorporating the 'good points' of different religions.¹²

Gandhiji's path of religious tolerance was paved with the sermon of unity-in-god – all religions worship one god; thus we are all brothers and sisters. But he would strongly defend the right to privacy in such matters as food, marriage, and social intercourse. Once he refused to sit down with a Muslim friend for dinner on the argument that eating is an entirely private and personal matter. He disapproved of marriage between Hindus and Muslims as incest [Bose 1998:2094].

Such attempts at inter-religions harmony, not surprisingly, had little lasting impact. For, it seems to us, they do not fulfil two basic requirements, namely, recognition, and identification. First, recognition. Almost all religions suffer from xenophobia; hardly any religion has clear rules or criteria to recognise another faith as legitimate and respectable. Each religion has its own exclusive view of the world and society. Even shared faith in the doctrine of one common god would not help much so long as controversy remains about the specifics of divine revelations. Second, identification. Even society has hierarchy of one kind or another. Hinduism has four varnas and innumerable castes, all ordered in rank. More or less similar divisions can be found in other religious groups as well. Even Gandhiji believed in varnas, and also in castes, albeit to a lesser degree. Other religions do have somewhat similar classifications. But there is hardly any inter-religion correspondence in hierarchies. As a result, one cannot

confidently evaluate the social position of a person of another religion. Such non-correspondence can quickly lead to deep suspicion, rivalry and hostility, specially at times of social and political stress and strain, even though they might have lived in the same village for ages.

If communalism is a primary threat to India's solidarity, so is casteism, which is ubiquitous throughout the country.¹³ Thus the problem is twofold – divisions are located at two levels, namely, inter-religion, and intra-religion. It can be resolved with two principles; as we shall see below, one justifies the universality of domain, while the other enumerates the code of behaviour. Let us illustrate it in concrete terms with reference to two religions, namely, Hinduism and Islam.

The Constitution of India grants freedom of religion to all; so does the Universal Declaration of Human Rights by the United Nations. At the level of polity, therefore, all religions are deemed equal. But what about the civil society? The Hindu philosophy contains diverse views about the world; it has several systems of thought about life, society, and the universe. "In [ancient] India, religion is hardly a dogma, but a working hypothesis of human conduct, adapted to different stages of spiritual development and different conditions of life. Whenever it tended to crystallise itself in a fixed creed, there were set up spiritual revivals and philosophic reactions which threw beliefs into the crucible of criticism, vindicated the true and combated the false. Again and again, ... when traditionally accepted beliefs became inadequate, nay false, on account of changed times, and the age grows out of patience with them, the insight of a new teacher supervenes, stirring the depths of spiritual life. ... It is the intimate relation between the truth of philosophy and the daily life of people that makes religion always alive and real" [Radhakrishnan 1929, vol 1:26]. Appearance of an avatar, a prophet, is thus an integral part of Hindu belief.

Islam has a unique written statement of revelation that details the codes of social life. Although it was meant to be clearly understood by all, evidently, there have been occasions of varying interpretations [Engineer 1999b]. Islamic practice has established traditions for recognition of other faiths. The prophet himself, while concluding a treaty with the Parsis of Bahrain and Oman, accepted them as 'ahl al-kitab' (the people of the Book), although they have not been mentioned in the *Qur'an* as such. Similarly, the third caliph, Uthman ibn Affan, accepted the Berber tribes of

northern Africa as 'people of the Book', although it is doubtful whether they possessed any book at all. "If the Berbers of northern Africa, whom Ibn Khaldun (1332-1383) describes as barbarians...most uncivilised people, could be accepted as 'ahl al-kitab', why not Hindus, inheritors as they are of a high civilisation and culture, possessing a tradition of sophisticated philosophy, metaphysical theories and physical sciences?", asks Engineer (1999a:397). Indeed, Sufi saints such as Abdur Rahim Jan-i-Janan (1699-1781) have concluded that god had sent prophets among the Hindus too, and likened Brahma to Adam and accepted the vedas as revealed books. The Sufis found many parallels to the spiritual endeavour in Islam in the spiritual practice of Hindu yogis. The Sufi concept of 'fan fi Ilah' seems to have been derived from the Buddhist notion of nirvana which predates it. Some Sufis of Gujarat even project the prophet as an 'avatar' of Krishna. There is, thus, a solid common ground for the Hindus and Muslims to embrace each other and recognise as brethren. This is about the issue of inter-religion recognition.

The other problem is to identify individuals in a social context. The Hindu society seems to be subject to inviolable hierarchy. Three percepts of Hinduism, if narrowly interpreted and combined, do, indeed, rot the individual of all freedom; but that would be wrong. Those are the doctrines of respectively, karma, rebirth, and caste as retribution. According to the law of 'karma', there is nothing uncertain or capricious in the moral world, we reap what we sow. The principle of rebirth states that those who possess right knowledge and perform their duties are born again after death for immediate immortality, while those who do not have such knowledge and neglect their duties are reborn again and again on this earth, becoming the prey of death. And, by the law of caste as retribution, "the nature of birth depends on the conduct of man. Those whose conduct has been good will quickly attain some good birth, the birth of a brahmin, a kshatriya, or a vaisya. But those whose conduct is evil will quickly attain an evil birth, the birth of a hog, or dog, or a chandala [scavenger]." This model of eternal cycle of birth and death for the imperfect man is a construction of the later-day Upanishads; there is nothing of this sort in the vedas. The vedas mention neither caste, nor rebirth on this earth, let alone the status at birth as a retribution or prize for the deeds in the previous life. The varnas of the vedas are functional classifications for specialisation of works.

not hereditary tags to be attached to individuals at birth.

Having outlined the basic problem that India faces now, we proceed to find a solution, in principle. At the end we shall ask: can the Congress or the BJP or the two together do it? There are two widely accepted universal truths – human sanctity and human rights – that can provide ground for equality and dignity of all human beings in a fundamental sense. By ordinary perception Hinduism appears as extremely hierarchical, but, at another level, in essence, it holds man in the highest esteem. According to vedic hymns, one reality (ekam sat) realises itself in all variety of existence, including, of course, human beings. The Upanishads confirm the same truth with philosophical analysis of the nature of the self or soul which they call *atman*. What is the nature of the self of man, his central being? Brahman is the ultimate reality, the absolute. And the Upanishads establish the identity of *brahman* and *atman* [Radhakrishnan 1929, vol 1:151-73]. All religions, including Hinduism, thus value man as the highest creation in the universe. This principle underscores the universal dignity of man, regardless of race, ethnicity, colour, gender, or religion. Besides, a religion such as Islam or Christianity that endorses proselytisation assumes a kernel of divinity in every human being. By this doctrine of universal sanctity, then, all human beings have equal measure of dignity as individuals in society.

The other universal truth, we cite, relates to human rights. "The notion of human rights builds on the idea of shared humanity. These rights are not derived from citizenship of any country, or membership of any nation, but taken as entitlements of every human being. The concept of universal human rights is, in this sense, a *uniting* idea" [Sen 1998:40, emphasis in the original]. In broad general sense of entitlements of every human being it is really a relatively new idea, not to be much found either in the ancient west or in ancient civilisations elsewhere. The Universal Declaration of Human Rights, 1948, has codified some of it. Seen in this light a human being, regardless of religion, has a uniform quantum of fundamental rights.

These two universal properties of man have to be understood and respected by everyone. The most effective means of realising and disseminating these truths is to place ourselves vis-a-vis nature. "Nature [according to Upanishadas] is the object of a subject, quite rational and thoroughly intelligible, capable of control and worthy

of love. *It exists for man*" [Radhakrishnan 1929, vol 1:170, emphasis added].

Production of goods and services to satisfy our material needs is essentially a direct interaction with nature. It requires the exercise of reason and rationality to 'control' nature. From our understanding of nature, thus acquired, flows the codes of morality that guide our social life.¹⁴ Participation in production process, therefore, has an instrumental value, for it makes us understand nature, and feel the unity of mankind. To put it in more mundane terms, a growing economy with full employment is an excellent school for practical learning of the value of humanity.

CONCLUSION

Given the country's history, tradition, religion, and philosophy, it is evident that the key problem of India today is, in principle, amenable to solution if appropriate national commitment is made. But neither of the two major parties, Congress and the BJP, is capable of rising to the occasion to confront the interrelated evils of communalism and casteism. Both the parties are drifting together in a groove of obsolete ideas; they can at best tinker at the margin. Under the circumstances, a virtual two-party system with the Congress and the BJP at the forefront will only worsen the situation. The liberal consensus has spawned the conservative consensus. Can it 'roll back' its own alter ego?

Notes

- 1 The Dravidians had come to India, from Mesopotamia, at a much earlier date than the Aryans, and had their civilisation well established in India before the coming of the Aryans [Braudel 1953:213, Pinto 1999, Radhakrishnan 1929, vol 1:75n]. Thus reckoned, large-scale immigration into India had begun at a far more distant time than four millennia ago.
- 2 The idea of civil society emerged in Europe in the 18th century as philosophers and historians sought to come to terms with the capitalist modernity emerging all around them. The Scottish philosophers – Adam Ferguson, Adam Smith, and David Hume – called the new social formation a 'civil society' to distinguish it from the 'savage and barbarous' tribal societies found in the New World. Gellner (1994:5) suggests "the simplest, immediate and intuitively obvious definition" of civil society as "the set of diverse non-government institutions which is strong enough to counterbalance the state and while not preventing the state from fulfilling its role of keeper of the peace and arbitrator between major interests, can nevertheless prevent it from denuding and atomising the rest of the society." He emphasises the negative aspect of civil society, possibly he has in mind the situation that obtained in the former Soviet Union and eastern Europe under communism.

For a different perspective see Eisensteid and Schluter (1998) and Habermas (1989).

Some authors in India consider the civil society as an alternative, and in opposition to, the state that has failed [Chandoke 1998, Gupta 1997, Kothan 1998a, 1998b, Mahajan 1999, Mohanty 1998].

- 3 All references to the Constitution of India are to it as amended to October 5, 1963.
- 4 Of course, the constitution of a country and a declaration of a charter of human rights by the United Nations do not have the same legal or political connotation. Moreover, the very concept of universal human rights has been challenged in some quarters. A number of governmental spokesmen from Asia at the Vienna Conference on Human Rights in 1993 claimed distinctiveness of 'Asian Values' which allegedly have precedence over human rights as commonly understood in the west. For a forceful critique of the position of those spokesmen, see Sen (1996, 1997b, 1998).
- 5 The Constitution cites a category called 'scheduled castes'. It follows immediately that there are other castes that are outside that schedule. Hence, here are two groups of castes. Formally, only Hindus have castes. So, in the mind of the Constitution, there must be a third group consisting of non-Hindus. The society is thus formally divided into at least three parts.
- 6 First, utilitarian equality is the equality that can be derived from the utilitarian concept of goodness applied to problems of distribution. In the simplest case of the 'pure distribution problem', for example, it requires the equality of marginal utility of everyone. According to one interpretation, this equality of marginal utility embodies equal treatment of everyone's interests. Second, the total utility equality shifts the attention from the equality of marginal utility of everyone to that of total utility. This is less counter-factual than the earlier one. Third, Rawls's 'two principles of justice' characterise the need for equality in terms of "primary social goods" – the "things that every rational man is presumed to want". The other three concepts of equality can be found respectively, in the Constitution of India, the Universal Declaration of Human Rights, and Sen (1979, 1999).
- 7 There are two kinds of division of labour. One relates to the detailed classification and separation of tasks which is practised within a firm. The other one is called a social division of labour that separates firms from one another by their specialisation of products. The political clan owes its origin to the latter type of situation.
- 8 The composition of the electorate has changed in favour of the so-called vulnerable section of the population between 1971 and 1996. The participation rate, given the total electorate of a group, is getting higher for the poor, non-literate, dalits, OBCs, rural people, Muslim sections, among the voters. See Alam (1999).
- 9 Huntington (1996:109-20) regards the ongoing changes in the Islamic world as significant as the American Revolution, French Revolution, or Russian Revolution. So he uses the term 'Islamic Resurgence' to describe the phenomenon. He assigns great importance to a demographic feature, namely, the proportion of youth (those between 15 and 24 years of age) in total population. The urge for social

change accelerates, he says, when this ratio approaches or exceeds the critical mark of 20 per cent. Besides, he considers the resurgence as a reaction to what he calls westernisation

10 "The Hindu culture is a product of ages of change wrought by hundreds of generations, of which some are long, stale and sad, and others short, quick and joyous, where each has added something of quality to the great rich tradition which is yet alive, though it bears with it the marks of the dead past" [Radhakrishnan 1929, vol 1:47] Who will identify and cleanse out "the marks of the dead past"?

11 Endogamy is said to be detrimental to the vitality and rigour of the species. See, Darwin (1859:95)

12 Here is an interesting episode about a great grandson of Akbar, Dara Shikoh. Dara, the eldest and favourite son of emperor Shah Jahan, was deeply involved with Hindu philosophy and, with the help of some scholars, he prepared a Persian translation of some of the Upanishads. About a century later, the British governor-general Warren Hastings, in service of the Raj, appointed one N B Hallhead to compile a code of Hindu laws. Hallhead, this task at hand, came to Benaras (Kashi) in search of the Sanskrit literature on Hindu laws, and in the process, he came across an anthology of the ordinances of Manu, in Persian language, a work of none other than Dara Shikoh. It was on the basis of Dara's version of Manu, in Persian language, that Hallhead prepared in English a code of Hindu laws for the British empire [Srivastava 1998:1183]

13 For all pervasiveness of caste in India see Ahmad (1966), Engineer (1999a), Lal (1988:28), Radhakrishnan (1940:376) and Sarkar (1999)

14 Adam Smith (1759:264-342) says that every system of morality is derived from our view of nature and that reason is the faculty that man uses in this process. Smith writes "every system of morality that ever had any reputation in the world has, perhaps, ultimately been derived [T]hey are all of them, in this respect, founded upon natural principles." "From reason we are very properly said to derive all those general maxims and ideas. [R]eason is undoubtedly the source of the general rules of morality."

A similar view can be found in ancient Indian philosophy. Radhakrishnan (1929, vol 2:769) writes "Logic and science, philosophy and religion are related organically. Every fresh epoch in the progress of thought has been inaugurated by a reform in logic. The problem of method involving as it does an insight into the nature of human thought, is of great value. The Nyaya (Gautama's system of philosophy) points out that no stable philosophy can be built except on the foundations of logic. The Vaisheshika (Kanada's system of philosophy) warns us that all fruitful philosophy must take into account the constitution of physical nature. We cannot build in the clouds. Though physics and metaphysics are clearly distinct and cannot be blended, still a philosophic scheme must be in harmony with the results of natural sciences" (emphasis added).

Reason is an innate faculty of cognitive algorithm that operates and evolves in mind.

"What makes reason rational is being right, appropriately digesting and reading the correct data. Reason must be equal to task at hand, avoiding the snares and pitfalls on the way to successful solutions if any exist. What is here meant by 'tasks' and 'success'? The task will ultimately concern life... Success is therefore to be judged by solving the task. The ultimate goal is to achieve a purpose: that is how success operates" (Riedl 1984:13). See also Damasio (1994).

By contrast, following David Hume, Friedrich Hayek (1988) assigns no independent role to reason in the evolution of civilisation, which, he says, is a product of morality alone. And morality, according to him, is prior to, and independent of, reason. We disagree with Hayek on this point, and agree with Damasio, Radhakrishnan, Riedl and Smith.

INDIAN BRANCHES

Schedule 17 – Notes forming part of the Accounts as at 31 March, 1999.

I Summary of Significant Accounting Policies

a) General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country.

b) Transactions involving foreign exchange

- i) Monetary assets and liabilities have been translated at the "Foreign Exchange Dealer's Association of India" exchange rates prevailing at the close of financial year except Foreign Currency Non-Resident account balances which are carried at the rates specified by the Reserve Bank of India or at the spot rates of swap contracts, as applicable.
- ii) Outstanding foreign exchange contracts and contingent liabilities on account of outstanding forward exchange contracts are valued at the contract rates and have not been revalued.
- iii) Income and expenditure items are translated at the exchange rates prevailing as on the date of the transaction.
- iv) Profit or loss on outstanding forward contracts is accounted for on accrual basis.

c) Investments

Investments in Government of India, other approved securities and other investments are valued at lower of cost of acquisition or market value or yield to maturity at rates specified by RBI circular BP.BC.28/21.04.048/98-99 dated 15 April, 1999 and disclosed in accordance with the circular No. BP.BC.9/21.04.018/98 dated 27 January, 1998 and BP.BC.32/21.04.018/98 dated 29 April, 1998

d) Advances

- i) Provisions for doubtful advances have been made to the satisfaction of the auditors.
 - (a) In respect of identified advances, based on a periodic review of advances.
 - (b) In respect of general advances, based on Management's estimate of potential exposure and taking into account guidelines issued by the Government of India and the Reserve Bank of India.
- ii) Provisions in respect of doubtful advances have been deducted from advances to the extent necessary and the excess has been included under "Other Liabilities and Provisions".

e) Fixed Assets

- i) Fixed Assets are accounted at their historical cost except Premises which were revalued as on 31 March 1993 and were accounted for at the values determined by Government Approved Valuers. The surplus on revaluation was credited to Revaluation Reserve.
- ii) Depreciation is provided for on the diminishing balance method at the rates specified in Schedule XIV to the Companies Act, 1956.
- iii) Depreciation in respect of revalued assets is provided for on the revalued amount and charged to the Profit and Loss Account, and an amount equivalent to the accumulated additional depreciation has been transferred from the Revaluation Reserve Account to the Profit and Loss Account.

f) Revenue recognition

Income is recognised on accrual basis except interest on non-performing advances and guarantees/letters of credit commission which are recognised on realisation basis.

g) Staff Benefits

Provision for gratuity is made on basis of an actuarial valuation. Provision for pension benefits is made on an accrual basis. Separate funds for gratuity and pension have been created.

h) Net Loss

The net loss disclosed in the Profit and Loss Account is after:

- a) Provisions for taxes on income in accordance with statutory requirements.
- b) Provisions for doubtful advances.
- c) Adjustments to the value of current investments.
- d) Other usual and necessary provisions.

II. Capital Adequacy Ratio

The Capital Adequacy Ratio of the Bank as at March 31, 1999 as computed under guidelines of the Reserve Bank of India vide Circular No. DBOD No. BP.BC.117/21.01.002/92 dated 22.04.92 and as amended subsequently is 8.56%.

vii) Business (deposits plus advances) per employee	67,902'	78,445'
viii) Loss per employee	519'	1,404'

IV. The Bank has entered into an agreement for settlement of its dues by the owners/landlords of one of its erstwhile premises. Under the agreement the bank has received back its deposit together with interest. The Bank has surrendered its tenancy rights in respect of the premises to the owners/landlords in October 1996 on the basis of the opinion of its solicitors. Moreover, the other co-tenants who had filed claim suits against the bank have signed the consent terms to withdraw the suit in view of the landlord agreeing to re-instate the co-tenants in the new building in terms of the agreement dated 25 February, 1997. The consent terms dated 23 June, 1997 were filed in respect of the same in Mumbai High Court and were taken on record on that date.

V. Previous year's figures have been regrouped/rearranged wherever necessary.

INDIAN BRANCHES

Auditor's Report

We have audited the attached Balance Sheet of the Indian Branches of CREDIT AGRICOLE INDOSUEZ (incorporated in France with limited liability) as on 31st March, 1999 and also the annexed Profit and Loss Account for the year ended on that date.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read together with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account are not required to be and are not drawn-up in accordance with Schedule VI to the Companies Act, 1956. The Accounts are therefore, drawn-up to conform with Forms A and B (Revised) of the Third Schedule of the Banking Regulation Act, 1949. Subject to the foregoing observations, we report that in accordance with sub-section (3) of Section 30 of the Banking Regulation Act, 1949:

- a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory;
- b) The transactions of the Indian Branches which have come to our notice have been within the powers of the Indian Branches of the Bank;
- c) In our opinion, proper books of accounts, as required by law, have been kept by the Indian Branches of the Bank so far as appears from our examination of those books;
- d) The Balance Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of account;
- e) In our opinion and to the best of our information and according to the explanations given to us the said accounts give the information required by the Companies Act, 1956 in the manner so required, for Banking companies and read together with the notes, give a true and fair view:
 - (i) In the case of the Balance Sheet of the state of affairs of the Indian Branches of the Bank as at 31st March, 1999 and
 - (ii) In the case of the Profit and Loss Account, of the loss for the year ended on that date.

Indian Macro-Economic Data Base in a Consistency Accounting Framework (1950-51 to 1997-98) – II

Identifying Empirical Patterns and Regularities

M J Manohar Rao
Archana P Samant
Nina L Asher

Despite certain minor problems of definitions and measurements left unresolved by the earlier exercise on Indian macro-economic data base consistency (reported in the previous issue of EPW), the resulting integration helped us to detect the structural changes that have occurred in the real and financial sectors of the Indian economy over the entire sample period, in general, and between the pre- and post-liberalisation phases, in particular. In such a context, we have identified many important empirical patterns and regularities, notably the existence of business cycles, the counter-cyclical nature of inflation, the twin deficits problem, the impact of absorption on reserves, the evolution of the debt-income ratio, the relationship between real interest rates and growth, the sustainability of the fiscal stance, amongst others, which could act as theoretical guideposts for the formulation of issues in the role and conduct of macro-economic stabilisation policy.

I Introduction

A major and long pending need with respect to methodological improvements in the Indian macro-economic data base is to bring about harmonisation of all the four major accounts of the three major specialised statistical systems (i.e., National Accounts Statistics of the Central Statistical Organisation (CSO), Balance of Payments accounts of the Reserve Bank of India (RBI), monetary and banking data of the RBI, and fiscal data pertaining to government finance statistics and budget financing operations of the ministry of finance, government of India) and thereby promote the integration of various economic and related statistics.

In such a context, an attempt was made in the first part of this study (published in the earlier issue of *EPW*) to present a comprehensive and consistent set of macro-economic data for the Indian economy by integrating these four accounts for the 48-year period from 1950-51 to 1997-98. This was done by specifying an alternative system of presenting the data generated in the national and related accounts in the form of a consistency accounting framework which is a flexible way of rearranging the data in a matrix form elaborating the linkages between sources and uses of funds as well as between institutional sector accounts. It was seen that such an accounting framework ensured the numerical consistency of data drawn from different sources in a way that both the sectoral as well as economywide budget constraints were simultaneously satisfied.

Despite certain minor problems of definitions and measurements left unresolved

by the earlier exercise, the success achieved by us in integrating the basic time-series on national accounts with related aggregates has helped us in this paper to depict the growth of, both, the real and financial sectors of the Indian economy, as also its structural changes, over the entire sample period, in general, and between the pre- and post-liberalisation phases, in particular. In such a context, the resulting identification of empirical patterns and regularities should facilitate translation of certain important theoretical constructs on structural adjustment problems into various policy relevant solutions and inter-relationships.

II What Do the Data Reveal? Identifying Empirical Patterns and Regularities

While no detailed econometric analysis is undertaken here, a few observations, based on the empirical patterns and regularities detected in the statistical time series contained in Table 3*,¹ as well as in the supplementary information provided in Appendix I, are in order.

COMPONENTS OF GDP EXPENDITURE

Equating the components of the first row and first column of Table 1* describes how the sum of goods and services that are domestically produced (Y_{mp}) and imported (Z), i.e., the total available goods and services for final use, are disposed of between public and private consumption (C_g and C_p), public and private investment (I_g and I_p) and exports (X). The ensuing results, in the form of five-year periodwise averages, are provided in Figure 1 where

each stacked bar graph indicates the percentage share of the above five expenditure components in ($Y_{mp}+Z$) for the corresponding period.

The results indicate that there are three features which distinguish the post-liberalisation period (1991-95) from the earlier phases: (i) For the first time ever, the share of C_p , which had increased ceaselessly from 1951-55 onwards, declined, albeit marginally, to 13.1 per cent partly as a result of the fiscal austerity measures adopted; (ii) The share of X surged to a peak of 9.4 per cent from its earlier level of 6.4 per cent as an outcome of external real sector liberalisation; and (iii) There was a marginal increase in the share of I_p which enabled it to reach an all-time high of 14.1 per cent. Apart from these, the trends in the other two variables were not dissimilar from those observed earlier, what with C_p continuing to decline monotonically as before reaching a trough of 55.2 per cent; and I_p , after peaking at 8.9 per cent during 1976-80, fluctuating around a declining trend to reach its current level of 8.1 per cent.

COMPONENTS OF NATIONAL DISPOSABLE INCOME APPROPRIATION

Adding together the second and third rows as well as columns of Table 1* and equating their sums describes how gross national disposable income (GNDI), i.e., GDP at market prices plus factor incomes and current transfers from abroad, are disposed of between total consumption ($C = C_g + C_p$), total savings ($S = S_g + S_p$) and total net investment income ($INV = INV_{gc} + INV_{pc}$). The results are provided in Figure 2 where the first pie diagram indicates the share of these components

in GNDI for the seven-year pre-liberalisation period (1984-91) while the second pie diagram refers to the seven-year post-liberalisation phase (1991-98).

The results indicate that there are two positive features which characterise the post-liberalisation phase: (i) There was a distinct fall in the share of consumption from 78.1 to 75 per cent which is the prime reasons for the fall in absorption and the consequent rise in reserves during this phase; and (ii) To mirror this fall, the share of gross savings increased from 21.1 to 23.9 per cent reflecting the impacts of the financial liberalisation measures. Coming to the negative aspect, we realise that total net investment income increased from 0.7 per cent to 1.1 per cent which is very disconcerting because if such resource outflows from government and private sector

incomes continue to increase unabatedly, then they could in future simultaneously decrease both savings and consumption. While this has not yet happened, the leading indicator of such a possibility is protracted stagnation and demand recession and it is alarming to note that we currently seem to be in the grip of precisely such a malaise.

THE TWIN DEFICIT PROBLEM

Much of the theoretical debate on structural adjustment focuses attention on the relationship between the gross fiscal deficit (GFD) and the current account deficit (CAD). Decomposing equation (23*) into its basic components, i.e., $I = I_g + I_p$ and $S = S_g + S_p$, we have

$$(S_g - I_g) + (S_p - I_p) = -CAD \quad (1)$$

Based upon the above equation which indicates that improvements in the CAD can take place only if sectoral savings rise relative to sectoral investment, Dornbusch and Helmers (1988) concluded forcefully that policies which do not have any effect on savings cannot be expected to improve the external balance. However, equation (23*) can also be written in terms of the linkages between the GFD and the CAD as follows:

$$I_p = S_p - (I_g - S_g) + CAD \\ = S_p - GFD + CAD \quad \dots(2)$$

which indicates that increases in external savings, i.e., the CAD, offset public sector dissaving thereby preempting the crowding out of private sector investment. Now if the government fiscal deficit is

corrected, will that reduce the CAD? Based upon the results of Feldstein and Horioka (1982), the answer is 'No' because their evidence indicates, just as forcefully, that cutting the fiscal deficit (and thereby increasing the national savings rate) will only increase investment with very little impact on the CAD. Thus, whether changes in the savings rate are reflected primarily in the external balance (Dornbusch and Helmers) or in investment levels (Feldstein and Horioka) becomes a policy issue of very great practical relevance.

To ascertain the validity of the above two propositions in the Indian context, we initially correlated five-year period averages of savings rates (S/Y) on their corresponding five-year period averages of investment rates (I/Y) and the resultant plot with the nine scatter points (one for each of the five years of the 45-year period 1951-52 to 1995-96) is presented in Figure 3. Regressing (I/Y), which as per the Feldstein-Horioka hypothesis is the dependent variable on (S/Y) and obtaining the corresponding fitted values of the investment rates for the entire sample period yields the flat upward sloping bold line in the figure which indicates a very high correlation ($R^2 = 0.97$) between savings and investment rates.

We then correlated five-year period averages of savings rates with their corresponding current account deficit rates (CAD/Y) and the resultant scatter plot is presented in Figure 4. Regressing (CAD/Y) which, as per the Dornbusch-Helmers hypothesis, is the dependent variable on (S/Y), we obtained the fitted values of CAD rates depicted by the flat bold line in the figure which indicates the absence of any correlation ($R^2 = 0.00$) between these two variables. Ironically enough, it is interesting to note that, if we disregard the initial data point (for the period 1951-55), there is almost a near perfect inverse relationship between savings and CAD rates ($R^2 = 0.99$) for the 20-year period 1956-75 (indicated by the initial downward sloping dashed line), which however breaks down completely ($R^2 = 0.04$) for the subsequent 20-year period 1976-95 (indicated by the second downward sloping dashed line), what with two near identical savings rates (21.6 per cent during 1976-80 and 21.9 per cent during 1986-90) being related to diametrically opposing CAD rates (0.18 per cent during 1976-80 and 2.5 per cent during 1986-90). Thus, it is clear that, in the Indian context, the Dornbusch-Helmers proposition can be rejected while the Feldstein-Horioka proposition stands vindicated.

FIGURE 1: COMPONENTS OF GDP EXPENDITURE

FIGURE 2: COMPONENTS OF NATIONAL DISPOSABLE INCOME: APPROPRIATION

ABSORPTION AND RESERVES

As shown in equation (25*), there is an inverse relationship between absorption (A) and reserve expansion (ΔR^*) according to which, if total resources as well as the flow demand for money remains fixed, any increase (decrease) in absorption will automatically decrease (increase) reserves on a one-to-one basis. While the consistency check provided in Table 7* established the above proposition numerically in accounting terms, we need to examine more precisely the nature of empirical regularities between these two variables by relating movements in absorption to changes in reserve accretion.

To do so, we initially defined both these variables in terms of GDP at market prices (Y_{mp}) in an attempt to show that excess relative absorption, i.e. the excess of domestic absorption over GDP, is inversely related to reserve accretion.² The results, in the form of a line graph over the entire sample period, are provided in Figure 5.1 where the light gray line denotes $(A/Y) - 1$, i.e. the ratio of excess absorption to Y_{mp} , and the dark black line indicates $\Delta R^*/Y$, i.e. reserve accretion (depletion) as a fraction of Y_{mp} .

The results clearly bear out the inverse relationship between these two variables over the sample period and it is seen, by way of example, that the excess absorption of 2.8 per cent witnessed in 1990-91 is faithfully mirrored by a reserve depletion of 0.8 per cent, while the turnaround in 1991-92, after devaluation which saw reserve accretion increase to 1.2 per cent, is explained by the fact that relative domestic absorption decreased to barely 0.5 per cent as a result of the expenditure reduction policies initiated that year.

We then compared the empirical regularity between conventional relative absorption, i.e. $A/(Y^* + \Delta F)$, and absolute reserve accretion, i.e. ΔR^* , for the seven-year pre-liberalisation period 1984-91 and the corresponding seven-year post-liberalisation phase 1991-98. The results are provided in Figure 5.2 where the 14 scatter points denote relative absorption and the corresponding reserve accretion for all these years. We then estimated two simple equations in such a context by regressing ΔR^* on $A/(Y^* + \Delta F)$, initially for the pre-liberalisation period (indicated by the AA' line in the figure), and then for the post-liberalisation phase (indicated

FIGURE 3: FELDSTEIN-HORIOKA PROPOSITION: VALIDATED

FIGURE 4: DORNBUSCH-HELMERS PROPOSITION: INVALIDATED

by the BB' line), and the estimated equations (with t-values in parentheses) are given below:

Pre-Liberalisation Phase (1984-91):

$$\Delta R^* = 476348 - 476518 [A/(Y^* + \Delta F)];$$

(9.5)

$$R^2 = 0.95 \quad (3.1)$$

Post-Liberalisation Phase (1991-98):

$$\Delta R^* = 937186 - 936056 [A/(Y^* + \Delta F)];$$

(6.0)

$$R^2 = 0.88 \quad (3.2)$$

The above results indicate that there is a distinct structural break in the relationship between these two variables with the impact of a percentage point increase in relative absorption on reserve depletion significantly doubling from Rs 4,765 crore before liberalisation to Rs 9,360 crore after liberalisation. This increasing sensitivity of reserve fluctuations on absorption levels implies that it is absolutely imperative to contain any further increases in absorption if future reserve accretion targets are to be achieved.

SOURCES AND DISPOSITION OF GOVERNMENT INCOME

The basic relationship that exists between government revenue and government current uses is given by equation

(7*) which can be re-written as follows:

$$(OS_g + D_g) + (Ti - Sb) + (Td + NTR_{eg} - INV_{ge}) = C_g + (NTR_{gp} + INT_{gp}) + S_g \quad (4)$$

where the first term in parentheses on the left-hand-side of equation (4) denotes the share of the government in GDP at factor cost, the second term indicates net indirect taxes, and the last term is the sum of total direct taxes plus net receipts from the external sector, i.e., net transfers from abroad less investment income payable to the external sector by the government. Thus, the sum of these three components represents total government income. This is linked to the right-hand-side of the above equation (indicating the disposition of income) which specifies the three components constituting total government current uses, where the term in parentheses is the sum of net transfers to the private sector plus interest payments on the internal debt.

Based upon the above identity, we initially describe the variations that have taken place in the sources of government income over the entire sample period and the results, in the form of five-year period-wise averages, are provided in Figure 6.1 where each stacked bar denotes the share

of total government income, as well as its component sources, in GDP at market prices for the corresponding period. These indicate that there are three features which distinguish the post-liberalisation period (1991-95) when the share of government income increased to an all-time high of 23.9 per cent of GDP: (i) There was a surge in the share of the operating surplus of the government to 6 per cent over its previous level of 4.5 per cent in 1986-90, due to the productivity-enhancing and cost-cutting measures initiated by the government; (ii) The share of direct taxes (inclusive of net receipts from abroad), which had declined steadily from 1976-80 onwards, increased substantially to 3.3 per cent from its earlier level of 2.7 per cent in 1986-90, reflecting the sustained attempts to increase the tax base, improve tax compliance, and strengthen the tax collection mechanism; and (iii) For the first time ever, the share of net indirect taxes in GDP, which had increased continuously from 1951-55 onwards, declined from 10.9 per cent during 1986-90 to 10.1 per cent, as a result of measures to rationalise the tariff and excise/import duty structures and dismantle protective barriers.

We now describe the variations that have taken place in the disposition of total government income – the components on the right-hand-side of equation (4) – over the entire sample period and the results, once again in the form of five-year periodwise averages, are provided by the stacked bar graphs in Figure 6.2. These indicate that the only positive feature which characterises the post-liberalisation phase is that the share of C_g , which had increased ever since 1951-55, seems to have stabilised at around 14.7 per cent of GDP. This containment was, however, overwhelmed by the fact that the share of net transfers from the government to the private sector (inclusive of interest payments) increased to 7.4 per cent of GDP from its previous level of 6.2 per cent during 1986-90. As a result, despite the rise in the share of government income, public sector savings fell to an all-time low of 1.66 per cent of GDP, implying that a reduction in government current expenditures is no longer a sufficient condition for fiscal stabilisation. This rapid increase in interest payments suggests that, unless we control the explosive growth of internal debt witnessed since liberalisation (14 per cent per year since 1991), the government could be forced into a Ponzi scheme where its entire market borrowings would need to be used just for paying off interest obligations on its internal debt.³

FIGURE 5.1: ABSORPTION AND RESERVES - I

FIGURE 5.2: ABSORPTION AND RESERVES - II

SOURCES AND DISPOSITION OF PRIVATE SECTOR INCOME

The basic relationship that exists between private sector revenue and private sector current uses is given by equation (11*) which can be re-written as follows:

$$(W + II + D_p) + (NTR_{gp} + INT_{gp}) + (NTR_{ep} + NFP_{ep} - INV_{pe}) = C_p + Td + S_p \quad \dots(5)$$

where the first term in parentheses on the left-hand-side of equation (5) denotes the share of the private sector in GDP at factor cost, the second term is the sum of net transfers from the government to the private sector inclusive of interest payments on the internal debt, and the last term denotes net receipts from the external sector, i.e., net transfers from abroad plus net factor income from abroad less investment income payable to the external sector by the private sector. Thus, the sum of these three components represents total private sector income. In a similar fashion, the right-hand-side of the above equation indicates the three components which constitute total private sector current uses.

Based upon the above identity, we initially describe the comparative changes that have occurred in the sources of private

income over the 14-year period 1984-98 and the results are provided in Figure 7.1 where the first pie diagram indicates the share of each of these sources in total private sector income (Y_p) for the seven-year pre-liberalisation period (1984-91) while the second pie diagram refers to the seven-year post-liberalisation phase (1991-98). An examination of the trends indicates that the only distinguishing feature that characterises the post-liberalisation period is the fact that, despite resource outflows on account of private sector external liabilities (investment income) increasing from 0.34 per cent to 0.70 per cent of GDP, net receipts from the external sector increased more than threefold from 0.53 per cent to 1.80 per cent of GDP, entirely because net private transfers increased from 0.94 per cent to 2.59 per cent of GDP. The share of wages and profits of the private sector in GDP reached a new low of 73.8 per cent thereby continuing a declining trend which has been exhibited right from 1950-51 itself. Despite this fall, the increase in net transfers from the government (inclusive of interest payments) to a new high of 7.5 per cent of GDP pushed up the share of total private income to 88.9 per cent of GDP from its pre-liberalisation level of 86.9 per cent.

We now examine the changes that have taken place in the disposition of total private sector income – the components on the right-hand-side of equation (5) – over these two seven-year periods and the results, once again in the form of a pie chart, are provided in Figure 7.2. If any particular feature here has to be singled out, then it is the fact that the post-liberalisation phase was marked by the largest ever transfer of resources from the private to the government sector in the form of direct taxes whose share increased to 3.9 per cent of GDP from its pre-liberalisation level of 2.9 per cent. While it is true that the share of private consumption fell to a new low of 62 per cent of GDP from its pre-liberalisation level of 64.6 per cent, this decline only perpetuated the trend visible since the 1950s. Be that as it may, the fall in the share of C_p , coupled to the stability in the share of C_g , is the single most important contributing factor to the reduction in relative absorption, and the subsequent increase in reserve accretion, witnessed during the post-liberalisation phase. This fall in the consumption propensity was mirrored by a rise in the private savings rate which increased from 19.3 per cent during the pre-liberalisation phase to 23 per cent – a substantial increase of 3.7 percentage points which, however, has been surpassed in earlier periods, notably during 1986-90 when private savings rose to 20.1 per cent from its earlier level of 15.6 per cent during 1981-85.

FINANCING CURRENT ACCOUNT DEFICITS

From equation (16*), we realise that the current account deficit (CAD) can be written as:

$$CAD = \Delta F_g + \Delta F_p - \Delta R^* \quad \dots(6)$$

which indicates that a CAD must be financed either by increasing official capital flows (ΔF_g), or by increasing private capital flows (ΔF_p), or by running down international reserves (ΔR^*).

Based upon the above identity, we describe the variations that have taken place in the patterns of financing CADs over the entire sample period and the results, in the form of five-year periodwise averages, are provided in Figure 8, where the three bars denote the percentage of CAD financed by these three sources over the corresponding period. These indicate that the financing share of official capital flows, after peaking at 44.3 per cent of CAD in 1976-80, declined over the next decade, although during the post-liberalisation phase, it did increase marginally to finance about 56 per cent of the CAD. The reverse was true of private capital flows which, after manifesting a virtual capital

FIGURE 6.1: SOURCES OF GOVERNMENT INCOME

FIGURE 6.2 DISPOSITION OF GOVERNMENT INCOME

flight to the extent of -305 per cent of CAD during 1971-75, increased steadily to reach 141 per cent of CAD during the post-liberalisation phase. As far as variations in reserves are concerned, it is seen that the initial reserve depletion witnessed during the 1950s gradually reversed itself to reach a reserve accretion level of 409 per cent of CAD during 1976-80. Thereafter, the 1980s were once again characterised by ever increasing reserve losses, culminating in virtual reserve exhaustion and the subsequent devaluation of July 1991. However, this trend was reversed completely during the post-liberalisation phase which witnessed reserve accretion to the extent of 97 per cent of CAD.

FINANCING PUBLIC SECTOR INVESTMENT

From equation (9*), the financing constraint for public sector investment (I_g) is given by:

$$I_g = S_g + \Delta DC_g + \Delta B + \Delta F_g \quad \dots(7)$$

which indicates that government savings plus net borrowings is identical to the (physical) assets acquired by the government during the accounting period.

Based upon the above identity, we describe the variations that have taken place in the patterns of financing I_g over the entire sample period and the results, in the form of five year periodwise averages, are provided in Figure 9, where each

stacked bar denotes the percentage of I_g financed by these four sources over the corresponding period. These indicate that the financing share of S_g declined from 45 per cent of I_g during the 1960s and 1970s to 25 per cent during the 1980s and still further to 18 per cent during 1991-95. Virtually like a mirror image, the financing share of ΔB increased from 16 per cent of I_g during the 1960s and 1970s to 28 per cent during the 1980s and still further to an unprecedented 45 per cent of I_g during 1991-95. This complete reversal of the financing shares is a matter of serious concern and is a trend that calls for 're-switching' as soon as possible. Finally, it is seen that while the financing share of ΔF_g has remained virtually unchanged over the last 20 years at around 7 per cent of I_g ; that of ΔDC_g (indicative of monetary accommodation) declined substantially from 42 per cent of I_g during 1986-90 to 30 per cent during 1991-95, reflecting the relatively tight monetary stance adopted by the RBI during the initial phases of liberalisation.

SOURCES OF PRIVATE SECTOR FUNDS

The basic relationship that exists between the sources of private sector funds and the portfolio distribution of private sector assets is given by equation (13*):

$$S_p + \Delta DC_p + \Delta F_p = I_p + \Delta B + \Delta M \quad \dots(8)$$

which states that private sector savings plus borrowings equals private sector asset acquisition in the form of money, fixed investment and net lending to the government.

Based upon the above identity, we initially describe the comparative changes that have occurred in the funding pattern of the private sector over the 14-year period 1984-98 and the results are provided in Figure 10.1 where the first pie diagram indicates the share of each of these three sources in private sector funding for the seven-year pre-liberalisation period (1984-91) while the second pie diagram refers to the seven-year post-liberalisation phase (1991-98). An examination of the trends indicates that the two most distinguishing characteristics of the post-liberalisation period is the increase in the private sector savings rate from 19.3 per cent of GDP during 1984-91 to 23 per cent during 1991-98; as well as the increase in private capital flows from 1.4 per cent of GDP during 1984-91 to 2.1 per cent during the post-liberalisation phase. Both these increases more than offset the reduction in the private sector 'credit entitlement' (ΔDC_p /GDP) which decreased from 4.4 per cent of GDP during the pre-liberalisation phase to 3.8 per cent during 1991-98. Overall, the share of private sector funds in GDP increased from 25.2 per cent of GDP to 28.9 per cent during the post-liberalisation phase.

PRIVATE SECTOR PORTFOLIO DISTRIBUTION

Based upon the right-hand-side of equation (8), we now describe the comparative changes that have occurred in the portfolio composition (i.e., asset acquisition in the form of money, fixed investment and net lending to the government) of the private sector over the 14-year period 1984-98 and the results are provided in Figure 10.2 where, as before, the first pie diagram indicates the portfolio distribution over the seven-year pre-liberalisation period (1984-91) while the second pie diagram refers to the seven-year post-liberalisation phase (1991-98).

An examination of the trends indicates that the most distinguishing characteristic of the post-liberalisation period is the increase in the private sector investment rate from 14.1 per cent of GDP during 1984-91 to 16.8 per cent during 1991-98. Despite this, however, the private sector savings-investment gap increased from 5.2 per cent of GDP during the pre-liberalisation phase to 6.2 per cent during the post-liberalisation period implying, from equation (1), that the private sector was funding a still higher proportion of the public sector investment-savings gap. The tight monetary stance adopted by the RBI during the initial stages of liberalisation

reduced the share of money (ΔM) in the assets of the private sector from 8.3 per cent of GDP during 1984-91 to 7.8 per cent during 1991-98; while the excessive reliance on market borrowings by the government increased the share of government bonds (ΔB) in the assets of the private sector from 2.8 per cent of GDP to 4.2 per cent during the post-liberalisation phase. Overall, the ratio of $I_p:(\Delta M + \Delta B)$ changed marginally from 56:44 during 1984-91 to 58:42 during 1991-98. Considering that this ratio, which indicates the share of physical (productive) to financial (non-productive) assets in the portfolio composition of the private sector, is related to overall economic growth, the government has to ensure that investment is not crowded out from the portfolio of the private sector by excessive money or bond-financing.

GROSS FISCAL DEFICIT, INTEREST PAYMENTS AND THE PRIMARY DEFICIT

The gross fiscal deficit ($GFD = I_g - S_g$) can be decomposed into interest payments on the internal debt (INT_{gp}) and the primary deficit (surplus, if negative). Thus, we have:

$$GFD = INT_{gp} + PD \quad \dots(9)$$

where PD is the primary deficit which, from equations (7*), (8*) and (10*), is given by:

$$PD = I_g + [C_g + NTR_{gp} + INV_{ge}] - [(OS_g + D_g) + (Ti - Sb) + Td + NTR_{eg}] \quad \dots(10)$$

Based upon equation (9), we describe the variations in its variables over the 45-year sample period and the results, in the form of five-year periodwise averages, are provided in Figure 11 where each stacked bar expresses the GFD, as well as its two components, as percentages of GDP at market prices for the corresponding period. These indicate that the post-liberalisation phase was marked by a reduction in the primary deficit to 3.1 per cent of GDP which, being the highest recorded decrease over the entire sample period, is a very significant fiscal correction. However, this was largely offset by the increase in interest payments to 4.2 per cent of GDP as a result of which the GFD ratio declined, only marginally from 7.8 per cent of GDP during 1986-90 to 7.5 per cent during 1991-95. However, the fact remains that it is for the first time since 1966-70 that the fiscal deficit ratio actually declined. In this context, it needs to be mentioned that the results of Rao and Nallari (1995) indicate that fiscal erosion in the Indian economy due to collection lags – the so-called Olivera-Tanzi effect – was to the extent of almost 0.6 per cent of GDP over the 1980s, implying that the GFD ratio could have

been that much lower in the 1990s had appropriate policy measures been taken.

CAD, INVESTMENT INCOME AND THE NON-INTEREST CURRENT ACCOUNT

Similarly, the CAD can be decomposed into total net investment income ($INV = INV_{ge} + INV_{pe}$) and the non-interest current account deficit (surplus, if negative). Thus, we have:

$$CAD = INV + NICA \quad \dots(11)$$

where NICA is the non-interest current account which, from equation (15*), is given by:

$$NICA = Z - [X + NTR_{eg} + NTR_{ep} + NFP_{ep}] \quad \dots(12)$$

Based upon equation (11), we describe the changes that have taken place in sectoral investment income and the NICA and the results are provided in Figure 12 where the first pie diagram denotes the share of these components in the CAD for the seven-year pre-liberalisation period (1984-91) while the second pie diagram refers to the seven-year post-liberalisation phase (1991-98). These indicate that, apart from the reduction in the CAD to 1.29 per cent of GDP during 1991-98, there was a distinct change in its composition as well. While for the period 1984-91, INV accounted for 30 per cent of the CAD (0.69 per cent of GDP) and NICA the remaining 70 per cent (1.64

per cent of GDP); for the subsequent period, INV was 86 per cent of CAD (1.11 per cent of GDP) while the share of NICA dropped to just 14 per cent (0.18 per cent of GDP) implying a very significant external correction. A component-wise examination indicates that, while INV_{ge} remained more or less stable at around 0.40 per cent of GDP across these periods, INV_{pe} (indicating private sector resource outflows) more than doubled from 0.34 per cent of GDP to 0.71 per cent of GDP which, as mentioned earlier, could be one of the many possible reasons for the current state of depressed demand in the economy.

THE THREE GAPS IN PRACTICE

Having examined the GFD and CAD individually, we now analyse contemporaneous movements in these two gaps by invoking the third gap, i.e. the private sector savings-investment gap, which effectively closes the model. This is done by re-writing equation (2) as:

$$GFD = (S_p - I_p) + CAD \quad \dots(13)$$

which indicates that the gross fiscal deficit of the government, i.e. $I_g - S_g$, must be financed either by an excess of private sector savings over investment, or by a current account deficit.

Based upon equation (13), we now describe variations in these three gaps over the entire sample period and the results are presented in Figure 13. These indicate

FIGURE 7.1: SOURCES OF PRIVATE SECTOR INCOME

FIGURE 7.2: DISPOSITION OF PRIVATE SECTOR INCOME

FIGURE 8: FINANCING CURRENT ACCOUNT DEFICITS

FIGURE 9: FINANCING PUBLIC SECTOR INVESTMENT

FIGURE 10.1: SOURCES OF PRIVATE SECTOR FUNDS

FIGURE 10.2: PRIVATE SECTOR PORTFOLIO DISTRIBUTION

that, if we disregard the first half of the 1950s, there were only three occasions in the mid-1970s when, because of current account surpluses, $(S_p - I_p)$ exceeded the GFD. Later on, however, there was a relentless increase in the GFD and the CAD which culminated in 1990-91 when they both peaked at 9.98 per cent and 3.24 per cent of GDP, respectively. More alarming was the fact that $(S_p - I_p)$ for that year was 6.74 per cent of GDP, implying that it was financing just about 68 per cent of the GFD, with the remaining 32 per cent – an abnormally high fraction – being financed by the CAD. Thereafter, because of the ‘shock therapy’ type of stabilisation measures imposed, both the GFD and the CAD reduced instantaneously and significantly to 7.43 per cent and 0.36 per cent of GDP in 1991-92. However, as per the latest indicators, these gaps have increased to 7.97 and 1.74 per cent of GDP in 1997-98, although fortunately enough $(S_p - I_p)$ continues to finance about 78 per cent of the GFD, implying that although the current fiscal and external stances are economically vulnerable, they are still financially viable.

REAL EXCHANGE RATES AND CADs

While we have examined the co-movements in these variables, any effort to study the relationships between the three gaps more systematically must analyse the factors which caused these deficits in the first place. In this context, the basic proximate determinant of the CAD/GDP ratio is the real exchange rate (RER) and, as such, we describe variations in these two variables for each year of the sample period and the results are presented in Figure 14.⁴

The results are interesting because they do establish the fact that the RER and the CAD/GDP ratio are inversely related to a very large extent. Thus, the pegging of the nominal exchange rate from 1950-66 led to a steady appreciation in the RER, as a result of which the CAD exhibited an increasing trend. In this context, it is seen that the 34 per cent nominal devaluation in 1966-67 (resulting in a 23 per cent real devaluation) caused the CAD to fall sharply only from 1967-68 onwards while on the other hand, the 36 per cent nominal devaluation of 1991-92 (resulting in an identical 23 per cent real devaluation) brought about an instantaneous CAD compression. Based upon equation (1), which specifies that the GFD is also a proximate determinant of the CAD, leads us to hypothesise that, while a real devaluation is a necessary condition for an external correction, sufficiency is ensured provided there is an accompanying fiscal correction in the form of a reduction in the GFD. If this is missing, as it was in 1966-67, then

even a sufficiently strong real devaluation might, along the lines of the so-called 'J-curve' effect, take a much longer time to bring about a reduction in the CAD. Finally, it is seen that the existing RER of Rs 27.18/\$ in 1997-98 is even lower than the corresponding RER of Rs 27.45/\$ in 1992-93 which could explain the rise in the CAD of late.

STRUCTURE OF INTEREST RATES

To assess the sustainability of the fiscal stance, we need to initially examine the structure of interest rates in the Indian economy which would be indicative of the underlying monetary stance. The three rates selected for the purpose are the one-year deposit rate (i_1); the implicit interest rate on domestic debt (i_d) defined as the average ratio of interest payments on domestic debt (INT_{gp}) to total (central and state government) internal debt (ID), i.e., $i_d = INT_{gp}/ID$; and the implicit interest rate on external debt (i_e) defined as the average ratio of interest payments on external debt (INT_{ge}) to central government external debt (ED), i.e., $i_e = INT_{ge}/ED$. All these three rates have been plotted in Figure 13 for the entire sample period.

These indicate that: (i) Although there was some volatility in i_d , it remained below 4 per cent until the second oil price shock of 1979-80. Thereafter, it increased continuously, overtaking i_1 in 1988-89, and currently stands at 15.6 per cent thereby imposing a staggeringly high interest burden on the government; and (ii) Apart from the sharp increase to 3.3 per cent in 1973-74 due to the first oil price shock which sent world interest rates soaring, i_e hovered around 2 per cent until 1981-82. Thereafter, it increased sharply and currently stands at 8.5 per cent. However, it needs to be noted that after liberalisation, all the three rates have moved almost in sync by exhibiting near contemporaneous peaks and troughs. While the difference between i_1 and i_e has narrowed down, reflecting the increasing integration between Indian and world capital markets, that between i_1 and i_d seems to be on the rise as a result of continued market borrowings. Currently, the differential between i_d and i_e is almost 7.1 per cent which implies that unless the expected exchange rate depreciation is of this order of magnitude, it would be cheaper for the government to borrow from external rather than domestic sources.

EVOLUTION OF THE DEBT-INCOME RATIO

It is now possible to analyse the fiscal stance by examining the relationship between real interest rates and growth. In such a context, let d denote the ratio of internal debt to GDP at market prices, i.e.,

FIGURE 11: GROSS FISCAL DEFICITS, INTEREST PAYMENTS AND PRIMARY DEFICITS

FIGURE 12: CURRENT ACCOUNT DEFICITS, INVESTMENT INCOME AND THE NON-INTEREST CURRENT ACCOUNT

FIGURE 13: THE THREE GAPS IN PRACTICE

FIGURE 14: CURRENT ACCOUNT DEFICITS AND REAL EXCHANGE RATES.

FIGURE 15: STRUCTURE OF INTEREST RATES

FIGURE 16: EVOLUTION OF THE DEBT-INCOME RATIO

FIGURE 17: REAL INTEREST RATES AND ICORS

FIGURE 18: REAL INTEREST RATES AND GROWTH

$d = ID/GDP$. Then its evolution over time is given by:

$$\Delta d = (r - g)d + x \quad \dots(14)$$

where Δd is the change in the debt-income ratio, r is the real rate of interest paid on the internal debt, i e, the implicit interest rate on internal debt (i_d) less the inflation rate, g is the growth rate of real output, and x is the primary deficit to income ratio, i e, $x = PD/GDP$.

In Figure 14, we have plotted the debt-income ratio (d) for each year of the sample period, the corresponding differential between the real interest rate and the growth rate ($r-g$), as well as the primary deficit-income ratio (x). The results indicate that, for the first time since 1955-56, the real rate of interest exceeded the real growth rate in 1996-97 by 1.5 percentage points, and by almost 5 percentage points in 1997-98. The results also indicate that movements in the debt-income ratio are closely related to its proximate determinants given by equation (14). For example, it is seen that the secular decline in d during the period 1959-77 was due to excessively negative levels of $(r-g)$ because of 'financial repression'; while high values of x were responsible for the subsequent increase in d over the period 1977-94. What is worrisome about the current scenario is that from now on the positive values of $(r-g)$ would reinforce the existing positive primary deficits leading to an explosion in the debt-income ratio, implying that a fiscal correction in the form of a primary surplus is urgently required.

REAL INTEREST RATES AND ICORS

Because fiscal sustainability is critically associated with the excess of the growth rate (g) over the real interest rate (r), i e, $r - g < 0$, it is important to examine the relationship between these two variables. In such a context, it is true that a rise in the real rate would, by weeding out unproductive investment, increase the productivity of capital. We thus initially hypothesise that there should be an inverse relationship between the real rate of interest and the incremental capital-output ratio (ICOR), because the inverse of the latter is a measure of the productivity of capital. To obtain evidence in this regard, we initially obtained smoothed estimates of real interest rates and ICORs and these have been plotted in Figure 17.⁵

The evidence in this regard seems to suggest a negative association between real rates and ICORs which, although weak, cannot be disregarded. For example, the steady fall in r from 0.28 per cent to -4.1 per cent during the period 1959-66 is distinctly associated with an equally steady rise in the ICOR from 2.70 to 3.47 during

this phase; while the subsequent increase in r to 2.49 per cent in 1969-70 is related to a fall in the ICOR to 2.76. This inverse pattern is by and large true right across the sample, especially over the cyclical variations in r during the period 1969-77 and 1977-88, although the relationship seems to break down for the last two years of the sample, i.e., 1994-96, what with increasing values of r being related to rising ICORs. Because there is no theoretical justification for this positive relationship, the pattern seems to suggest that there could be an optimal real rate and values in excess of this could be adversely affecting investment and thereby output, which is then reflected as a statistical increase in the ICOR. We will now examine this possibility more exhaustively.

REAL INTEREST RATES AND GROWTH

Thus, while we have shown that a rise in the real rate would increase the productivity of capital (i.e., decrease the ICOR), it is also true that an increase in the real interest rate could reduce the investment rate per se. As the growth rate is the product of the marginal productivity of capital and the investment rate, the overall effect of the real interest rate on the growth rate would depend on the relative magnitudes of these two conflicting effects; and based upon the earlier results, it seems plausible

that at very high real rates, the negative impact would outweigh the positive impact, thereby causing a contraction in growth.

To ascertain the validity of claim in the Indian context, we correlated five-year period averages of real interest rates on their corresponding five-year period averages of the real growth rate and the resultant plot with the nine scatter points is presented in Figure 18. While most points cluster around low and negative values of r , the rest of them do seem to bear out the contention that high real rates do indeed crowd out growth. To empirically establish this proposition, we estimated the following regression equation (with t -values in parentheses):

$$g = 5.09 + 0.4335r - 0.1968r^2; \quad R^2 = 0.70 \\ (2.9) \quad (-3.4) \quad \dots (15)$$

The corresponding fitted values yields the parabolic curve (denoted by AA') in the figure. We then estimated a similar equation based on annual data over the period 1984-98 and the resulting fitted values yielded the second curve (denoted by BB') and both of them unambiguously indicate that the growth rate could be choked off at high real rates. This could be one of the many reasons as to why the growth rates since 1997-98 have decreased so substantially what with real rates averaging almost 5 per cent over the period 1996-98.

The cyclical trends observed in real interest rates until 1990-91 (Figure 17) leads us to conjecture that, as the nominal rates were administered until then (rendering them more or less fixed), there are cyclical movements in inflation which is not being reflected in the post-liberalisation phase because nominal interest rates were freed thereafter and allowed to reflect market conditions (including expected inflation). In an attempt to obtain evidence regarding the existence of business cycles and in order to ascertain whether inflation is pro- or counter-cyclical in the Indian economy, we generated smoothed estimates of the growth rate (g) and inflation rate (π) over the sample period⁶ and these have been presented in Figure 19.

The results are extremely interesting because the empirical regularity in the ensuing patterns of growth is clearly reminiscent of business cycle behaviour. After 1961-62, the following five business cycles are clearly visible: (i) the seven-year cycle between 1962-69; (ii) the eight-year cycle between 1969-77; (iii) the six-year cycle between 1977-83; (iv) the six-year cycle between 1983-89; and (v) the six-year cycle between 1989-95. While in each of these cases the growth rate has followed the classic pattern of fluctuating around a steadily increasing trend, it is seen that the peaks of the cycles are relatively short-lived (around 1-2 years) as compared to the troughs (almost 2-3 years). It is also interesting to note that, except for the fourth cycle from 1983-89 which is a comparatively weak one, the inflation rate is clearly counter-cyclical with almost identical turning points and with the growth and inflation rates often coinciding at the peak of the cycle. If the six-year pattern is, indeed an empirical regularity, then the recession of 1997-98 is very much part of the sixth cycle which commenced in 1995-96 and, going by the observed trends, the trough should have bottomed out in 1998-99, implying that over the next two years, we should be on the upswing of the cycle which will now peak in 2000-01.

INFLATION, GROWTH AND INCOME DISTRIBUTION

The empirical results in this concluding section are based on a World Bank research project, led by Martin Ravallion and Gaurav Datt, that collated all the available data on income distribution for the Indian economy over the period 1951-92 during which time the government of India undertook 34 surveys relating to the measurement of income inequality under the auspices of the NSSO. Thus,

it is for the first time that such a unique data set (30 annual observations over a 42-year period) on Gini coefficients is available (Appendix VI: Series GI), and this should provide researchers with an opportunity to undertake exhaustive empirical analysis on poverty, income distribution and growth for the Indian economy, in particular; and for developing countries, in general, because India is the only developing country for which such a long and reliable time series measure of income distribution exists.

The purpose of this final exercise was to examine the impact of inflation (π) and growth (g) on the Gini index (GI), based upon the basic premise that while inflation should naturally worsen income distribution, growth should, following the lead of Alesina and Rodrik (1994), amongst others, improve income distribution. As we were interested in explaining the change in the Gini index (ΔGI), we used only the time series estimates over the period 1986-93 as these were the latest estimates available on a continuous basis. The estimated equation [Rao and Nallari 1996] is given below (with t -values in parentheses):

$$\Delta GI = 13.47\pi - 25.61g; \quad R^2 = 0.84 \quad \dots (16) \\ (4.2) \quad (-4.5)$$

The results validate the hypothesis that growth (inflation) reduces (increases) income disparities. Both the estimated coefficients are significant and the equation explains 84 per cent of the variation in the dependent variable, which testifies to the robustness of the relationship considering that we were explaining the change in, and not the level of, the Gini index.

Using equation (16), along with data on actual inflation and growth, we predicted the Gini index from 1993-94 onwards, and the entire series from 1951-52 to 1997-98 is plotted in Figure 20. The original data imply that the dislocation of the economy in 1991-92 caused the Gini index to increase to 32.53 from its previous level of 29.69 in 1990-91; while the predictions indicate that the Gini index returned to its pre-reform level only in 1996-97 and reduced further to about 28.73 in 1997-98. However, the fact that it took almost five years of sustained growth and moderate inflation for income distribution to revert back to its pre-reform level highlights the difficulties involved in reducing income disparities.

Finally, based upon the implications of equation (16), we relate the Gini index to the differential between smoothed growth and inflation, i.e. ($g^* - \pi^*$), the presumption being that they should be inversely related. The results are presented in Figure 20 which not only establishes the contention but also suggests that

variations in income distribution could depend upon the different phases of the business cycle. What is observed in this context is that while a fall in this differential is clearly associated with a rise in the Gini index, a corresponding increase is not as well reflected in a fall in the Gini coefficient. This indicates that the gains made in reducing income disparities during the upswing of a cycle can easily be diluted during the downturn and, considering the previous results which indicate that the troughs of the business cycle last much longer than the peaks, this only strengthens our earlier conclusion that the quest for an equitable income distribution could indeed be a long and arduous one.

III Conclusions

Despite certain problems left unresolved by our earlier exercise on data base consistency (reported in Part I of this paper), we did, to a large extent, succeed in integrating the various macro-economic aggregates which, in turn, has helped us in this concluding part to detect the structural changes that have occurred in the real and financial sectors of the Indian economy over the entire sample period, in general, and between the pre- and post-liberalisation phases, in particular.

In such a context, we identified many important empirical patterns and regularities, notably the existence of business

cycles, the counter-cyclical nature of inflation, the cyclical variations in income distribution, the twin deficits problem, the impact of absorption on reserves, the evolution of the debt-income ratio, the relationship between real interest rates and growth, the sustainability of the fiscal stance, amongst others, which could act as theoretical guideposts for the formulation of issues in the role and conduct of macro-economic stabilisation policy. Because the emphasis in this paper was on the detection of basic empirical regularities and not on the identification of structural breaks and related issues, we used relatively less sophisticated econometric techniques in the process. As such, the results obtained here vis-a-vis the problem of pattern recognition are heuristic and should only be treated as first approximations, although they would hopefully enable researchers to translate the implied inter-relationships into various policy relevant solutions for some of the urgent structural adjustment problems confronting the Indian economy currently.

In this context, one strand of thought was entirely devoted to the so-called "twin deficit" problem and consequently dealt with the determinants, decomposition and evolution of the gross fiscal deficit and the current account deficit. Based upon certain empirical regularities observed here, notably the impact of the fiscal stance on the evolution of the debt-income ratio, we

LISTING OF SUPPLEMENTARY VARIABLES

No	Synbol	Phenomenon	Source

16	INT _{pe}	Interest payments on external debt	(i) Chandhok (1990)
17	Gi	Gini index	(ii) Currency and Finance Datt (1996)

Note As the original estimates of the Gini indices were available on a discontinuous basis from 1951-52 to 1992-93 (i.e., 31 annual observations over a 42 year period), we obtained a complete data set by resorting to the following methodology: (i) We initially extrapolated these indices for the period 1993-94 to 1997-98 using equation (16) and these have been marked with a double asterisk (**) in the data series. (ii) We then interpolated the missing values of these indices by employing a similar variant of this equation which was estimated using the relevant data set in the near-neighbourhood of these missing values. All these interpolations have been marked with a single asterisk (*) in the data series.

did make modest attempts to study the contemporaneous movements in these two deficits by invoking the third gap as well. However, any future efforts to study their inter-relationships more systematically must analyse the factors which caused these deficits in the first place. The CAD as well as the GFD are usually linked within a general equilibrium framework because their basic proximate determinants, mainly the rates of inflation and growth, are themselves endogenous variables. Thus, any meaningful analysis of these deficits would require that their fundamental causes be specifically identified because the general equilibrium nature of the problem is not merely a theoretical linepoint. The literature provides three lines of approach for analysing responses towards such imbalances and the conclusions of most economists who have studied these issues, using an extended three-gap version of the conventional dual-gap analysis (which is a mere formalisation of the rather eclectic approach adopted in this paper), is that the twin deficits are largely the result of the development strategies being followed by the country as well as the macro-economic policies pursued by its major trading partners. Therefore, reducing these deficits would probably, although not necessarily, entail a significant reversal of these policies in order to correct the imbalances.

With many developing countries irrevocably committed to liberalisation, the issues of the optimal sequencing of reforms, in general, and the manner in which the real and financial sectors can be expected to interact with and respond to the domestic and external sectors, in particular, is becoming increasingly important. Only when all these interactions are well understood will it be possible to predict the effects of policy-relevant variables such as interest rates, exchange rates, capital inflows, amongst others, on key macro-economic outcomes such as inflation, international reserves, savings, investment, fiscal deficits, BOP, income distribution and, above all, economic growth. Keeping this in mind, we initially compiled the data (published in *EPW*, August 7) and later on, in this paper, carried out the relevant empirical investigations – based upon this data set – dealing with the recognition of patterns and regularities. In concluding, we do hope that these two papers provoke interest in the measurement and identification of basic macro-economic outcomes because this is probably the only efficient way to obtain theoretical guideposts for the formulation of issues while designing stabilisation and growth-oriented adjustment programmes.

sation and growth-oriented adjustment programmes.

Appendix I

SOME SUPPLEMENTARY MACRO-ECONOMIC STATISTICS FOR THE INDIAN ECONOMY

While we could have identified empirical patterns and regularities based entirely on the data series presented in Table 3*, we felt that their usefulness would be greatly enhanced if they were supplemented by some additional key macro-economic data on the Indian economy. As such, we selected the following 17 variables as being representative of some of the important ones closely related to our earlier set of variables. The listing of these variables (including symbol used and sources employed) is presented in the previous page.

The corresponding data set pertaining to these variables over the 48-year sample period 1950-51 to 1997-98 is provided in Table 1.

(Concluded)

Notes

- 1 It needs to be noted that all figure/equation numbers denoted by an asterisk (*) refer to the corresponding figures/equations in Part I of this paper (published in the previous issue of *EPW*).
- 2 While, following the logic of Table 7*, we could have defined both these variables in terms of $(Y^* + \Delta F)$ doing so would have resulted in a tautological accounting relationship because, from equation (25*), it is obvious that $AR^*/(Y^* + \Delta F)$ is exactly equal to $[1 - (A/(Y^* + \Delta F))]$.
- 3 The Ponzi scheme technically implies that $S = INT_g - \Delta B$. While it is true that the government has resorted to increased market borrowings since liberalisation, which is the prime cause for the subsequent escalation of internal debt, it would be unfair to suggest that this is the only underlying reason for the increase in the INT_g/GDP ratio during 1991-95, because increases of identical and even greater orders of magnitude were witnessed during 1981-85 and 1986-90, respectively, when market borrowings were relatively negligible.
- 4 In this context, it needs to be noted that $RER = E/(Pf/P)$, where E is the nominal exchange rate ($\text{Rs}/\$$), P is the domestic price level which was proxied by the GDP deflator (1991-92 = 1), and Pf is the foreign price level which was proxied by the US GNP deflator (1991-92 = 1).
- 5 The smoothing procedure was carried out as follows. We initially smoothed out the annual time-series data on GDP at factor cost (current prices) and GDP at factor cost (at 1980-81 prices), i.e. the series Y_{fc} and $Y_{fc}(t)$, respectively, in Table 1, by using five-year moving averages. We then divided the smoothed estimates of Y_{fc} by the corresponding smoothed estimates of $Y_{fc}(t)$ to obtain smoothed estimates of the GDP deflator (P). These smoothed estimates of P were used to generate smoothed estimates of the annual inflation rate (π) which, in turn, were used to obtain smoothed estimates of the real interest rate defined as the difference between the one-year deposit rate and the rate of inflation (i.e. $r = (1 - \pi)$) over the sample period. We then smoothed out the annual time-series data on NDP at factor cost (at 1980-81 prices), i.e.

the series $NY_{fc}(t)$ in Table 1, by using five-year moving averages. We then divided the five period difference in net fixed capital stock (at 1980-81 prices), i.e. the series K in Table 1, by the corresponding five-period difference in the smoothed estimates of $NY_{fc}(t)$ to obtain smoothed estimates of the ICORs $1 = (K_t - K_{t-5})/(NY_{fc}(t) - NY_{fc}(t-5))$.

- 6 The smoothed estimates of g were computed on the basis of the smoothed estimates of $Y_{fc}(t)$ obtained earlier, while the smoothed estimates of π were the same as those used in the computation of r .

MUMBAI BRANCH

Schedule 17 – Notes to Accounts for the Period Ended 31st March, 1999

I. PRINCIPAL ACCOUNTING POLICIES

1. General

The accompanying statements have been prepared on historical cost basis and in accordance with the generally accepted accounting principles and practices prevailing in the country.

2. Revenue Recognition

Income and Expenditure are accounted for on accrual basis except in the following cases:

(a) Interest on Non-Performing Assets is recognised on realisation basis as per RBI guidelines laid down by Reserve Bank of India (RBI).

(b) Interest which remains overdue for 2 quarters on securities not covered by Government guarantee is recognized on realisation basis as per RBI guidelines.

3. Transactions Involving Foreign Exchange

i) Transactions during the year in currencies other than Indian Rupees are recorded at the exchange rates prevailing on the date of the transactions.

ii) As of the Balance Sheet date, Monetary assets and liabilities are translated at exchange rates notified by Foreign Exchange Dealers Association of India (FEDAI) and Profits or Losses arising from such transactions are included in the Profit and Loss Account.

iii) Contingent Liabilities in currencies other than Indian Rupees are disclosed as under:

(a) Bill for Collection is held by bank on behalf of customer at contracted rate.

(b) Guarantees are stated at contracted rates.

iv) Profit or loss on Pending forward contracts has been accounted for.

4. Investments

Investments in approved securities are classified into "Permanent" and "Current" categories as per R.B.I guidelines. Permanent Investments include those investments which are intended to be held by the bank till maturity or on long term basis.

Investments are valued as per guidelines laid down by R.B.I as under:

i) Permanent investments are valued at cost.

ii) Current investments have been valued at lower of cost or market value. For the purpose of considering the market value, Stock Exchange quotations wherever available have been taken and where the investments are not quoted on the Stock Exchange, the same have been valued as per the norms laid down by Reserve Bank of India.

5. Fixed Assets & Depreciation

i) Fixed Assets are stated at historical cost.

ii) Fixed assets are depreciated on the Reducing Balance Method at rates which are higher than those prescribed in Schedule XIV of the Companies Act, 1956. The principal rates of depreciation used by the bank are as under:

Electronic Data Processing Equipments,

Movable Furniture & Fixtures and Other Equipments @ 45.10%

Other Furniture & Fixtures @ 20.00%

iii) Depreciation on assets acquired during the period is provided on pro-rata basis from the month of addition.

iv) The expenditure incurred for addition/modification to leased/tenanted premises are capitalised and the depreciation, on the same, is provided as mentioned in (ii) above. In the year of expiry of the lease/tenancy the written down value of the assets not transferred to the new premise will be fully depreciated/written off.

6. Retirement & Other Staff Benefits

Gratuity is Provided on the basis of the Payment of Gratuity Act, 1972. The amount of bonus payable as per Payment of Bonus Act, 1965 is provided for and charged to the Profit & Loss Account.

7. Advances

Provisions for loan losses is made in respect of identified Advances based on the provisioning guidelines issued by R.B.I.

CHB CHOHUNG BANK

(Incorporated in Korea with a limited liability)

MUMBAI BRANCH

MUMBAI BRANCH

Auditors' Report on the Mumbai Branch of ChoHung Bank, Situated at Mumbai Under Section 30 of the Banking Regulation Act 1949

We have audited the attached Balance Sheet of the Mumbai Branch of CHO HUNG BANK as at 31st March, 1999 and also annexed Profit and Loss Account for the year ended on that date.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and the Profit and Loss Account together with the notes attached thereto are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are, therefore, drawn up in conformity with Forms 'A' and 'B' of the Third Schedule to the Banking Regulation Act, 1949.

We report that:

1. We have obtained all information and explanations, which to the best of our knowledge and belief were necessary for the purpose of our audit and found them to be satisfactory.
2. The transactions which have come to our notice have been, in our opinion, generally within the powers of the Mumbai Branch.
3. In our opinion, proper books of accounts as required by law have been kept by the Mumbai Branch, so far as it appears from our examination of those books.
4. The above mentioned Balance Sheet and Profit and Loss Account of Mumbai Branch, dealt with by this report are in agreement with the books of account.
5. In our opinion, and to the best of our information and according to the explanations given to us the Balance Sheet and Profit and Loss Account, together with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Mumbai Branch of the Bank as at 31st March, 1999 and in case of Profit and Loss Account gives a true and fair view of the profit of the Mumbai Branch of the Bank for the year ended on that date.

Shastri Indo-Canadian Institute FELLOWSHIPS FOR CANADA 2000-2001

CANADIAN STUDIES FELLOWSHIPS FOR 2000-2001

The Department of Foreign Affairs and International Trade, Government of Canada, through Shastri Indo-Canadian Institute, invites applications from Indian scholars for Canadian Studies Faculty Research, Faculty Enrichment, and Doctoral Research Fellowships

Eligibility: Applicants in all categories must be citizens or permanent residents of India and proficient in either English or French. Repeat applications for faculty awards will not be considered until the objectives of the earlier award have been demonstrably achieved.

a. Canadian Studies Faculty Research and; b. Faculty Enrichment Fellowships

These awards are intended to fund a visit to Canada of up to five weeks in duration to work on projects identified by the applicants. The projects should lead to the publication of scholarly articles in India in the case of research awards and the development of courses on Canada in Indian universities in the case of enrichment awards. Preference will be given to projects which focus on topics in the social sciences and the humanities and which lend themselves to enhancing the understanding of Canada, or of the Canada-India relationship, in India.

Applicants will normally be full-time members of the academic staff of a recognized institution of higher education or an equivalent degree-granting organization in India. Faculty Research applicants may also be scholars at research and policy institutes in India or professors emeriti. Applicants should hold a degree equivalent to postgraduate qualification. Applications will be considered from those without these formal qualifications only if successful research and teaching experience can be demonstrated. Applicants able to provide evidence of their interest in or involvement with Canada prior to the application will be preferred. This may be demonstrated by courses already given, research undertaken, active membership in relevant organizations, etc.

Please note that all successful applicants in both faculty categories will be required to attend a Canadian Studies summer-institute-orientation session for four days in May or June 2000 at a location in Canada to be announced and a one day orientation workshop in New Delhi. The remainder of the award period will be spent working on the projects proposed in the applications.

c. Canadian Studies Doctoral Research Fellowships (Canadian Studies Graduate Awards)

These awards are intended to fund research in Canada for a period of up to ten months on the applicant's doctoral dissertation. Preference will be given to applicants whose dissertations focus on topics in the social sciences and the humanities, which are most likely to advance understanding of Canada in India. Applicants must be enrolled as doctoral candidates in a recognized institution of high education or equivalent degree-granting organization and must expect to have completed non-thesis requirements of the Ph.D. by the time the tenure of the award commences.

Shastri Indo-Canadian Institute, with funding from the Canadian International Development Agency (CIDA), invites applications from established Indian Scholars in the areas of Development and Environment, Social and Economic Reform, Private-sector Development, Gender and Development; for the following fellowships:

- a. **Development Studies in Social Sciences and Humanities:** This fellowship enables the Indian Scholar to undertake research and related activities on various development issues. Duration: four months between 1 September 2000 and 1 January 2001.
- h. **Women and Development**
 - i) **Faculty Research Fellowships:** These fellowships enable the faculty members of Indian Colleges and Universities to carry out research in Canada. Duration: four months between 1 September 2000 and 1 January 2001.
 - ii) **Doctoral Research Fellowships:** These fellowships are intended to support research in Canada on the applicant's doctoral dissertation. Applicants must be enrolled as doctoral candidates in a recognized institution of high education or equivalent degree-granting organization and must expect to have completed non-thesis requirements of the Ph.D. by the time the tenure of the award commences. Duration: up to eight months between 1 September 2000 and 1 January 2001.
 - iii) **Pilot Project Awards:** These awards make possible the preliminary exploration of a research proposal that gives promise of substantial further development. Duration: up to two months between 1 September 2000 and 1 January 2001.
 - iv) **Visiting Lectureships:** These fellowships enable Indian scholars to visit Canada for a period of three weeks to give lectures and to do some networking with colleagues in their academic area. Duration: three-week lecture tour in Canada between 1 September 2000 and 1 January 2001.
- e. **Media Fellowships:** These fellowships support the research of mid-level journalists in print and electronic media in Canada for a period of four months each to explore in depth a developmental issue. Duration: four months between 1 September 2000 and 1 March 2001.

Since these awards are a part of the Institute's Development Studies Programme, work to be carried out during the tenure of the fellowships must have a clear developmental significance.

General Eligibility: Candidates must be: i) citizens or permanent residents of India, ii) have a clear and focused plan of work which can reasonably be implemented during the tenure of the fellowship; and iii) be prepared to leave for Canada no later than 1 January 2001 if selected.

Value: i) excursion rate return air ticket between India and Canada; ii) Cdn \$ 500 for books and personal effects; iii) a living and accommodation allowance.

ENQUIRIES AND APPLICATION FORMS

For the application materials please write to the following address (specifying the category of fellowship) by sending a self-addressed RS-25 stamped envelope(s) (size 26 cms x 30 cms) superscribing the name of fellowship to: Shastri Indo-Canadian Institute, 5, Bhai Vir Singh Marg, New Delhi 110 001.

A separate stamped envelope is required for each fellowship Category.

DEADLINE: For REQUEST of application forms: September 10, 1999 by post and September 17, 1999 in person and for RECEIPT of completed applications: October 1, 1999. (5.00. p.m.)

CENTRE DE SCIENCES HUMAINES

L S H The Centre de Sciences Humaines (New Delhi), along with the French Institute of Pondicherry, is one of the twenty five research centres of the French Ministry of Foreign Affairs, which conducts research work in social sciences and humanities in various countries. The Centre's main objectives include:

- conducting joint research programmes, which highlight the contemporary dynamics in South Asia,
- acting as an interface between French and Indian research institutions, scholars and students,
- providing access to logistical support and a well-stocked library to European and Indian researchers.

The CSH focuses on four main research themes:

- Economic growth and sustainable development
- International and regional relations
- Institutional structures and political constructions of identity
- Urban dynamics

The CSH also organizes seminars and conferences at New Delhi, in collaboration with Indian institutions.

Vol XXXIV Nos 34 and 35

August 21-28, 1999

Electoral Politics in India, 1989-99

The changing outcome of the electoral game in this decade may be seen as the reflection of a fundamental transformation in the terrain of politics which in turn is anchored in the process of social change. While the structure of choice inherent in elections has undergone change, the exercise of that choice is not necessarily the act of sovereignty that it is meant to be in a democracy. **2393** By a combination of subtle redefinition and judicious alliances, the BJP has been able to change the composition of its social base and venture out from its nesting ground in the north. **2511** The diverse social profile that the Congress had cultivated in the past through active political mobilisation is non-existent today and it has been reduced in most states to picking up votes that other parties have not been able to mobilise. **2518** With de-ritualisation, caste now operates in a different newly-emergent system of social stratification where members of different castes form themselves into larger horizontal social groups and are competing for entry into the middle class, changing thus its pre-independence character and composition. **2502** Notwithstanding the BJP's recent spread into all regions of Uttar Pradesh, there are structural limitations – in the form of rigid caste polarisations and the strong social bases of the SP and the BSP – to its emergence as a dominant broad-based party in the image of the Congress of the past. **2400** In Bihar, while there are clear indications, in the changing social composition of political representation, of the important role that the middle castes are playing, the emergence of broad-based social configurations rather than 'backwardism' may be the future characteristic of politics in the state. **2472** The articulation of the aspirations of different social groups, especially of those in the subaltern ranks, has contributed to the volatility of their electoral support in Andhra Pradesh. In the process parties which have encouraged articulation of particular caste aspirations may well turn out to be the losers. **2449** The pre-eminence of the Congress in Maharashtra is based on two disjunctions: while it claimed to represent the oppressed, it was a maratha-kunbi dominated party; similarly, while it drew support from rural voters, it served urban interests. The BJP-Shiv Sena alliance shows no such disjunction between material and political domination. **2409** In Gujarat the traditional social support bases of the Congress have been either won over or neutralised by the BJP. **2423** The Congress has attempted to widen its support base in recent years among the OBCs and is projecting itself as the 'natural' choice of the poorer classes in Karnataka. **2440** The movement away from traditional centripetalist politics and the movement for a separate state of Uttarakhand makes the region a distinct political entity which yields interesting insights into electoral processes. **2459** The mechanisms of accountability, democracy's chief virtue, do not seem to deter the current crop of political leaders of all parties in Goa and the politics of pragmatism makes party ideologies irrelevant. **2434** In Himachal Pradesh, physiographic and demographic factors have come to exercise much influence on electoral politics. However, the struggle for power on caste lines is not as visible or intense here as elsewhere. **2465** In its transition to modern representative democracy, the electoral agenda in Meghalaya is still largely determined by clan and kinship loyalties in tribal communities and both the BJP and the Congress have had to take cognisance of this. **2481** In Assam a number of smaller ethnic communities are beginning to carve out areas of influence through their respective parties, which accounts for the fact that national parties have not been able to pose an effective challenge to these regional forces. **2492**

Role of Rajya Sabha

THE arguments for and against the holding a special session of the Rajya Sabha to discuss the Kargil conflict were covertly political. The author of 'Rajya Sabha: Redefining its Role' (July 24) has wisely separated them from the larger question and dealt with the issues concerning the interregnum between two Lok Sabhas when the Rajya Sabha is the only wing of the union parliament, which is in existence. The point made is that it is the only representative wing available for consultation by the caretaker government. Even for the president, it is a forum he could turn to for some sort of an advice on the prevailing view on important matters of government policy. A conundrum for constitutional experts has also been posed: Lok Sabha, is the power giver to the council of ministers, the council loses Lok Sabha's confidence, Lok Sabha loses its existence; in the circumstances is the council competent to advise the president?

To understand the conundrum, one needs to address some basic issues including the role of the president between elections. Meanwhile, it would be wise to look closely at the Rajya Sabha and recall its position in a bicameral parliament. The 'rajya' in its name refers to the states of the union. The English title is council of states. Of the two houses of parliament it is the upper one because it is expected to function as a house of elders. The intention of creating the Rajya Sabha was to provide a sounding board to test legislative policies, as well as a forum of advice and guidance, which would include voices from the states and the perceptions of persons of eminence from the arts and sciences, mass media, sports, etc. The latter would be brought in by nomination, as they would in the ordinary course not enter any electoral fray. Political groupings, protestations based on party loyalties, unruly conduct and such do not fit into this picture.

The pristine concept of the Rajya Sabha found in the Constitution has been mutilated out of recognition by the venality of political parties. The house of elders is no longer a body of sober debate and mature guidance. The utter cynicism with which political parties have collared seats in the Rajya Sabha mocks the Constitution. It is fractured on political lines and all members behave like they form a diluted version of Lok Sabha. We have the spectacle of otherwise enlightened and responsible individuals hypocritically seeking to speak for far-off places other than their nativity,

and of lawyers nominated for their eminence as jurists unhesitatingly acting as the mouthpiece of a political party. As a political scientist has put it: Presently the Rajya Sabha represents none and discharges no special functions except to act as an appendix or a second chamber of a unitary system of government. No, the Rajya Sabha is not what it should be. The Rajya Sabha of the Constitution needs to be restored to its original status and functioning. This is all the greater need when, as now, an increasing dose of federalism is flowing into the Indian polity. Meanwhile, the voice of the people and the counsel of the wise are not to be equated. They occupy different political spaces. As a representative house the Rajya Sabha is not a substitute, and cannot be a surrogate, for the Lok Sabha except for those who have mangled the intention of the Constitution.

State Terror

HAVE you ever been into Southall train station? If you have, do you remember seeing a pleasant-looking Sikh guy wearing a blue turban? Balbir Singh has been working for Thames Train services for at least a decade. But now, since June 24, on a trip to India, he has been detained by Indian police at Delhi airport for allegedly 'bringing in RDX to blow up parliament'. He was on his way to a wedding at the time, but instead of celebrating has been imprisoned and subject to torture. He was on his way to being transferred to the notorious Punjab police when media and

international pressure curtailed the move, and now he's awaiting trial. His wife only suspected something wrong when he did not phone on arrival. His relatives managed to get his whereabouts a few days later. He has five children – aged between 7 and 14, the eldest being physically disabled, and very much dependent upon his income for livelihood. From what I know about Indian prisons, they are infested with rats, cockroaches, mosquitoes amongst other dangers. Anyone who has come out of them has suffered from, at best, malaria, at worst, AIDS. Every day he stays in there he is courting death. And knowing the Indian litigation system, that could be months if not years. Why am I doing this? Because I used to see the man at Southall train station from 1991, and I remember him as a smiling, polite and hard-working guy. The last time I saw him was two months ago on his way to the office. The man apprehended could have been my dad – an innocent abroad who happened to be wearing a turban. Also what happened to the wedding gifts? I'd hate to think.

I want to spread this news to as many people as possible so that it would have knock-on effect. If you are as shocked and upset as I am please do likewise. Silence is itself a kind of conspiracy. If you want to do something more about it, write to your local MPs, the Indian Embassy, journalists, any suitable organisations in UK or in India, Indian ministers and politicians (if they can spare a moment from election fever), etc. For more information, contact 0181 840 3222 or e-mail: psing@brookes.ac.uk me.

Polarisation and Consensus

DO poll manifestos matter? Political parties forget them the day after polling; the vast majority of voters never get a chance to see them and, in any case, are influenced in their voting behaviour by more proximate concerns such as the caste of the candidates and how they promise to solve local problems. Manifestos are still worth our attention because they offer several things important in a democracy: one, a standard of performance against which subsequent achievements can be measured; two, a measure of the issuing party's clarity on policy; three, articulation of the popular consensus on major themes – parties that entertain reasonable hope of getting elected to power say what they believe the voters would like them to say rather than what they actually stand for.

There is a great deal of similarity between the manifestos of the Congress and the BJP-led National Democratic Alliance. Both present secular, inclusive visions, want economic reform in the present direction and at the current pace, seek sound federal relations, call for stronger defence, promise to strengthen decentralised, pro-poor development. This is worthy of note on its own. The polity has become relatively more polarised than in the past between the BJP-led front and the Congress camp but the area of consensus between the two sides has expanded. This is a direct result of the BJP's realisation that it cannot become the ruling party of the country by continuing with its sectarian Hindutva agenda. To broaden its direct appeal and indirect reach through allies who would have none of Hindutva, the BJP has been trying to substitute good governance as its defining characteristic in place of identity politics.

The BJP has refrained from having a manifesto of its own. The common manifesto of the BJP-led NDA has called for a moratorium on contentious issues. BJP leaders have clarified that the contentious issues are the demand for building a Ram temple at the site of the demolished mosque at Ayodhya, scrapping Article 370 of the Constitution which gives Jammu and Kashmir certain degrees of freedom not enjoyed by other states and instituting a uniform civil code in place of the communitywise personal laws currently followed. That a moratorium is not quite the same thing as giving up became clear in the subsequent controversy over the BJP's commitment to these demands. Their unapologetic espousal by party general secretary Govindacharya, outright rejection by prime minister Vajpayee and indefinite deferment by spokesperson Venkaiah Naidu reveal that the BJP's evolution into yet another centrist party is far from complete and remains a

source of severe intra-party strain. The NDA manifesto's obsession with Vajpayee's visuals and Vajpayee's putative achievements also reflects the BJP's desire to put its liberal face forward.

The NDA and the Congress both seek electoral reform to eliminate criminals and reduce money power. The NDA manifesto does make a crucial demand that the Congress does not: review of the Constitution. Its operational significance in the 13th Lok Sabha might be insignificant, but it is significant for the window it offers the BJP to push forward its own agenda, whether under moratorium or not.

The Congress and the NDA both want the economy to grow by 7-8 per cent a year. Both will try to legislate fiscal responsibility. Both manifestos stand for better federal relations. However, both manifestos also do violence to the constitutional division of responsibilities between the centre and the states by burdening their prospective governments with extensive activism in areas of state-level responsibility. That this makes a mockery of their professed commitment to fiscal discipline escapes the attention of both manifestos.

Both the Congress and the NDA aim at foreign investment of around \$10 billion a year, including in the insurance sector. Both want to create a non-segmented market in India and therefore a switchover to value added taxation. Neither talks about privatisation of the public sector, although restructuring of the public sector and disinvestment are favoured. The Congress is more forthright on trade reform, seeking tariffs of Asian levels very soon. The NDA has abandoned the traditional stance of WTO-bashing and merely seeks to assert India's rights in the forum. This means that trade liberalisation will proceed at the pace required by India's membership of and commitment to the world trade body, whoever forms the government. The overlap between the economic agendas of the two sides will help the new government pass laws: they have to co-operate in the Rajya Sabha where neither side will have a majority, whoever commands a majority in the Lok Sabha after the elections.

Both the NDA and the Congress manifestos reflect their concern for industrial restructuring. However, neither finds the courage to say that laws that prevent such restructuring and permit redeployment of resources from inefficient managements to efficient ones will ruthlessly be changed. This shows that for India's major political parties reform remains something that has to be introduced by stealth. If either political camp sees overhaul of the country's economic laws, including those relating to industrial relations and

corporate control, as a necessary part of reform required to generate fast growth that will abolish poverty and unemployment, they choose to keep quiet in their manifestos about any such radical convictions.

Both carry forward the statist tradition of India's political parties. While mobilisation of the people for essential regeneration of society, in terms of education, hygiene, health, intercommunity amity and participation in local government does not call for the instrumentality of the state, the Congress and the NDA, as well as the Left parties, portray this as a state function. The vision of politics revealed by the manifestos is that of a process identified with the exercise of state power. To conceptualise a political party as an agency that awakens, organises and articulates the democratic urges of the population is beyond these manifestos.

The parties' commitment to fiscal reform is suspect, for a variety of reasons. Both the NDA and the Congress believe in extensive and intensive state activism to tackle each and every social ill. Such activism takes the empirical form of schemes, programmes, buildings, staff and materiel. The NDA, in fact, calls for "all kinds of subsidies" for the rural population. This spells expenditure. The BJP's record on fiscal restraint gives no credence to its promise of future discipline. The sudden surge in the states' fiscal deficit from less than 3 per cent of GDP to more than 5 per cent of GDP in 1998-99 surely reflects the BJP government's dependence on regional parties that run state governments with a huge appetite for debt. After all, no state government that owes the centre money can raise a single rupee of fresh debt without the centre's permission. Such vulnerabilities will haunt an NDA government as well. Further, the BJP-led government's refusal to raise retail prices of petroleum products although oil prices more than doubled during its brief tenure shows little sign of fiscal responsibility. Such off-budget items as the oil pool deficit and the public sector undertakings' borrowings matter, along with the combined fiscal deficit of the states and the centre, when it comes to macro-economic management. The measure of this total claim on funds by the government sector is the gross public sector borrowing requirement. The reforming zeal of the Congress had failed to lower the PSBR from around 10 per cent of GDP during its 1991-96 stint.

In sum, given their political timidity over breaking with traditional notions of the state's role in the economy and given their record in office, the manifestos of the two major contenders for power offer the prospect of muddling reform at a muddling pace after the elections.

NUCLEAR DOCTRINE

Mainstreaming the Debate

THE announcement of an Indian nuclear policy by the National Security Advisory Board (NSAB) came as no surprise. After all this is simply a documentation of the government's nuclear agenda which opened with the Pokhran tests, an agenda which has not been given the stamp of approval yet, not having been subject to parliamentary debate. What is curious is, of course, its timing. Announced and released at a time when the country is in the throes of elections after which, regardless of who returns to power, the government will have a changed composition, the nuclear policy document ensures that no political party can afford to avoid setting out a clear policy statement on the nuclear issue. In fact that is its stated purpose: "to encourage public debate on the topic".

Insofar as it has put down on paper views on nuclear weaponisation which one presumes are those of the BJP-led government, it is in the nature of a gambit which if pursued will effectively prepare the ground for the long-overdue public debate on nuclear issues. Taken further, it may well be the first major step towards articulation of well-founded mass opinion not only on the nuclear issue but issues relating to weapons of mass destruction in general. It is not that there has been no public debate, but these have generally remained on the fringes, on the platforms of alternative streams of opinion. In the past while political parties have had a 'consensus' on nuclear weapons, that consensus has not been arrived at through public debate. In consequence, the nuclear issue came into the public arena for some specific reasons, such as the signing of the Nuclear Proliferation Treaty, and the debate has necessarily been a fractured one. At another level, there has been a curious disjuncture: political parties have by and large quite impressively and wholeheartedly supported the 'peaceful' development of nuclear power, etc. again without debate, even while protesting loudly on the nuclear issue. With the Pokhran tests, the disjuncture has been even more sharp, with nuclear power issues almost acquiring a sacrosanct status, a status seen to be violated by India's entry into the nuclear weapons arena through the nuclear tests.

A first criticism of what has been titled the Indian Nuclear Doctrine would be that it is silent on aspects other than weaponisation. Nowhere, not even in the preamble, is there a suggestion (one would not expect anything more in a brief document) that there are other critical issues

to be dealt with. It is hardly necessary to point to the links between a 'peaceful' nuclear programme and weapons. And in India, the rationale for the huge investment in nuclear power and its development has never been debated at any level. This is another area of 'consensus' without debate. That there is so little comprehension of the impact of nuclear damage, by whatever source, is evident in what the document has to say on 'safety' and 'disaster control'. The ensuring of 'tamper proof procedures and systems' to prevent unauthorised use of nukes is just one aspect of safety; the other more important aspect is to ensure that those who deal with them, those who manufacture them – at all stages – are safe and those who may be exposed to accidental releases may be rendered the best possible care. Moreover, safety is not a limited concept – for after all to make the environment safe for people the government must attempt to put them at least risk from severe damage and death. The very production and build up of nuclear weapons makes this impossible. Brajesh Mishra's remark on the responsibility and restraint of our political leadership as demonstrated in Kargil – "as you would expect from the largest democracy in the world" – hardly inspires confidence. And as for disaster control, in India this has not been possible for even the seasonal natural disasters, often predictable, which take so many hundreds of lives, nor for mishaps in areas potentially at risk as for instance around chemical plants. To imagine that under the nuclear umbrella an appropriate system would be developed for an emergency the likelihood of which is officially regarded as remote is absurd.

It would be easy enough to dismiss the document as yet another of the BJP-led government's ploys in the political game of one-upmanship. It would be more worthwhile, however, to take the document seriously and use it as a platform for launching a massive campaign, not necessarily against a particular party's preoccupations, but on the much more serious issue of nuclearisation in all its dimensions.

MAHARASHTRA

Changed Equations

WHILE the country is all set to witness bipolar Lok Sabha election contests in many states between the Congress and its allies on the one hand and the BJP and its allies on the other, in Maharashtra Sharad Pawar's three-month old Nationalist Congress Party (NCP) has introduced an element of unpredictability. The complexity of the electoral scene in the state

is compounded by the simultaneous Lok Sabha and state assembly polls which, besides stretching the contesting parties' search for suitable candidates, have raised tantalising questions about the eventual contours of the political equation among Shiv Sena, BJP, the NCP and Congress in the event of a fractured mandate in the assembly elections. A clear majority nationwide for either the BJP-led or Congress-led groups in the Lok Sabha is bound to considerably reduce the NCP's bargaining capacity since, like Mulayam Singh Yadav's Samajwadi Party in Uttar Pradesh, the NCP has not been able to rope in any significant ally. The NCP's chances in the assembly elections appear better as more MLAs (including independents) than MPs in the state have switched from the Congress to the NCP.

If the political re-alignment in favour of the BJP gained momentum in the post-Kargil phase, especially in Bihar, Andhra Pradesh and Karnataka, thus somewhat reducing the possibility of a fractured mandate at the national level, Pawar's NCP in Maharashtra has not succeeded in forging a broad alliance of non-Congress, non SS-BJP parties. CPI and PWP opted out of an alliance with NCP due to differences over seat distribution. But more importantly, the RPI in the state, like the Congress, has split vertically, with the Gavai-Kavade-Ambedkar faction aligning with the Congress and the Athavale faction entering into a tie-up with the NCP. The combined impact of this split in the Congress and in the neo-Buddhist vote is expected to be significant in Vidarbha region, where the neo-Buddhists, besides malis, telis and kunbis, traditional Congress supporters, have a sizeable presence in many constituencies. For example, Congress candidate Vilas Muttemwar, who secured a handsome victory in the 1998 Lok Sabha election in Nagpur, by garnering 4.86 lakh votes, of which an estimated 1.4 lakh votes were of dalits, is expected to face a serious depletion of dalit votes as the NCP has put up a dalit candidate, Ashok Ghodghate, belonging to the influential Khobragade group aligned to the Ramdas Athavale faction. The dalit factions have decided not to put up a rival dalit candidate, and so dalit votes in Muttemwar's constituency are likely to swing in favour of Ghodghate. Though the SS-BJP had lost all the 11 Lok Sabha seats in Vidarbha to the Congress in 1998, quite a few SS-BJP candidates in the region had registered increases of 25,000-30,000 votes. In the coming three-cornered contests, the SS-BJP alliance is expected to neutralise the margin of their defeats in 1998 in the Nagpur, Bhandara, Buldhana, Amravati,

Akola and Chikur Lok Sabha constituencies, the last three of which had then sent dalit leaders R S Gavai, Prakash Ambedkar and Jogendra Kavade to the Lok Sabha. Without Pawar and Bhujbal, the Congress in Vidarbha clearly lacks a state-level leader to sustain its campaign.

Though Madhavrao Scindia, to counter Pawar, did play up his Maratha identity in his election tour of south Maharashtra, except for Sushil Kumar Shinde from Solapur and Prithviraj Chavan from Karad, none of the other Congress Lok Sabha candidates can be confident of their success in Pawar's bastion. In adjacent Marathwada, which is home ground for BJP's Gopinath Munde, the BJP expects to recover lost ground after expanding its base among dhangars, vanjaris, banjaras and inangs and by taking advantage of the split in the Congress. Though some Congress candidates for Lok Sabha and the state assembly such as Shivraj Patil, Vilasrao Deshmukh, Ashok Chavan and NCP candidates such as Madhav Kinhalakar and Padamsinh Patil are expected to be re-elected, the sizeable Muslim vote in the region is going to be crucial in deciding the fate of a large number of the candidates.

It is in Konkan and in the Mumbai region that the SS-BJP alliance is expected to gain the most from the Congress split. Konkan has been the Sena's stronghold. The division in the Congress vote has compelled Congress leader A R Antulay to abandon Raigad for Aurangabad and persuaded the PWP's seasoned leader D B Patil to contest the Lok Sabha election on a Sena ticket from Raigad. Similarly, Ramdas Athavale has opted for Pandharpur, vacating his Mumbai north-central seat for Sena's Manohar Joshi. The split in the Muslim and dalit votes poses a challenge even to otherwise strong Congress candidates such as Murli Deora and Gurudas Kamat as they try to retain their Mumbai south and Mumbai north-east seats, respectively.

Against this picture of the votes in Maharashtra being divided among the three main contestants, one thing seems reasonably certain: in the new state assembly there will be few independent MLAs compared to the 45 in the dissolved one.

POLITICAL DECENTRALISATION

Evading Clear Commitment

A correspondent writes:

ON centre-state relations, both the BJP-led alliance and the Congress have chosen to be equally vague and non-committal in their respective manifestos. All that the Congress manifesto says on the subject is

that it "believes in a strong centre, strong states and strong panchayats and nagar-palikas". As far as the manifesto of the BJP-led alliance is concerned, it speaks of centre-state relations in the context of the proposed constitutional and legal reforms, noting that "there is a clear case for devolution of more financial and administrative powers and functions to the states". When it comes to committing itself to concrete measures in this regard, all that the manifesto promises is to "take suitable steps to ensure harmonious centre-state relations in the light of the recommendations of the Sarkaria Commission and also effect decentralisation right up to the grass roots level by activating and involving panchayats and local bodies". In fact in the whole manifesto of the alliance this is the only context in which a reference is made to panchayats and local bodies. The Congress manifesto devotes quite some space to these bodies, but all that it really promises is that money under anti-poverty and rural development schemes will be remitted directly to the grass roots bodies, without any commitment regarding additional powers, functions and funds.

The Left has promised "constitutional amendments for devolving more powers in the economic, fiscal and administrative areas; decentralisation of powers to the local bodies including local participation in the formulation of plans and projects". The Congress manifesto totally glosses over the question of devolution of financial and administrative powers and functions to the states, not even in the context of the implementation of panchayati raj, even though it pays lip-service to the need for "meaningful forward movement" as envisaged in the Constitution, with a view to "realising the aims and objectives of the constitutional amendments brought by Shri Rajiv Gandhi". The Congress closes its eyes to the progress already made in a state like Kerala with regard to effective devolution of financial and administrative powers and functions to panchayats and nagarpalikas to enable them to fulfil their role as not only units of local self-government, but also as agencies for local planning and development. In Kerala, the CPI(M)-led coalition has not only implemented the recommendations of the state finance commission on non-plan financial devolution but gone further and decided to allocate over 35 per cent of the state plan to the local bodies for financing plans formulated at the local level with the full involvement of the gram sabhas under its People's Planning Programme, locally referred to as Janakeeya Aasuthranam, which is under implementation since August 1996.

CURRENT STATISTICS

EPW Research Foundation

Many economic indicators are looking up. recovery in manufacturing output with notable increases in consumer durables, capital goods and intermediate goods, reversal of the decline in exports, reduction of the trade deficit and continued foreign exchange accrual; turnaround in use of bank finance by the commercial sector, sudden and sharp recovery of share prices; and persistent decline in the inflation rate measured both by the WPI and the consumer price indices. Even RBI credit to the centre has remained moderate this year so far, despite the government's large market borrowing.

INFORMATION THAT COULD MAKE ALL THE DIFFERENCE...

ICRA Offers...

Investment Information Publications & Corporate Reports

Avail of the introductory limited-time discount on the publications of ICRA Information Services - a division of ICRA Limited - and keep yourself updated of the latest trends in Indian markets and industries.

Now, ICRA's unique **Full Pack Subscription Scheme** entitles you to subscribe to all the publications listed below for a mere Rs.75,000 (US\$ 3,000 for overseas subscribers) annually.

ICRA Corporate Review (two issues a year) The ICRA Corporate Review (ICR) provides select information and insightful commentary on a universe of Indian corporates. It is designed with the specific objective of providing timely access to independent, unbiased and dependable opinions on Indian companies.

Corporate Perspectives (on 50 companies) The reports provide exhaustive and reliable information on corporate entities besides analysis by our Research Analysts. The reports are designed to facilitate the investment/credit decisions of investors/lenders.

Reports in The Industry Watch Series (on six Indian industries) Reports in the Industry Watch Series present in-depth analyses on different industries, providing an insight into industry competitiveness, the imperatives for succeeding in a global scenario, and the relative positions of industry participants. The reports present extensive information and incisive analyses across a spectrum of industries.

Money & Finance Bulletin (four issues a year) The Money & Finance Bulletin is a quarterly publication directed towards individuals with an interest in understanding the reasons underlying policy initiatives and outcomes.

Rating Profile (six issues a year) A unique bi-monthly source of reference from ICRA Information Services, the Rating Profile contains the rationales for the ratings assigned, and the rating symbols and implications.

Rating Update (six issues a year) A bi-monthly rating informant, the Rating Update serves as a single-point reference on all ICRA ratings outstanding.

Press Releases (as and when issued). All press releases issued by ICRA, including releases pertaining to ratings assigned or revised. Press releases covering industry reports or outlook, and new services/products will also be despatched as and when they are issued.

For details of the Full Pack Subscription Scheme, please contact.

RAYMOND

Streamlining for Performance

RAYMOND, the flagship company of the Singhanian group, is a market leader in the worsted textiles industry with a market share of 40 per cent. However, the company's diversification into unrelated cyclical areas like steel and cement has adversely affected its performance over a period. Though this diversified company performed well during the year 1998-99, following savings in operational costs, better cement prices and low raw material prices for textiles, all is not well within. The company's steel division faced stiff competition in the face of increased capacities coming on stream in the industry, leading to lower price realisations. The demand for textiles too was sluggish and there was a flooding of supplies at very low prices by manufacturers in India and the south-east Asian countries. However, the company's wide range of fabrics and its aggressive promotion campaign, and its strong distribution chain, helped it maintain a leadership position in the industry. With cement prices in the eastern region, especially in West Bengal, picking up following a boost to the housing sector, the company's cement division witnessed a 4 per cent rise in sales and better realisation.

In a bid to eliminate the fluctuation in its profits because of its diversified nature, the company had decided to concentrate on textiles way back in 1997. However, its negotiations to hive off its steel unit to the Thyssen AG of Germany fell through. The steel division has been a major drag on the company's profitability in the past. Its Rs 500-crore cold rolled steel strips project in Nashik (Maharashtra) has been incurring losses. However, if reports are to be believed, Raymond is once again negotiating with German steel major EBG Gesellschaft of the Thyssen-Krupp Steel group to sell this unit. Raymond's attempts to sell its cement plant too suffered a set-back recently with no bids being received for the tender offer which expired on May 7. This was despite the fact that French cement giant Lafarge and Associated Cement Companies (ACC) had evinced interest in

buying the unit. Raymond had already attempted to sell the cement unit to British buildings and materials major Blue Circle some time ago, but the deal fell through.

Raymond has now embarked on a fresh restructuring plan and appointed Price Waterhouse Coopers to look into the matter. Reportedly, the company plans to concentrate on information technology upgradation and also identify core areas of business thrust in the future. With the cement sector showing signs of revival, sources claim that the company might change its mind about selling off its cement division. The company has also decided to further strengthen its distribution network (which presently boasts of 230 stand alone Raymond shops) by increasing the total number of outlets to 300 in the next 12-18 months. In order to change its carefully created image of an upmarket textile company, Raymond has now launched the Prax range of cotton casuals projected at the younger generation of buyers.

If its restructuring plans go through smoothly, the company could be set for better times in the years ahead. Presently, the company's stock rules at around Rs 73 on the bourses, discounting its 1998-99 earnings by 6.8 times.

ZUARI INDUSTRIES

Concrete Plans

Zuari Industries, a K K Birla group company, is engaged in the manufacture of fertiliser, cement and furniture. The year 1998-99 was not a good one for the company. While its net sales declined by 10.4 per cent over the previous year, 1997-98, operating profit fell drastically by 39.4 per cent. A steep increase in interest charges (up 16.5 per cent) led to a further erosion in profitability with the company's bottom line plummeting by 70.3 per cent by the end of the year under review. Production of ammonia, urea, NPK and DAP at the company's fertiliser division was lower than in the previous year following a planned revamp of all plants, an illegal strike by the haggling contract labour and a breakdown caused by fire in the main electrical system. Production of clinker and cement at its cement division too fell drastically

following the ongoing integration of various process facilities of the existing plant with the plant and machinery installed under the expansion project and commissioning and stabilisation of the expanded plant. Cement prices too were under pressure due to recessionary conditions.

Though the company's furniture business has been looking up, this presently contributes less than 2 per cent of the company's turnover. Meanwhile, the company has successfully raised its cement manufacturing capacity from 5 lakh to 17 lakh tonnes at a total cost of Rs 357 crore. The cement division has now entered the blended cement market with its brand Zuari Super Fine and earmarked up to 20 per cent of its total capacity for the same. The company also has plans to set up a two-million-tonne per annum cement factory in Gulbarga, Karnataka, at a total cost of around Rs 800 crore. Cement presently contributes about 13 per cent of Zuari Industries' turnover and once its expansion plans take concrete shape, so to speak, this contribution could more than double, thus inextricably linking the company's fortunes with that of the cement industry as well. The company's stock presently quotes at around Rs 57 on the Bombay Stock Exchange, discounting its 1998-99 earnings by 10.5 times.

GREAVES

New Ventures

Greaves, the engineering arm of the Thapar group, has pioneered the gearbox technology in India for over 40 years and is the largest manufacturer of the product in the country today. The company has a market share of over 50 per cent in worm gearboxes and commands more than 20 per cent of the helical gearbox market. However, the low industrial growth registered in the country has affected the company's performance drastically for the year 1998-99. The company saw its net sales decline by 3.1 per cent over the previous year, 1997-98, while its bottom line fell by 5.7 per cent.

With restructuring being the mantra of corporate bodies who wish to remain competitive in a constantly changing en-

NA: means not available

vironment, Greaves too has decided to shed off its non-core business and concentrate on its strengths. In line with this strategy it now plans to divest its power transmission units by selling or transferring them to BTR European Holdings of Netherlands or its associated company. Reportedly, BTR Holdings will promote a new 100 per cent Indian subsidiary company to which the sale or transfer will be executed. Greaves has already divested its Garuda three-wheeler auto plant at Baramati in favour of a joint venture company Piaggio Greaves Vehicles, which was formed in collaboration with Piaggio Veicoli Europei Spa of Italy. Greaves holds a 49 per cent stake in the venture while the Italian partner holds a controlling 51 per cent.

The semiconductor unit of Greaves too has been divested in favour of Teamasia Greaves Semiconductors, which is a joint venture company with Teamasia. The ailing group company Rajasthan Polymers and Resins (RPRL) has been merged with Greaves with effect from April 1, 1997, and the latter has offset the losses of RPRL against its income for the year. Greaves is now planning to launch a series of new products and embark on new business ventures. It has decided to focus on three key areas: a new range of tractors, a new class of single-cylinder diesel engines and the launch of a new plastic-based wood substitute. The company has a tie-up with SAME SpA of Italy to manufacture tractors and presently has a total installed capacity to produce 10,000 tractors and 15,000 engines per annum. Greaves has already launched its 50 hp tractors and will now be including 25-40 hp tractors as well in its product range. In the next three years, the company means to offer tractors in the range of 25-70 hp. Greaves is aiming to spend Rs 39 crore over the next two years on two other projects. Of this, Rs 11 crore will be injected in refurbishing the erstwhile RPRL which is now a company division. The balance Rs 28 crore is to be invested in developing a whole new range of diesel engines for auto-rickshaws in the 8-13 hp range. Despite Greaves' attempts at improving its lot, however, the stock market remains unimpressed with its efforts for the moment, with the company's stock presently quoting at around Rs 24, discounting its 1998-99 earnings by a mere 2.1 times.

Amnesty and Human Rights in the US

A G Noorani

Amnesty International's report on human rights in the US is welcome for two reasons: it confirms Amnesty's reputation for impartiality and it exposes the US's hypocrisy in claiming to be a champion of human rights.

DURING the Emergency, Amnesty International published a pamphlet entitled *AI in Quotes*. It was a delightful compilation of attacks on Amnesty from a wide range of leaders, from Ildi Amin to Indira Gandhi. Amnesty baiting is not confined to such. The so-called mainstream press in India revels in challenging its credentials whenever it publishes any report on the human rights situation in India, especially if it is on Kashmir for that is when the 'super-patriots' are truly aroused.

Amnesty's report entitled *United States of America: Rights for All* is welcome for two reasons. One is that it confirms Amnesty's reputation for impartiality. The other, that it exposes the US's hypocrisy in claiming to be a champion of human rights. The report finds: "There is a persistent and widespread pattern of human rights violations in the US. This is not to say that federal, state or local authorities pursue policies deliberately designed to repress particular groups or violate human rights. Rather, it is to recognise that in the wide variety of jurisdictions across the country, practices persist which result in real and serious abuses. Some arise from individual misconduct, encouraged by an institutionalised failure to hold officials accountable. Others result from inadequate systems of control or an outright refusal to recognise or respect international standards for human rights protection. In some cases, economic policies and political trends are creating conditions in which these violations are becoming more widespread and increasingly severe."

The report focuses on several areas where the authorities have failed to prevent repeated violations of basic human rights: the right to freedom from torture and cruel, inhuman or degrading treatment, the right to life and the right to freedom from arbitrary detention. It shows that police officers, prison guards, immigration and other officials in the US are regularly breaching their own laws and guidelines as well as international standards; that the

authorities have failed to take necessary action to punish and prevent abuses; and that US government policies and practices frequently ignore or fall short of the minimum standards required by the international community.

While successive US governments have used these international human rights standards as a yardstick by which to judge other countries, they have not consistently applied those same standards at home. In some areas international standards offer greater human rights protection than US domestic law, but the US authorities have refused to recognise the primacy of international law.

Much of the report is based on information from human rights groups. Amnesty International researchers have also conducted more than 18 research visits to the US over the past three years, carrying out on-site visits and interviews. Other sources include government agencies, court documents, academics, lawyers, and victims and their relatives. "We extend our thanks to all those who provided information and assistance", the report acknowledges.

By what tests does Amnesty judge countries? Simply by the yardstick that is the corpus of UN documents. To wit: International Covenant on Civil and Political Rights; Convention against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment; International Convention on the Elimination of All Forms of Racial Discrimination; the Convention relating to the Status of Refugees; Protocol relating

to the Status of Refugees; Universal Declaration of Human Rights; Body of Principles for the Protection of All Persons under Any Form of Detention or Imprisonment; Standard Minimum Rules for the Treatment of Prisoners; Safeguards guaranteeing protection of the rights of those facing the death penalty; United Nations Rules for the Protection of Juveniles Deprived of their Liberty; Code of Conduct for Law Enforcement Officials; Basic Principles on the Use of Force and Firearms by Law Enforcement Officials; Principles on the Effective Prevention and Investigation of Extra-Legal, Arbitrary and Summary Executions; Guidelines on the Role of Prosecutors; Basic Principles on the Role of Lawyers; Basic Principles on the Independence of the Judiciary.

The chapter on 'Police Brutality: A Pattern of Abuse' should convince the worst of our chauvinists that India is not being 'targeted' by Amnesty. One can only quote from the report extensively and not merely to expose the falsity of the slurs but also because the excerpts are so instructive: "Police brutality seemed to occur... whenever we uncovered corruption". This was one of the findings of the Mollen Commission of Inquiry into corruption in the New York City Police Department (NYPD) in 1994.

Consider these passages:

There have been numerous deaths in police custody following restraint procedures known to be dangerous. Suspects have died after being placed face-down in restraints, usually while 'hogtied' (where a suspect's ankles are bound from behind to the wrists), or after pressure has been applied to the neck or chest. Such practices can severely restrict breathing and can lead to death from 'positional asphyxia', especially when the subject is agitated or under the influence of drugs...

At least 3,000 US police departments authorise the use of Oleoresin Capsicum (OC) spray—an inflammatory agent derived from cayenne peppers. OC spray inflames

Back Volumes

Back Volumes of *Economic and Political Weekly* from 1976 to 1998 are available in unbound form.

Hitkari House, 284 Shahid Bhagat Singh Road, Mumbai 400 001.

the mucous membranes, causing closing of the eyes, coughing, gagging, shortness of breath and an acute burning sensation on the skin and inside the nose and mouth. Patrol officers in some police departments are authorised to use stun guns or tasers. The stun gun is a hand-held device with two metal prongs that emit an electric shock. The taser is a hand-held device which shoots two barbed hooks into the subject's clothing from a distance; the current is transmitted through wires. In both cases a high voltage 'jolt', typically 50,000 volts, incapacitates the suspect.

Minorities are the worst sufferers:

Members of racial minorities bear the brunt of police brutality and excessive force in many parts of the US. The over-representation of people from minority groups in complaints against the police is undoubtedly due in part to underlying social and economic inequalities; a disproportionate number of people from minorities live in low-income neighbourhoods where police activities are often concentrated in response to higher levels of reported street crime.

There is, however, one big difference between the situation in the US and in India. There is absolutely no move for reform in India. The reports of the National Police Commission have been pigeon-holed. But in the US, "as of June 1998, there were 94 independent oversight bodies...with authority to review complaints against the police, compared to just 13 in 1980. The review bodies (commonly referred to as 'citizen' or 'civilian' review) include civilian complaints review boards; municipal offices; and individual counsel appointed to audit the internal complaints process. Three-quarters of the police departments in the 50 largest cities, as well as many smaller agencies, are now subject to some form of civilian review. However at the time of writing, the police in 12 major cities were not subject to any functioning oversight system."

There are chapters on prison conditions and the treatment of asylum-seekers, the report does a thorough job in exposing US's hypocrisy in its lack of respect for human rights internationally:

Examples include the US government's long-standing refusal to criticise blatant human rights violations by Israel against the Palestinian population; its passivity in the face of gross human rights violations in Saudi Arabia; and its willingness to ignore for many crucial months in 1996 and 1997 massive human rights abuses committed against civilians and refugees

by the armed opposition in Zaire, now the Democratic Republic of the Congo (DRC). Until recently the US failed to effectively oppose the obstruction of UN investigation missions by the DRC authorities. US government officials have denied, ignored or played down massacres of unarmed civilians in Rwanda by members of the army since 1994.

One of the clearest examples of the US's changing attitude to human rights violations in different circumstances is that of Iraq. During the 1980s Iraqi forces committed gross and widespread abuses, including repeated massacres of Kurdish civilians, many of them children, sometimes using chemical weapons. Amnesty International repeatedly appealed for action, yet neither the US authorities nor the UN responded. However, after Iraq invaded Kuwait in August 1990, the US attitude changed dramatically. The US repeatedly cited the Iraqi government's appalling human rights record to gather support for UN military intervention in the Gulf.

There are only two countries in the world that have not ratified the Convention on the Rights of the Child – Somalia and the US.

India ratified the International Covenant on Civil and Political Rights adopted by the UN General Assembly in 1979. The US did so in 1992 subject, however, to numerous reservations. "The Human Rights Committee, the UN body of experts that monitors states' compliance with the ICCPR, has stated that several of these reservations are incompatible with international law. In 1995 it recommended that the US consider withdrawing them, in particular those relating to the death penalty and to the right not to be tortured." It presented its first report to the Committee in 1994, 11 years after India did.

In two respects the records are identical. "The US has not recognised the jurisdiction of the Human Rights Committee and the Committee against Torture to hear individuals' complaints that their rights have been violated under the ICCPR and the Convention against Torture...Human rights experts appointed by the UN Commission on Human Rights to investigate particular types of human rights abuse have not received full co-operation from the US authorities." India's record has been just as bad.

The Report says:

Thousands of foreign military officers are trained in the US every year and US armed forces conduct training programmes and joint exercises around the globe. The School of the Americas (SOA), located in Fort Benning, Georgia, is the best known US training facility, but it is only one of more than 150 centres in the US and abroad where foreign officers are trained. A number of SOA 'alumni' have been implicated in gross human rights violations. US officials maintain that current trainees are vetted to exclude human rights violators and that courses now include human rights training.

Under Section 502B of the Foreign Assistance Act, the US is required to cut off all security assistance to any government which 'engages in a consistent pattern of gross violations of internationally recognised human rights' unless the US president deems that there are 'extraordinary circumstances'. However, Section 502B has never been used to cut off such aid. Likewise, the US Congress has never formally blocked a sale proposed by the US executive branch, although a few sales have been delayed, modified or withdrawn.

Next time Amnesty publishes a report on India our professional patriots would do well to remember its report on the US.

Subsidies and Countervailing Measures

Case for Review of WTO Agreement

C Satapathy

The Seattle ministerial conference in November presents an opportunity for the developing countries to seek a review of the WTO Agreement on Subsidies and Countervailing Measures to ensure that large-scale subsidisation by the rich countries is stopped and small exporters from the developing countries are not subjected to countervailing action.

THE WTO Agreement on subsidies and countervailing measures deals with two separate but related topics.¹ Firstly, it provides for multilateral rules regarding provision of subsidies by WTO members and enforcement of such rules through the dispute settlement mechanism of the WTO. Secondly, it deals with countervailing duties which can be imposed by a WTO member unilaterally on determination that injury is caused to a domestic industry by subsidised imports. Part I of the agreement provides that the agreement applies only to such subsidies as are specifically provided to an enterprise or industry or a group of them. It defines subsidy to be a financial contribution by a government or a public body that confers a benefit. It also defines the concept of 'specificity' to include enterprise-specificity, industry-specificity, regional-specificity (certain producers in a specified region are subsidised) and prohibited subsidy (subsidy is specific to export goods and goods using domestic inputs).

Parts II, III and IV of the agreement deal with prohibited, actionable and non-actionable subsidies. Prohibited subsidies are of two kinds, export subsidies and local content subsidies. The first is contingent either wholly or in part "upon export performance" while the second is contingent either wholly or in part "upon the use of domestic over imported goods". Complaints regarding prohibited subsidies are subject to a rapid (three-month period) dispute settlement mechanism. Actionable subsidies are not prohibited but when they cause adverse effects they can be challenged either through multilateral dispute settlement or through unilateral countervailing action. Adverse effects are (i) injury to a domestic industry of another member caused by subsidised imports, (ii) serious prejudice to the export interests of another member, and (iii) nullification or impairment of benefits accruing

under GATT 1994 (e.g., improved market access may not follow from a bound tariff reduction if undercut by subsidisation). The agreement also establishes a sub-category of actionable subsidies in respect of which the complainant member need only to establish that such a subsidy exists. Since serious prejudice will be presumed in such cases, the subsidising member has to demonstrate that the subsidy has not caused serious prejudice to the complainant. This sub-category includes subsidies greater than 5 per cent, subsidies to cover operating losses, and direct waiver of debt. Non-actionable subsidies cannot be subjected to countervailing action nor can they be challenged multilaterally. These include (i) basic research and pre-competitive development subsidies, (ii) assistance to disadvantaged regions (should not be enterprise or industry specific), and (iii) assistance to adapt existing facilities to new environmental requirements (limited to one-time and 20 per cent of the adaptation cost).

Part V of the agreement specifies the substantive and procedural requirements for investigation and imposition of countervailing measures. Parts VI and VII of the agreement establish the institutional structure, notification modalities, etc., whereas Parts IX to XI deal with rules for transition, dispute settlement, etc. Part VIII of the agreement is of particular interest to the developing countries as it contains rules for special and differential treatment. The developed countries were allowed only three years to phase out prohibited subsidies. Least developed countries and countries with less than US \$ 1,000 GNP per capita (listed in Annexure VII to the agreement) are exempted from the prohibition on export subsidies. Other developing countries have an eight-year period to phase out such subsidies. A developing country is required to remove such export subsidy within two years if it acquires

export competitiveness in the product accounting for a share of 3.25 of world trade in that product for two consecutive calendar years. As far as import-substitution subsidies are concerned, the LDCs have eight years and other developing countries have five years to phase out such subsidies. In the case of specified actionable subsidies, the presumption of serious prejudice does not apply to developing countries. Exporters from developing countries are also entitled to differential treatment with respect to countervailing measures and termination of investigations where the level of subsidy does not exceed 2 per cent (3 per cent for Annex VII countries) and volume of subsidised imports is less than 4 per cent from one developing country (subject to 9 per cent limit from all developing countries).

Cass and Boltuck have investigated in some detail the history and rationale behind countervailing action.² US Tariff Act of 1890 for the first time provided for countervailing duty on imports of subsidised sugar. Initially only dutiable goods were subjected to countervailing action till 1974 when such action was extended to non-dutiable goods also. Though GATT 1947 provided for an injury test for countervailing action, till 1974 the US law did not provide for the same, claiming waiver under grandfather rights. Under the existing US law as well as the WTO Agreement, countervailing action can be taken not only against export subsidy, but also against subsidy relating to production. Article 19.2 of the agreement states that the countervailing duty should be less than the amount of subsidy if such lesser duty would be adequate to remove the injury. Cass and Boltuck have pointed out that under the US law countervailing duty has to be equal to the subsidy. They have also demonstrated that production subsidy results both in higher returns to producers and lower prices to consumers and that a larger production subsidy will produce the same consumer price effect in the export market as a smaller export subsidy. It would be excessive, therefore, to set countervailing duty equal to the production subsidy. Cass and Boltuck are also of the view that in the US, "the administrative calculations of subsidy margins and consequent injury seem built on questionable economics and even more questionable statistics".

As in the case of anti-dumping duty, countervailing duty is also often used more as an instrument of protecting domestic trade than for countering unfair trade

practices. The forthcoming Seattle ministerial conference scheduled to be held in November presents an opportunity particularly to the developing countries to seek a review of the Agreement on Subsidies and Countervailing Measures. Several suggestions are being made in this connection which are worth considering. These need to be included in the Seattle agenda to make it a truly "positive trade agenda".

Article 27.1 of the agreement recognises that subsidies may play an important role in the economic development programmes of developing countries. However, subsidies which are commonly used by the developing countries are included in the prohibited and actionable categories whereas the non-actionable category includes those primarily used by the developed countries. The fact that the subsidies currently being used by the developing countries were earlier being used by the developed countries is also significant. Some of these subsidies are necessary for creation of new industries, diversification of exports, balanced development of disadvantaged regions, creation of jobs as well as improving trade balances and greater participation in international trade. Moreover, Annex VII of the agreement needs revision in this regard to include all the lower and lower-middle income countries as per the World Bank classification. Annex VII should also have the flexibility of allowing inclusion of countries which experience fall in their income level. These modifications will enable the developing countries at the lower end to be exempted from prohibitions on export subsidies. Article 8.1 of the agreement dealing with non-actionable subsidies should also be amended to specifically include export subsidies provided by developing countries to ensure that no action is taken either multilaterally through the dispute settlement route or unilaterally through countervailing action against such subsidy.

The concept of special and differential treatment for developing countries needs to be operationalised in real terms. For example, Article 11.9 of the agreement has a *de minimis* subsidy threshold of 1 per cent ad valorem for developing countries. Similarly, under Article 27.10(b) there is a *de minimis* share of import of 4 per cent for individual developing countries and 9 per cent on the whole below which no countervailing duty investigation can be continued. A better approach would be to have a higher individual limit of say 7 per cent without clubbing imports from different developing countries. Article 27.6 has a threshold limit of 3.25 per cent of

world trade for two consecutive years for applying prohibition on export subsidy. The two-year period could be increased to five years to enable a developing country to have a firm foothold in world trade for a reasonably long period.

In the past, several export promotion schemes operated by developing countries have been adversely questioned under countervailing duty investigations. To remove doubts in this regard, the agreement requires several clarificatory amendments so that exporters are not harassed time and again. Many developing countries do not have a VAT system of taxation under which zero-rating of exports can allow refund of all domestic taxes and duties. Any alternative method of neutralising or refunding sales tax, octroi, cess, etc., by such countries should not be termed as subsidisation. Similarly, aggregated and generalised rates of duty remission should not be questioned in the case of developing countries merely on the ground that individual units are not able to establish the source of inputs. The definition of "inputs consumed in the production process" is currently restricted to inputs physically incorporated, energy, fuels, oils and catalysts under footnote 61 to the agreement. There is a need to expand the definition to include all inputs. It is also well known that the cost of borrowing money is much more in developing countries. Export credits given by developing countries should not, therefore, be considered as subsidy as long as the rate of credit is above LIBOR. The amount of countervailing duty not only needs to be restricted to the extent of injury but also, in respect of developing countries, needs to be additionally restricted to the extent it exceeds the *de minimis* level of subsidy.

A number of developing countries are agitated about the unfair use of countervailing measures by developed countries in order to impede market access for goods from developing countries. They are also equally concerned about the difficulties experienced and costs incurred by their exporters defending themselves against countervailing duty investigations in the developed countries. One suggestion has been made that the governments of the developing countries should be fully consulted before initiating any countervailing action against individual exporters. The need for exploring constructive remedies before applying countervailing duties cannot be overstated in this regard. Developing country members are also concerned about the trade-distorting effect of direct subsidies used by the developed countries in the agriculture sector. Pro-

ducers of developed countries should not be hiding behind fair-trade slogans and shouting for countervailing action while they themselves enjoy subsidies on a liberal scale. In this context, a case in point is that of the US law permitting so-called Foreign Sales Corporations to enjoy exemption from US taxes on their income from US exports. Such exemption is particularly used by the transport, machinery, chemical industries as well as agricultural exporters. Since 1997, the exemption has also been extended to the software industry.³ The US companies are alleged to be channelling over \$ 150 billion of export income involving profits of \$ 10 billion annually through these corporations (mainly set up in tax havens like the US Virgin Island) costing the US treasury above \$ 2 billion in taxes forgone. The EU has claimed in a complaint before the WTO panel that the scheme involves the biggest subsidy in the world trade system and severely distorts international competition.⁴ The WTO panel has since decided against the US but its finding can be further appealed against. Another case in point is the Emergency Steel Loan Guarantee Act recently passed by both the Houses of the US Congress which is likely to provide \$ 1 billion loan guarantees to the US companies. Leon Brittan, the outgoing EU Trade Commissioner, feels that this plan would certainly constitute a subsidy under the WTO rules and that it could lead to countervailing measures from other countries as well as damaging escalation of subsidies.⁵ The WTO Agreement certainly needs a review to ensure that such large-scale subsidisation is not allowed on the one hand and small exporters from developing countries are not subjected to countervailing action on the other.

Right to Constitutional Remedy

Significance of Article 32

Nirmalendu Bikash Rakshit

A mere enumeration of rights, even if it is meticulously worded is not enough. What is needed is a provision for its enforcement, an avenue for redressal. Article 32 of the Indian Constitution enshrines this provision whereby individuals may seek redressal for the violation of their fundamental rights.

THE Constitution of India has engrafted several fundamental rights in Chapter III. But, the writers of the Constitution knew well that a mere declaration of such rights hardly ensures their practical existence in political life. In reality, rights must be enforceable by the judiciary, otherwise they are sure to remain as mere 'paper-rights'. This is why, they provided for a guaranteed remedy in case of infringement of such rights. Constitutionally, they relied upon the superior courts – particularly the Supreme Court – for undertaking this stupendous responsibility.

A mere enumeration of rights, even in the most elaborate and meticulously worded form, is not enough. What is needed, in addition to all this, is the provision for their enforcement (J C Johari, *Indian Government and Politics*, p 109). So, if and when a person feels that he is unduly deprived of any of the fundamental rights, he can, under Article 32 of our Constitution, move the Supreme Court for a legal remedy. In this sense, this article is, really, novel one and as B P Gajendra-gadkar (*Constitution of India*, pp 60-62), a former chief justice of India, has observed, it is "a very distinguishing feature of the Constitution". According to him, it is the "cornerstone of the democratic edifice raised by the Constitution". This observation is true as far as it goes.

Article 32 has four parts:

(i) First, under Article 32(i), an aggrieved person can move the Supreme Court for a legal remedy in case of an alleged infringer of his Fundamental Right. In such case, it is the constitutional duty of the apex court to look into the matter and to provide necessary redress to the affected person.

(ii) Secondly, in such case, the Supreme Court protects the fundamental rights with the help of the constitutional weapon of 'writs'. So, when an aggrieved person eagerly moves the Supreme Court under Article 32, it has to protect the rights by

issuing an appropriate writ for the restoration and maintenance of the rights unduly curtailed by any other person or authority.

(iii) Thirdly, the parliament may, by law, empower any other court with such authority so that it too can act as the protector and guarantor of such rights.

As it is often observed, rights without remedy is a meaningless formality. So, very wisely, the founding fathers have engrafted Article 32 by which the individual may secure a guaranteed remedy in case of the infringement of fundamental rights. Article 32, with its first three clauses, has necessarily done the job. As M V Pylee rightly claims, "the first three sections of the article, taken together, make fundamental rights under the Constitution real and, as such, they form the crowning part of the entire chapter" (*Constitutional Government in India*, pp 60-62).

(iv) Fourthly, clause (4) of the Constitution, however, mentions an exception. When the president proclaims an emergency under Article 352, the provision for guaranteed remedy of fundamental rights remains suspended. In such times, the president may, under Article 358, make a separate proclamation by which Article 32 remains suspended (H H Das, *Principles of Indian Constitution*, p 136). In other words, an individual cannot, during such emergency, move the Supreme Court, even if he feels that he has been unduly deprived of the Fundamental Right guaranteed by the Constitution.

Obviously, it is a black spot on the fair face of the Constitution which claims to stand for democracy and freedom (M V Pylee, *An Introduction to the Constitution of India*, p 117). But B R Ambedkar, the chief architect of the Constitution, observed in the constituent assembly that the interests of the state as a whole are of much greater importance than those of the individual and, hence, individual liberty cannot be allowed to destroy the very

fabric of national security. He observed, "...it is equally clear that in certain cases, where, for example, the state's very life is in jeopardy, these rights must be subject to a certain amount of limitations". Particularly, the Constitution was drafted during a period of horrid ordeal marked by war, infiltration, partition, communal riots and other subversive activities (D D Basu, *Introduction to the Constitution of India*, p 100). This is why, the makers felt that during an emergency, the enforcement of fundamental rights should remain suspended because the unrestrained right of the individual might, in such times, endanger the security of the nation as a whole.

But, in normal times, fundamental rights seem to be 'fundamental'. In the case of *Ram Singh vs Delhi* the Supreme Court observed, "It is our privilege and duty to see that rights which are intended to be fundamental are kept fundamental..." So, the Supreme Court has to intervene whenever a fundamental right has been transgressed upon. J Sastri similarly claimed in the case of *Row vs Madras* that they were "sentinel on the qui vive", and hence, it is their bounden duty to save their rights from being ruined.

Thus, as the judicial sentinel of fundamental rights, they are equipped with some constitutional weapons, known as 'writs', for the enforcement of such rights.

(i) First, the writ of Habeas Corpus (meaning 'you may have the body') may be issued in order to set free a person who is, in the opinion of the court, arbitrarily arrested or detained by the executive authority.

(ii) Secondly, there is the writ of Mandamus. The Latin word 'Mandamus' means 'we order'. The Supreme Court can issue this writ for the reason of directing an inferior court or department to do the needful for protecting or maintaining a Fundamental Right. It is normally used for public purposes to enforce performance of public duties. But the court often enforces some private rights when they are withheld by the public officers.

The writ actually demands some activity on the part of the body or person to whom it is addressed. Whenever a public officer or the government has done an act which violates the Fundamental Right of a person, the court can issue this writ restraining that officer or the government from enforcing that order.

(iii) Thirdly, the Supreme Court sometimes issues the writ of 'prohibition' for preventing an inferior court from doing

something which it is not legally competent to do.

(iv) Fourthly, there is another writ known as 'certiorari' with which the Supreme Court can remove a case from an inferior court to a superior court in order to protect a Fundamental Right.

(v) Lastly, with the help of 'quo warranto', the Supreme Court can protect a Fundamental Right from being violated by a government order based upon favouritism. If a person, for example, is unduly promoted by superseding his seniors, the Supreme Court can, by such writ, quash the order of such appointment for protecting the Right to Equality as guaranteed by Article 14 and Article 16.

As the Supreme Court itself held in the case of *Charanjitlal vs Union*, the individual can move the court only when he claims that his own Fundamental Right has been infringed upon (V D Mahajan, *The Constitution of India*, p 97). The aggrieved person, may, however, seek a particular writ to be issued, but it is the Supreme Court which will decide what writ will be appropriate in a particular case. In *Charanjitlal's* case, it held "Article 32 gives us very wide discretion in the matter of framing our writs to suit the exigencies of particular cases, and the application of the petitioner cannot be thrown out simply on the ground that the proper writ has not been prayed for". In other words, it is the judges, and not the petitioner, who will actually determine the nature of the writs to be issued in a particular case.

UNIQUE PROVISION

In this way, Article 32 has become a novel provision in the Constitution of India and, in reality, it has no parallel in the Constitution of any other country (H H Das, *India: Democratic Government and Politics*, p 128). Our Constitution has, by inserting several provisions (covering Articles 12 to 36) clearly guaranteed various types of rights concerning equality, liberty, religion, education and property. But Article 32 does not give us any new thing, it actually makes room for the guaranteed remedy in case any other right is violated. In other words, it is a fundamental right which can be used to protect other fundamental rights. As Gajendra-gadkar points out, no other Constitution of the world has made a remedial article as a Fundamental Right. In this sense, D D Basu very correctly observes, "Article 32, thus, provides a guaranteed remedy for the enforcement of these rights and

this remedial right is itself made a Fundamental Right, being included in part III" (D D Basu, *op cit*, p 110).

So, when the individual seeks the protection of any fundamental right by Article 32, the court's fundamental duty is to carefully hear the appeal. As it observed in the case of *Ramesh Thapper vs Punjab*, "The Supreme Court is, thus, constituted the protector and guarantor of Fundamental Right and it cannot, consistently with the responsibility so laid upon it, refuse to entertain applications seeking protection against infringement of such rights.

Significantly, Ambedkar was glad that the constituent assembly realised the importance of this article. As he happily declared, "Hereafter, it would not be possible for any legislature to take away the writs which are mentioned in this article". Thus, Article 32 has actually made the Supreme Court the guarantor and protector of the fundamental rights (B C Rout, *Democratic Constitution of India*, p 99). Until and unless the provision of Article 32 is deleted by an amendment of the Constitution, it will help the aggrieved individual place before the apex court his allegations regarding the infringement of his rights.

According to Ambedkar, out of 395 articles of the Constitution, Article 32 was the most important, because it provided for a guaranteed remedy for the violation of any of the rights. As he claimed, "If I were asked to name the particular article in this Constitution as the most important one, without which this Constitution would be a nullity, I could not refer to any other article except this one. It is the very soul of the Constitution and the very heart of it..." (CAD, Vol VII, p 953). Thus, according to the chief architect of the Constitution, this single article surpasses, in value, the totality of the constitutional provisions because it acts as the bulwark of democracy and freedom.

This statement is sufficient to prove that the makers placed a stupendous importance to this provision in order to make the fundamental rights 'fundamental' in the society. So, this provision is extraordinarily important, because it gives meaning and fulfilment to the other fundamental rights guaranteed by the Constitution.

It has been pointed out that the concept of 'judicial review' has been introduced in our Constitution by which the Supreme Court can examine the constitutional validity or otherwise of a legislative act or an executive order (W H Morris Jones,

The Government and Politics in India, p 42). In case an executive order or legislative enactment violates any of the fundamental rights, the Supreme Court can, under Article 13(2), declare it unconstitutional and void. So, every law or act must conform to the fundamental rights as enshrined in chapter III. Grenville Austin rightly (in *The Indian Constitution: Cornerstone of the Nation*, p 114) observes that the heaps of applications before the Supreme Court proves that the people of India are very conscious of their fundamental rights and that they regard the Supreme Court as the guardian of the rights and liberties of the citizens.

Some critics, however, think that financial disabilities have virtually taken away the real significance of Article 32. Legally, every citizen has equal opportunity to move the court for seeking remedy for the infringement of his rights, but the lack of finance often acts as the stumbling block. Once a British judge said, "Justice is open to all – like the Grill-Room of the Ritz Hotel". The euphemism is, however, equally applicable to the case of India. Lack of means often implies the lack of access to the court and, thus, what is legally granted is financially denied to the vast majority (Anup Chakraborty, 'The Judiciary and the Ordinary Citizens in India', *The Modern Review*, August 1973).

It is, of course, true that in order to enlarge the scope of such constitutional remedy, Article 226 is also engrafted in the Constitution. So, in such case, an affected person may also move to the high court which is often residually nearer than the Supreme Court. Thus, so far as the protection of Fundamental Right is concerned, the Supreme Court and high courts enjoy concurrent jurisdiction as the latter can, just like the Supreme Court, issue the writs for the enforcement of fundamental rights (G N Joshi, *The Constitution of India*, p 214).

But it hardly benefits the ordinary man because the system itself is dilatory, clumsy, tiresome and costly. Even if the case is lodged before the high court, the aggrieved person has to spend much time and pay a huge sum in order to get the remedy. This is why, instead of seeking legal redress, most of the affected person choose to bear with the injustice meted out to them.

Though five decades have passed since the making of the Constitution, we have failed to establish either social justice or economic equality. So fundamental rights may practically be regarded as some con-

stitutional privileges only for a section of the people, because despite the existence of some remedial measures, ordinary people cannot hope to restore them in case of their actual infringement.

Above all, the entire judicial process is artificial and alien to the ordinary people. Often the law does not seem to be Indian in spirit, form, content and even in language. The slow-moving legal machinery becomes, in fact, a negation of justice to such people (Justice P B Mukherjee, Inaugural Speech at the Annual Conference of the West Bengal Lawyers' Association, March 21, 1971). The Law Commission has pointed out that nearly 36 per cent of cases available for disposal during a year remains unresolved and that the slow movement of cases results in the accumulation of arrears which causes further delay, producing a snow balling effect.

Of course, a right without remedy is a meaningless formality (A C Kapur, *The Indian Political System*, p 143). This is why, our Constitution has not only enlisted them, but has also made them enforceable by some written provisions. Yet they are limited by various ways. During an emergency, they can be suspended by presidential proclamation and, in normal times, they may be curtailed by preventive detention acts, amendments and other restrictive measures. As such, often the judiciary, despite its eagerness, finds a little scope to step in.

For all these reasons, it is alleged that the people of India practically enjoy fewer rights than they are guaranteed. The chapter on fundamental rights may, hence, be called 'Limitations on Fundamental Rights' or 'Unfundamental Rights'. Some critics even point out that the benefits of the remedial provisions have practically been taken away by various factors of realistic life. These rights may well be regarded as double-edged weapons, because what is given by one hand is taken away by the other (K V Rao, *Parliamentary Democracy in India*, p 146).

Thus, it is a cardinal truth that fundamental rights India are hedged with many limitations and also that the remedial provisions (Articles 32 and 226) have little practical use. However, the makers thought that they had aptly created an effective-enforcement-machinery. Particularly, as D D Basu opines, the sole object of Article 32 is the enforcement of the rights guaranteed by the Constitution (*Constitutional Law*, p 110). But procedural complexities and financial incapacity are sure

to take away much of the merits of the original scheme. As a matter of fact, rights of a man have no teeth unless they are protected by the Constitution itself. It is to be noted that the Soviet Constitution also mentioned some rights, but they were not practically enforceable. The unwritten British Constitution has, however, no place of such express rights, though the people enjoy them through the conventional force. In America also, there is no specific provision for the issue of writs for protecting

the rights, but the judiciary carefully keeps them fundamental.

Where right is, remedy there must be, because a right without remedy is a rope of sand (A G Agarwal, *Comparative Study of Modern Indian Constitution*, p 428). In this sense, the provisions for the enforcement of fundamental rights is a most novel feature of our Constitution. But the constitutional mechanism is not enough, because, after all there remains a big gap between the lip and the cup.

Call for Papers

Second Annual Conference on Money and Finance in the Indian Economy

The Indira Gandhi Institute of Development Research (IGIDR) will be hosting its second annual conference on **Money and Finance in the Indian Economy** during November 30 to December 2, 1999. The conference will consist of invited papers, which would be state of the art surveys of various aspects of the broad Money and Finance area and contributed papers, for which submissions are invited. Although papers on all topics in the broad money and finance area are solicited, we would particularly welcome papers on the following topics:

1. The design of Monetary Policy in a Liberalizing Economy: Targets and Instruments;
2. The coordination of Monetary Policy with Fiscal and other Policy Instruments;
3. Financial Innovations and the Conduct of Monetary Policy;
4. Capital Account Convertibility, Currency Crisis and Global Financial Institutions.

Complete papers should reach Raghbendra Jha at the address noted below by **October 15, 1999**. All papers will be refereed. Authors will be informed by end October. Authors of accepted papers may also be requested to act as discussants for other papers. Some subsidy for travel to and from the conference for authors (within India) of accepted papers may be available. Accommodation and local hospitality will be arranged by IGIDR. A proposal to publish revised versions of selected papers is under consideration.

Kirit Parikh (Director) and Raghbendra Jha (Professor)
Seminar Coordinators

Address for Correspondence:

Chs Centre for Health Studies

TATA INSTITUTE OF SOCIAL SCIENCES

ANNOUNCEMENT OF RESEARCH AND VISITING FELLOWSHIPS

The Centre for Health Studies (CHS) at the Tata Institute of Social Sciences, Mumbai, is a Ford Foundation funded project which had commenced its activities since 1993. The broad objectives of the CHS includes initiating research and field action projects on health issues, generating and disseminating vital information through workshops, seminars and training programmes, and strengthening of capacity among social scientists, health activists and professionals in the field of health.

RESEARCH

The CHS has identified three priority themes for focused research in the coming years. They are : (a) Primary Health Care in India, (b) Sexuality and (c) Structural Adjustment Policies and Health. Study groups consisting of Faculty members from the Institute have been formed to initiate extensive review, launch empirical studies and establish networks. Series of workshops are being planned to share and document research in these areas as well. Researchers, scholars, activists or NGOs studying and working on these issues are invited to contact the Facilitators of the study groups with a one page note about the work being carried out in these areas, at the earliest.

Primary Health Care – Dr. Siva Raju, Unit for Urban Studies, e-mail: sivaraju@tiss.edu

Sexuality in India – Mr. Anil Kumar, Unit for Child and Youth Research, e-mail: anil@tiss.edu

Structural Adjustment Policies and Health – Dr. Lakshmi Lingam, Women's Studies Unit
e-mail: lakshmi1@tiss.edu

VISITING FELLOWSHIPS

The CHS offers Senior Fellowships to individuals having a Masters degree in Social Sciences/Social Work/Public Health/Preventive and Social Medicine; and a Ph.D. with 10 years of research/field experience preferably on the social aspects of health. The Senior Fellow will receive a consolidated sum of Rs. 15,000 p.m. along with some allowances for contingencies. The duration of the fellowship is for 4 months. Durations shorter than this are possible. The Junior Fellowship grant is offered to individuals having a Masters degree in Social Sciences/Social Work/Public Health/Preventive and Social Medicine and a Ph.D. with 5 years. The Junior Fellow will receive a consolidated sum of Rs. 12,000 p.m. along with some allowances for contingencies. The incumbents of these fellowships may be called upon to contribute to the research, training and teaching programmes of the Institute. Where the area of the work coincides with the interest area of any of the Teaching Department or Research Units, the incumbents will be attached to the said Dept/Unit. Family accommodation on the campus is not available. Individual accommodation in the Research Hostel / Guest House may be available, subject to vacancy. Interested persons may send in their Resume, a two page research proposal and three best publications, within one month from the time of this announcement to the address given below. Individuals who can send in these particulars within 3 weeks from the date of this advertisement, would be considered for the current semester. Employed persons are expected to seek requisite permission from their organisations prior to submission of the application.

Dr. Lakshmi Lingam,
Co-ordinator,
Centre for Health Studies,
Tata Institute of Social Sciences,
Post Box No.8313, Sion-Trombay Rd.,
Deonar, Mumbai – 400 088.

Changing Dimensions of Electoral Politics

Rekha Chowdhary

One of the most notable accomplishments of Mufti Mohammed Syed and his daughter Mehbooba Mufti had been to steer the Congress towards providing a healthy democratic opposition to the National Conference. Their resignation from the party affects the Congress adversely and has ramifications for politics in Kashmir.

THE Congress Party in Jammu and Kashmir has faced a set-back as Mufti Mohammed Syed, the sole representative of the party from the state in the dissolved Lok Sabha, and his daughter, Mehbooba Mufti, the leader of the Congress Legislative Party, deserted it to float their own regional party, People's Democratic Party. The decision of the Muftis to abandon the Congress on the eve of the Lok Sabha elections is bound to have a definite impact on the poll prospects of the Congress in the state, specifically in the Valley of late, the Congress seemed to have carved a space for itself mainly because of the efforts of the father-daughter duo. They have been consciously nursing the politics of Kashmir in what may be termed as a 'people oriented' approach - identifying with the urges and aspirations of the people, condemning human rights violations and calling for an unconditional dialogue with the militants to resolve the tensions in the state. The most notable elements of their political approach have been their political communication with the people as well as their political visibility, which they have been successful in maintaining throughout this period. Any situation involving the people anywhere in the state, inevitably brought them to the political scene. Thus one could see their pictures all over the local newspapers after any major act of violence - listening to the gruesome stories of the victims and sympathising with them. The healing touch that the people of the valley need very much after a prolonged period of turmoil was seen to be provided by them.

For the Congress high command, all this may be a calculated political move rather than a genuine response to people's problems. Yet in the context of the political tangle that the valley is faced with it is difficult to dismiss the implications of this kind of politics. Mehbooba Mufti, in her letter of resignation to the Congress president, Sonia Gandhi, has specified the core

of this politics by posing the question: "You want the land of Kashmir or also the people?" It is the political response of the people of Kashmir that Muftis are targeting. Despite the restoration of the political order in the valley, people continue to be alienated. In fact, they are much more alienated now as compared to the initial years of the political upsurge that accompanied militancy. In the early 1990s, their alienation against the Indian state was reflected in their distinct support to the militancy and their participation in demonstrations of massive nature, chanting the slogans of 'azadi'. Now almost a decade later, they seem to be alienated from the movement as well. They are a wearied lot; drained and consumed by violence all around and thoroughly disillusioned - as much by militancy as by Pakistan. So jaded and apathetic have they become that even a situation like Kargil fought in their name both by India and Pakistan has not been successful in evoking any kind of emotion among them.

In retrospect, the people of Kashmir see the movement not in terms of gains but in terms of losses. Whatever the official figure, they count their dead to be more than 50,000. Beside the huge loss of life, it is the overall effect of the upheaval on the life of the community that the people of Kashmir mourn. It is a community that has been kept at siege continuously for 10 years now. A generation has been exposed to the protracted violence leading to psychological effects. Meanwhile, there are social and economic costs that the community has to bear. The health of all social institutions has been affected, the economy has been shattered and development has been totally halted. All this has created a wounded psyche in Kashmir, which needs to be taken seriously. In national politics there is no political agenda that takes into consideration the political psyche of people of Kashmir. Kashmir figures in the national politics in a big way but not

the people of Kashmir or their political responses.

The Congress has a history of being utterly insensitive to the responses of people of Kashmir which is why the people of Kashmir have been quite antagonistic to it, especially after 1984 it engineering defections in the National Conference leading to the dismissal of the legitimately elected government of Farooq Abdullah and lending its support to the G M Shah ministry. Such was the popular disapproval of this party in the valley that its alliance with National Conference in 1986 led not only to the latter's undoing but also the disruption of the political order itself.

It is in this context of the generally prevalent hostility towards Congress in the valley that the leadership of the Muftis and their politics had its relevance. The politics being pursued by them at the grass roots levels made for the possibility of locating the Congress in the local politics and inculcating in it a sensitivity towards the local urges was increasing. Under their leadership the Congress could have gained acceptance in Kashmir.

Yet, there were other implications of the politics being pursued by Muftis, for the Congress as well as for the politics of Kashmir in general. One of the most notable accomplishment of the father-daughter team in recent years had been of steering the Congress in a direction where it could provide a healthy democratic opposition to the National Conference. Despite the dent made in its politics by the militancy in the last 10 years, the National Conference continues to hegemonise the electoral politics of the valley. One of the reasons for this is that it has been the only party operating within the democratic space which represents, at least symbolically, the political ethos of Kashmir. This ethos is governed by the logic of an autonomous political space and an urge for political autonomy. The kind of politics being pursued by the Congress under the Muftis could have developed the potentiality of challenging this hegemony. The politics of the Muftis overlaps the politics of the National Conference. Operating in the same paradigm, its political ideology runs on a similar pattern - with same issues of political dignity and identity and same emphasis on autonomy. It was in this vein that the Congress could have gained from the crisis of legitimacy faced by the National Conference at this moment. Despite its massive majority within the assembly the Conference has not been able to deliver the goods. The promised jobs have not materialised, corruption has not been checked, militancy is unabated and the human rights abuses are galore.

With the Muftis leaving the Congress, it remains a party as alien to the political responses of people of Kashmir as always. In the coming parliamentary elections it has not only to face the challenge of the National Conference but also of the Multi-led People's Democratic Party.

The implications of the Muftis launching a regional party are not limited to the Congress only. It will have definite ramifications for the National Conference as well. At least, the Conference will not be able to take its victory for granted. It will have to face a tough fight in those areas which the Muftis have been nurturing for some time now. But it is beyond this election that one may be able to see the real impact of the newly launched party. It may very well initiate the interactive politics very much needed in the valley. The hegemonised politics of the ruling party as well as the failure of the oppositional politics to evolve itself, both have had disastrous effects in Kashmir. It was due to the absence of an effective oppositional politics in Kashmir that most of

the political grievances of the common people were articulated and voiced in the extra-systemic space. In terms of the potential of the new regional party to provide a democratic alternative to the ruling party, the Muftis in past few years have established a reputation for their oppositional politics. They have been actively engaged in censuring the party in power. As leader of the Congress Legislative Party, Mehbooba Mufti was known for her firebrand speeches in the assembly, raising issues not only with a view to corner the government but also to articulate alternative political options. It is difficult to gauge the chances of the political success of the party floated by the Muftis. Electoral politics is governed by the logic that is quite complex. Yet, one thing is clear: the politics pursued by this party has the potential of rejuvenating the electoral scene in the valley. By boldly raising issues, which other parties shy away from it is not only bound to bring greater credibility to the electoral exercise but also more seriousness to democratic politics.

is paid to the shrinking of the state is also the increasing hiatus between the state and private sectors in terms of salaries and the impact this has on the courses of study the youth wish to pursue.

On the first drawback we find proponents as well as opponents sharing an assumption although it is doubtful if they are aware of it. This assumption derives from the dichotomous framework referred to above. Opponents can perhaps be forgiven for assuming that efficiency/merit/excellence, etc., will always be compromised if reservations are practised. This is not a sound argument but given the position taken by the anti-reservationists it is understandable. What is surprising is finding supporters and fervent advocates appearing to endorse this stand. However, a caveat should be entered. Proponents posit this apparent irreconcilability between merit and reservation within a framework which begins by questioning the former at the level of the concept itself.

The standard argument runs as follows. The yardstick by which merit is sought to be measured is derived from the standards set by the ruling or the dominant elite and is indeed derived from its perception of what is of value. The elite ensure that there is an exclusive club of the merited which operates more or less on the lines of a closed shop and the rest of society is ensnared into this trap which engenders a false conception of what constitutes merit or excellence (incidentally these terms are used interchangeably in this note). Against this background the argument for reservation commences with an attack on the existence of a yardstick of merit.

ASSESSING MERIT

Obviously there is some truth in this argument too. It does not require much analytical insight to suggest that the standard setters are those who are able to wield influence in relation to issues that matter in this context. However, in no society has the yardstick for assessing merit remained constant. On the contrary it has always responded to changes in values as well as perceptions and social need. A somewhat simple example relates to the major alterations that have taken place between the pre- and post-independence India. These changes are due in part to the entry of hitherto marginalised groups into higher education, white collar employment and the like. Another good example is from the princely state of Mysore where the brahmins held a preponderant proportion of jobs under the state despite their numerical smallness and the fact that their literacy was less than 25 per cent and literacy in English less than 10 per cent

Reservations: Seeking New Perspectives

V K Natraj

Critics of reservation often look upon the policy as the arch villain responsible for the dilution of standards everywhere without taking cognisance of the changes in the economy and polity in recent times.

IN the aftermath of the recent gory railway accident which has claimed hundreds of lives there is, not unnaturally, an attempt at blame-fixing. As so often happens we are told that human error was probably the cause and a few officials have been suspended and an enquiry ordered. A former high ranking official of the Railway Board, while discussing this avoidable tragedy on a TV programme, drew attention to two issues whose importance extends beyond this accident. He commented upon the woefully inadequate training imparted to the staff. This is quite likely true being a ubiquitous phenomenon in our country in most fields. Secondly, he commented upon the adverse consequences of reservation and gave the instance of hundreds of employees being regularised due to the insistence of the minister concerned and apparently this was done without reference either to need or competence. This is not altogether surprising since we are all aware of the 'spoils system' which operates in relation to employment. However, we need to look a little more closely into the charge against reservation.

Reservation is an issue that provokes

strong feelings. Its status reminds us of Albert Hirschman's observation decades ago on how the price mechanism served to divide the economic profession into two categories, one extolling it and the other criticising it. Similarly with reservation we have supporters who consider it a near panacea for the ills of a society for long riven by social and economic differences. Critics of reservation look upon the policy as the arch villain, responsible for dilution of standards. As a doctoral pupil of mine once put it: "When there is a train accident it is at once presumed that the driver must have been a beneficiary of reservation!"

Discussions of reservation suffer from two principal drawbacks. In the first place merit and reservation are posited as being antithetical to each other. This is done, if not explicitly, certainly by implication. The framework of the discourse is essentially dichotomous. Secondly, the reservation dialogue of the present does not seek to accommodate the changes which are sweeping across the economy. The idiom of the discussion is what it was when state sector employment was a major factor which it no longer is. Little heed

— of course these not very impressive percentages were higher than those of other castes. The point is that the non-brahmin movement was able to secure better representation for the backward castes and in doing so caused some changes in the manner in which efficiency was assessed. Also to be noted is the vitally significant fact that the non-brahmins, by and large, sought concessions in order that they could compete with the elite and did not seek to dilute standards. Indeed when the brahmins questioned the legitimacy of the policy of reservation the non-brahmin leaders were quick to point out that the former had been the first to seek reservation by insisting that the Mysore civil service examination should not be open to candidates from outside the state. It was argued that this was solely because the Mysore brahmins were not sure of competing on equal terms with the better trained men of their own caste from Madras presidency. The non-brahmin leaders forcefully argued that they were seeking precisely the same protection so that their people could begin to compete on a level playing field with the brahmins. There was not much questioning of the principle of excellence.

In recent times the complexion of the discourse has altered in that the necessity of a yardstick is in question. There are two possible reasons for this. One is that over the years the numbers of those aspiring to play in the big league of higher education and white collar employment has increased visibly. The opportunities, though, have not kept pace with the increasing demand. Secondly, a process of differentiation among the non-brahmins has been taking place. Added to this there is competition among the backward classes and even the scheduled castes although this may not have occurred to the same extent with the scheduled tribes. In this situation it is hardly surprising that there is a sense of frustration among the potential beneficiaries of reservation. Above all we live in a context in which norms are rarely adhered to and there is a complete lack of faith in the ability of the political system to be a neutral arbitrator of competing interests. In the spoils system so much in evidence today this constellation has logically led to an attack on the very existence of a criterion of excellence. At the same time we notice a different but related trend. Those intermediate castes which have made use of reservation in some degree begin using the idiom of excellence and at times even border on opposition to reservation.

It is particularly unfortunate that in this process something fundamental is lost sight of. It is the realisation that no society has

advanced without the pursuit of excellence. As discussed above the criteria are forever in a state of change. The saddest part is that in this altered discourse it is the genuine aspirants and the ones with the most legitimate claims for protective discrimination that are getting hurt. Once the notion of excellence is disputed it becomes all too easy to confer the advantage of reservation not on the most deserving but on those who have 'access' and influence. Apart from the problem that those who require protection do not receive it this state of affairs results in yet another disaster in that undeserving beneficiaries show the scheme of reservation in poor light. It helps critics to adopt an attitude of "I told you so" when performance is below the desired level. This is not all. It enables wrong selections, from among other sections including affluent backward castes who manage to stay on the reservation wagon (very often undeservingly) to be justified. After all every kind of inefficiency can now be easily ascribed to numerically large categories of beneficiaries like the scheduled castes — they are numerically large because of the percentage of reservation and because there is a tendency to treat SC as a homogeneous group. It is not uncommon in Karnataka to hear upper castes expressing anger against the SCs and be seemingly unaware that their competitors are generally from the other backward classes. It is amazing to find reservation being spoken of as if it applies only to the SCs and the STs. One is almost tempted to see in this a hidden agenda to discredit the most deprived groups as well as protective discrimination. The situation is rather similar to the anti-immigration protests in western countries where unemployment is attributed to immigrants unmindful of the unwillingness of local people to do the jobs which the former take.

QUALITY VS EQUALITY?

It is necessary then to place the issue of reservation in a new framework which explicitly takes cognisance of the changes occurring in the economy. Also the frame of discourse should seek to avoid the dichotomy between quality and equality, rather the focus should be on blending and harmonising the two. Earlier in the absence of reservation elite domination kept several sections of society outside the mainstream as it were. Insistence on quality as perceived by the elite resulted in a near monopoly for the privileged sections. Protective discrimination, despite its several faults especially in implementation, has opened the arena to more people and to an extent has helped the participation

of previously marginalised groups. This is not to suggest that reservation has succeeded in its panacea role but it cannot be denied that it has played some role at least in the direction of democratising entry into what I call the 'big league'.

However against the backdrop of the trends described above little effort is made to combine quality and equality. It is forgotten that lack of attention to equality today will perpetuate inequalities and at the same time neglect of quality will mean that tomorrow's economy and society may not possess the resilience and strength to promote equality. In order to make this a reality it is essential that the relatively better-off are kept out of the ambit of reservation thereby avoiding the 'free ride' problem and that within every category of reservation are also the general ones the accent is on quality. It is obvious that in choosing among the reserved categories the welfare of the most disadvantaged is constantly kept in mind.

An important area where the interests of the youth in the SC and ST categories in particular are wholly compromised is in education. A large proportion of these young people are virtually first generation learners and language is a serious handicap. Predictably this is specially so with English. Unlike youngsters who come from educated families these have no opportunity to hone their language skill in English at home and their schooling does little to develop the ability. This is the reason many of them find it difficult to cope with the demands of higher education and our system offers them no help. From the outside there are voices urging the virtues of instruction in the mother tongue. These voices are not only the politicians' but of the literati. While no objection can be raised at the level of theory to this prescription the fact is that children from deprived backgrounds have their problem compounded by denial of access to English. Further, since English is still much sought after and English medium schools continue to thrive — they are patronised often by votaries of the mother tongue/regional language, indeed one suspects that many of them start preaching after their children are safely out of school (otherwise the wife/mother is readily available to be made a scapegoat) — there emerge two clear divisions in society-based essentially on language ability. Naturally the deprived also end up having no access to high paid non-state sector jobs which will continue to be the haven of the privileged.

[This is a modified version of the author's paper titled: 'Reservation: Quality and Equality' published by the National Institute of Advanced Studies, Bangalore 1998.]

Politics of Fragmentation

Manjushree Thapa
Hari Roka

The changing pattern of political parties in the country appears baffling. Whether large or small these parties have proven unstable over these years with personality clashes and petty quarrels causing splits and realignments rather more often than genuine difference of opinion on national or international issues.

A DECADE after the 1990 restoration of democracy, Nepal has 93 recognised political parties, most of them vying for legitimacy. Six have successfully established themselves as national parties: the Nepali Congress Party, the Nepal Communist Party (United Marxist Leninist), the Nepal Communist Party (Marxist Leninist), the Rastriya Prajatantra Party (Thapa), the Rastriya Prajatantra Party (Chand) and the Nepal Sadbhavana Party. About six more are considered significant political forces. Whether large or small, these parties have proven unstable over these years, with personality clashes and ideological battles played for all to see in the headlines of party-backed weeklies, often leading to a breakaway splinter group or to a down-the-middle split.

In the 1999 general elections voters surprised political pundits, and seemingly even themselves, by giving a majority of 111 seats in the 205-house of parliament to the Congress Party. Many intellectuals were quick to praise the maturity of the Nepali voter (who had acted much more wisely than their Indian neighbours, it was said) for rejecting the kind of round-robin coalitions which had frustrated governance for the past four years. A more modest explanation for the Congress majority may come from the fact that its major opposition, the Communist Party of Nepal (UML) had split into two just a year before the general elections. The UML and the breakaway Communist Party of Nepal (ML) waged fratricidal battles with each other during the elections, often supporting the Congress or other parties in the hopes of decimating each other. This strategy paid off for the UML, which won a total of 71 seats and succeeded in eliminating the ML from parliament. The Congress Party was left celebrating the most victory parades.

Because the UML-ML split was so obviously self-destructive to both the parties involved, its rationale remains somewhat baffling to all but those respon-

sible for it, who maintain that the breakup stemmed from ideological differences. It is true that ML members, then part of the minority wing of the UML, differed sharply with the majority over the 1998 renewal of the Mahakali Treaty with India. The minority maintained that the treaty upheld greater Indian use of the waters of the Mahakali river along the western Nepal-India border. They also clashed with the majority in demanding that Indian troops be removed from Kalapani, an area along the river where border demarcations were, and still remain, in question. And while the majority favoured the proposed construction of the Pancheswor Dam along this same river, the minority opposed the project on grounds that its agreement would grant India unequal water sharing rights.

In the elections the ML thus positioned itself as a nationalist force and accused the UML of kowtowing to the interests of the Indian government. There was, however, little in the two parties' election manifestos to attest to an ideological divergence between them. Both parties remained committed to the somehow-communist principle of *janatako bahudaliya janabad* or 'people's multiparty democracy', a socialist stance carefully worded to avoid the taboo word 'socialism'. Both identified themselves as the party of the poor. And both managed to win voters' trust based on their identical platforms. Jointly, the UML and the ML garnered 37.12 per cent of the popular vote, beating the Congress Party's 36.14 per cent.

Informally, party workers tend to identify the cause of the UML-ML split as being cultural rather than ideological. With its heated intellectual debates and lengthy deliberations extending all the way down the ten-tiered party structure to approximately 80 per cent of the wards throughout the country, the joint UML was known for its comparatively participatory decision-making process. (The Congress Party, by contrast, has tended to centralise decision-making power in the hands of the central

working committee and the party president.) Still, according to workers, the UML majority did not see any gain in tolerating the minority or engaging in dialogue over differences. The party – or more specifically, its leaders – sought to surround themselves with supporters and sycophants, and to eliminate detractors. The party lacked a democratic culture.

Despite the bitter accusations and counter-accusations exchanged till recently by the ML and UML, there are indications, now, that party leaders are conferring over the prospects of a merger. The reason for this union can easily be found in their losses at the polls. Yet if the sharp ideological difference over Mahakali river-related issues remain unresolved, and if there is no significant change to the party culture, their rationale for uniting could end up just as baffling as their rationale for breaking up.

The rest of the splintered left of Nepal seems to be following a similar move towards merging and regrouping. Currently there is talk of unity between two small underground parties, the Nepal Communist Party (Masal) and the Unity Centre. (Both these parties conduct elections from other above-ground platforms, respectively the Rastriya Janmorchha with five seats in parliament and the Sanjyukta Janmorchha with one seat.) There is also speculation as to the fate of the Nepal Communist Party (Maoist) which has since 1995 waged a guerilla 'People's War' against parliamentary democracy, inciting violence and also falling victim to brutal government crackdowns that have alarmed human rights activists. The Congress government is hoping to use a combination of force and incentives to put an end to the Maoist insurgency, but efforts so far have yet to yield good results.

No matter how united the communist parties of Nepal may become, they will perhaps always fall into three ideological camps. Centremost is the democratic camp consisting of the UML, ML and the Nepal Workers and Peasants' Party which has one seat in parliament. To their left are the traditional communists, comprising of the Masal and the Unity Centre. This camp rejects the UML/ML's principle of 'people's multiparty democracy' in favour of 'naya janabad' or 'new democracy', a somehow-democratic system that enforces co-operation between political parties which all serve communist ideals. The Maoists, on the extreme left, advocate nothing less than a Chinese-style peasants' revolution.

The communist parties are not alone in their displays of instability, in their proclivity to fragment and unite unpredictably.

In 1997, the conservative Rastriya Prajatantra Party split into two remarkably similar parties named after their leaders: RPP (Thapa) and RPP (Chand). The two were said to differ in their proximity to the Royal Palace and in their nationalism vis-a-vis India; but with identical programmes and with some members even floating back and forth between them, the split seemed to reveal ego rather than ideological clashes. With 19 seats in parliament at that time and 11 today (all belonging to the Thapa faction), this split does not seem to have served these conservative parties well. There is now, as there has been many times before, speculations of their possible union.

The case of the ruling Congress Party is more unique. This is a party that, in the words of a senior diplomat, will neither break up nor unite. Since forming its first government in 1994, the Congress has been known for its deep, and usually embarrassingly public rifts. Prime minister Krishna Prasad Bhattarai currently leads one faction within the party, a faction which seems to be losing ground to the more powerful faction led by party president and former prime minister Girija Prasad Koirala. There are also smaller sub-groups

within the party, most notably a group led by former prime minister Sher Bahadur Deuba; but these sub-groups tend to be unstable, often shifting their loyalties between the Bhattarai and Koirala factions.

The clashes within the Congress Party are unabashedly power-related. With the exception of a few leftover socialists from the time of the party's origins, Congress leaders are equally committed to waiting for market miracles to save the nation, sometimes promising to turn Kathmandu into Singapore, and at other times the whole nation into Switzerland. Much to the embarrassment of intellectuals close to the party, the Congress' most heated debates centre not on policy matters, but on who will get a ticket from which electorate, and which faction will control the central working committee. In the 1994 elections, very strong objections over ticket distribution led a small dissident faction to splinter off. This faction quickly plummeted into political oblivion. Though there were no such splinter groups in this last election, party members did wrangle fiercely over the distribution of tickets.

Given to positioning themselves as the Nehru dynasty of Nepal, the Koirala family seems determined in its pursuit to lead

the Congress and the nation. Along with his political aspirant daughter Sujata, G P Koirala is flanked in the party hierarchy by niece and former deputy prime minister Shailaja Acharya; nephew and party general secretary Sushil Koirala; sister-in-law and former minister of women and social welfare Lila Koirala; brother-in-law and minister of agriculture Chakra Bastola, and sister-in-law Nona Koirala. While many applauded G P Koirala's concession of the prime minister post to Bhattarai after the 1999 elections, it is clear that he has no intention of loosening his stranglehold over Congress politics. This last July Koirala restructured the central working committee, removing many Bhattarai loyalists and replacing them with his own supporters. Those threatened by this move have grumbled vocally; but such grumbling and even shouting, name-calling, slandering – the Congress party is used to. This is one party in Nepal in which a split could be easily explained. But the party keeps staying together through bitter words, through acrimony and accusations and bad blood. In this case it is not the fragmentation of the party, but how the party manages to prevent fragmentation, which is baffling.

MODERN MONETARY THEORY: AN EXPOSITION

Kishore Kulkarni, Metropolitan State College of Denver, Denver, Colorado.

This book is written for undergraduate (B A or B Com.) students at the Indian universities who have taken at least one Macroeconomic course. It deals with macro-monetary economic concepts in complete detail and makes them understandable to economics students. The book consists of 21 chapters – many of which are theoretically rigorous. It builds a macro model of an economy with the help of such famous macroeconomic concepts as IS-LM, Aggregate Demand-Aggregate Supply, Phillips Curve, Crowding-out, Expectations Theories, Purchasing Power Parity (PPP) Theory and Balance of Payments (BOP). It also includes applied theoretical chapters such as application of crowding-out, PPP, demand for money to the Indian conditions, and India's BOP movements.

The analysis in every chapter is carried out with as little mathematics as required for the exposition, and "simplicity in explanation" is considered as of paramount importance. Most of the explanation is carried out in terms of graphs. All figures are kept simple and there is more emphasis on economics rather than on statistics and/or mathematics. There is also some policy-oriented chapters on such topics as the anticipated full flexibility of Indian Rupee and Impact of Monetary policy in case of India. In general, the present book is the most expository, thorough, simplistic and applied monetary economics in the Indian market. The book springs out of Prof. Kulkarni's successful textbook in USA published by Kendall/Hunt Publishing Company, Dubuque, Iowa that is in the third edition. Besides these books Prof. Kulkarni has published two other research books and has authored 45 refereed journal articles many of which have appeared in famous Indian journals. He is considered as an authority in Monetary and International Economics areas. He has been awarded Outstanding Faculty Researcher/Scholar Award, but to him of no less significance is the nomination by his students in the Who's Who Among America's Teachers.

Power Relations and Panchayats in UP

U Kalpagam

Unequal Partners: Power Relations, Devolution and Development in Uttar Pradesh by G K Lieta and Ravi Srivastava; Sage Publications, New Delhi, pp 297, Rs 395 (cloth).

THIS book explores aspects of dominance in rural Uttar Pradesh. Its primary focus is the role and performance of village panchayats in development. Through an analysis of ground-level reality in six villages spread over three districts from eastern, central, and western Uttar Pradesh, the study examines the constraints and potentialities of devolution of power and money to the lowest level decision-making authority, the village panchayat. The opening chapter traces the history and highlights some of the critiques of panchayati raj institutions, and notes that the isolation of village democracy from party politics as hitherto conceived was an important factor in its failure to have any significant impact on rural development. Although the transition towards a new model of open democratic participation since the 73rd constitutional amendment in 1993 is a significant departure, the efficacy of the present model in the authors' view is based on the assumption that the highly unequal access to resources in rural areas will be modified.

The next four chapters provide a detailed analysis of the dynamics of rural transformation in the state. The authors note that there has been some dynamism in the rural economy leading to the emergence of new economic classes in the public arena which has led to political turbulence as well. There has been a widening of the base of landownership on account of land reforms. Some backward and intermediate castes as well as some scheduled castes were able to become landowners. The abolition of zamindari only led to large-scale eviction of tenants without significantly altering the dominance of the major proprietary castes, the brahmins, thakurs, jats and ashraf Muslims. Agricultural dynamism instilled by the Green Revolution, which initially was confined to the western region, has spread to other regions as well, thus closing the gaps in growth and productivity between regions. Employment in agriculture has in general been disappointing although there has been an increase in real wages, but non-agricultural employment has increased even if it often involves temporary migration. In spite of this dynamism at the macro level, the

traditional hierarchies at the village level are not significantly altered for each of the six villages have their own particular social specificities such as the dominance of jats or brahmins, etc.

The succeeding chapters focus on power relations first at the level of the three districts – Muzaffarnagar, Rae Bareilly and Jaunpur – and then in the six villages taken up for the study – Siswa, Nawa, Teka Janwa, Jasra, Birpur and Belapur. Patterns of caste-wise dominance in land and asset ownership, education and occupational diversification are presented for all the six villages based on data from household surveys conducted by the authors. The unmitigated jat dominance in Muzaffarnagar district is reflected in their dominance in the panchayats of the two villages, Siswa and Nawa. In Rae Bareilly's two villages, Jasra and Teka Janwa, the traditionally dominant castes have now to contend with the emerging landholding 'other backward castes' (OBC). This according to the poorer classes, has mitigated to a considerable extent the *dab-daba* of the traditional castes. In the Jaunpur panchayat of Birpur, brahmins and thakurs are still dominant, while the Belapur brahmins have in recent years put up spectacular shows of violence and dominance in their village. The authors thus contend that by and large the congruence of caste and class still holds good, with only some uneven disjunctures between the two. Dominance has to some extent been challenged by the poorer classes. Both the decline in traditional services performed by the poorer classes on account of Biradari solidarity and the increase in real wages on account of the Jawahar Rozgar Yojana (JRY) have increased the bargaining power of the poorer classes. Although the authors have taken up 76 pages of the book to explain the nature of rural dominance before launching on their discussion of panchayats, these chapters are useful in understanding the constraints in the functioning of panchayats.

After surveying 250 panchayat members from 25 panchayats before the new panchayat elections in 1995 and a few members of the new councils, the authors report that many candidates to the

panchayats before 1995 were elected unopposed signifying some kind of dominance relations, many panchayats only existed in name but were otherwise non-functional as meetings were hardly held, and the village pradhans had in most instances become dominant and villagers were very frightened to talk about them. In the new panchayats formed after 1995, OBCs and SCs have gained representation and many are agricultural labourers or poor peasants with low levels of literacy. Similarly, although there were many illiterate and poor pradhans in the new councils, they often tended to be pradhans by proxy, the rich landowners being the king-makers. Such proxies also abound in the case of women members and women pradhans. The new legislation of reservation for women and SCs was not viewed favourably by the richer classes. Intense factionalism in the villages created obstacles for the panchayats in undertaking even small development projects like road construction. The authors' general conclusion is that panchayats are not functioning properly and in many cases were not functioning at all. It is to the credit of the authors that they interviewed a large number of women.

The panchayats' role in the village development programmes was also evaluated. The selection of the beneficiaries for the IRDP programme by the village pradhan often resulted in the selection of ineligible beneficiaries as well as corruption. Since 1989 the JRY funds have devolved directly to the panchayats which despite a poor record on the employment front has pushed up wages. Despite this record, villagers overwhelmingly supported greater devolution of resources to the village panchayats with the caveat that there be better supervision over the management of funds. The study also did an insightful exercise of prioritising development expectations of the different classes. Across the board, everyone wanted a more responsive administration; the poorer classes favoured land reforms and redistribution of assets.

The overall conclusion of the book is that whatever be the deficiencies of the panchayat system, it has opened up expectations of a more broad-based participatory democracy, and since these expectations cannot be rolled back, there is ground for optimism in the future. Combining anthropological and economic methods of inquiry, the authors have provided a serious study of an important aspect of the democratisation process.

Sense on Pokhran II

Vijay Prashad

Riding the Nuclear Tiger by N Ram; LeftWord Books, New Delhi, 1999; pp viii + 120, Rs 175 (hardcover), Rs 60 (paperback).

MOST commentaries on the Indian and Pakistan nuclear 'tests' remain at the level of the superficial, as we read reports of 'popular support' and of the machinations of the various international regimes vis-a-vis the two states. Only a few commentators have offered us balanced and reasoned analyses of these events, one of whom is N Ram (whose *Frontline* carried splendid technical and political pieces). Under review is Ram's book, *Riding the Nuclear Tiger*, written in conjuncture, as he notes, with the physicist T Jayaram. The book is without parallel as a summary account of the perils of 'atomic diplomacy' Indo-Pak style. In this review, I will examine some of Ram's main points, but I will also amplify them with the experience of Kargil (since I read Ram's book with those events in the background).

It does not take Ram long to cast away the infamy of 'deterrence'. Drawing from a host of wonderful material, Ram cuts at deterrence from two angles. First, he shows that 'deterrence' itself is both a logical fallacy and a historical failure. On the latter count, the nuclear powers did not feel deterred by the policy of Mutually Assured Destruction (MAD). On the contrary, many of these states pursued adventurist interventions across the globe at the expense of each other (hence, Kargil). Second, for the subcontinent, both India and Pakistan lack an acceptable early warning system to offer each other the comfort of deterrence. Rather than take shelter in the hope of MAD, each side will, if nuclear weapons enter the arsenal, await a 'first-strike' from the other. Any error in the instruments may result in an accidental, but no less deadly, release of nuclear missiles. In the event of a nuclear exchange, "neither Pakistan or India will be spared the effects of the fall out of radioactive material" (p 30). Given the lack of confidence between the two states, and given Pakistan's inferiority in conventional weapons, there is every indication that a nuclear strike might occur. "If there is a grave crisis with the possibility of nuclear confrontation", Ram notes, "the temptation to move towards a first-strike posture will be overwhelming if nuclear weapons are already deployed. Armies in the real world plan for the use – not the non-use – of their weapons" (p 82). This is what perhaps prevented the Indian army from opening a second front in Rajasthan during the Kargil conflict.

The anti-communist edge to atomic diplomacy was on display in the days after

Pokhran II when the BJP-led government targeted China as the threat to India. Ram quotes from Aijaz Ahmed who noted perceptively that "this focus on China is deliberate, as the beginning of a methodical red-baiting offensive within the country, as the inauguration of an arms race on the Asian continent, and as an appeal to long-term US goals in Asia" (p 6). As Ram asserts, "the appeasement policies followed by the BJP-led government after the nuclear explosions have enabled the enforcers of the Washington Consensus, led by the US, to tighten their grip over India's economic and political policies in a manner that could not have been foreseen in, say, early 1998" (p 10).

The attempt to appease the US led India to forgo a rather useful history of anti-nuclear activism. Indeed, Ram argues that "with their nuclear misadventure, the government of the Hindu Right and the strategic affairs apologists have attempted to lay a rich 50-year legacy to waste, and in doing so have alienated people of goodwill everywhere" (p 8). The 'swadeshi' decision to demonstrate 'shakti' was followed without much ado with the 'videshi-backed' acceptance of the protocols of the CTBT. India, until recently, refused to sign any treaties that perpetuated the discriminatory nuclear bargain. 'Todeal with 'nuclear apartheid', the Indian government from 1945 until 1998 "worked out for its own guidance clear rules for the game that kept the independent element and the peaceful development element in balance and thus stood the country in good stead". This included India's refusal to allow "full-scope safeguards" or for external surveillance of its peaceful nuclear programme (p 50). To sign the CTBT now, as the BJP seems wont to do, shows both "the subversion of a well-tested policy committed to independence as well as peace" as well as "exaggerated claims" about the capacity of India to be a nuclear power (p 74). C N R Rao argues that Pokhran II exemplified "trivial science" (p 60) – little that was learnt there will help produce a modern, nuclear armory. Drawing from this sort of comment (and from extensive work by T Jayaram), Ram points out that "India's current nuclear status is probably best described as 'pseudo-weaponised' and it is extremely unlikely that its 'nuclear deterrent' will become 'credible' in any global sense in the foreseeable future" (p 76). This is an argument that one has not heard anywhere else, and it is unique both to this book and

to T Jayaram's columns in *Frontline*.

What should the Left do in response to 'atomic diplomacy'? Ram argues that "from a democratic and progressive standpoint, the pursuit of independence on the nuclear question needs to go hand in hand with the non-hawkishness, self-restraint, and a genuine commitment to the global de-legitimisation and elimination of nuclear weapons". As he rightly points out, this stands diametrically opposed to the Jaswant Singh-Arun Shourie line that calls for one set of rules for nuclear powers and another for those without nuclear bombs (p 52). Ram's position also stands some way apart from those who draw upon Edward Thompson to call for a unilateral abandonment of the nuclear option. In the face of imperialist pressure, states like India must neither elect the nuclear bomb nor should they compromise their sovereignty by signing a discriminatory nuclear bargain. It is far better to stand apart from the hypocrisy of the NPT-CTBT and to fight for a genuine disarmament regime.

"After our nuclear tests", said General Pervez Musharraf (chief of army staff, Pakistan), "Pakistan is talking to India on an equal basis. We are not talking to India from a weak position" (p 62). Before Pokhran II, India held a large conventional weapons advantage over Pakistan. With Chagai, the imbalance was rendered useless, since Pakistan could now threaten to use the ultimate weapon if it was put into a conventional bind. In order to make Kashmir an international issue, Sharif and his Generals indulged in an adventure that would horrify the world with the prospect of nuclear war and therefore draw the 'international community' into deliberations over Kashmir. Indeed, as Sharif and Vajpayee prepared to meet in late July 1998 "a Pakistani barrage of bombardments, begun in early July, peaked and the targets shifted inwards, hitting positions as far away as 20 km from the LoC". With the high casualties as a backdrop, Pakistan came to the SAARC meetings to ask that India and Pakistan discuss nothing else but Kashmir. 'Bus Diplomacy' and the Lahore Declaration provided little confidence measures for the two sides. As Ram notes, "those who read into Vajpayee's pacifist rhetoric at Lahore the message that the bellicosity of the Hindu Right on relations with Pakistan is behind us are living in a world of maya" (p 90). For instance, the Pakistani government, whatever its motives, did offer not to deploy nuclear weapons (as in Sartaj Aziz's November 1998 statement). Fernandes did not respond. "The leading share of responsibility for the failure of the Lahore exercise to achieve real progress towards resolving the India-Pakistan nuclear stand-off rests", Ram argues, "with the BJP-led government" (p 88).

INDIAN POLITICS AND THE 1998 ELECTION

Regionalism, Hindutva and State Politics

Edited by **RAMASHRAY ROY** and **PAUL WALLACE**

This is the first book to critically analyze the 1998 general election in terms of changes in the party system and in the bases of social support. Comprising dynamic analyses of new and emerging trends in Indian politics, this volume provides data on the 1998 election combined with a rich comparison with past elections right from 1957. The book emphasises the importance of regionalism in Indian politics and examines a large range of important electoral issues.

DEMOCRACY AND SOCIAL CHANGE IN INDIA

A Cross-Sectional Analysis of the National Electorate

SUBRATA K MITRA and **V B SINGH**

Despite widespread poverty and illiteracy and religious and linguistic heterogeneity, India continues to sustain a viable and fairly orderly democratic government. The resilience of Indian democracy in the face of these problems coupled with the challenges posed by modernisation and accelerated social change, is explained in this book with reference to the cultural, institutional and social context of India's competitive and free and fair electoral process. The authors substantiate their views by drawing on a nation wide survey conducted in 1996 in which over 10,000 Indian voters, representing a cross-section of the country's electorate, were interviewed.

DEMOCRACY WITHOUT ASSOCIATIONS

Transformation of the Party System and Social Cleavages in India

PRADEEP K CHHIBBER

The Indian party system, which had been dominated since 1947 by the catchall Congress Party, underwent a dramatic change during the 1996 and 1998 elections. For the first time, the Indian party system split along regional, caste and religious lines. In telling this story, Pradeep Chhibber adds a vital and neglected dimension to debates in comparative politics about state-society relations - namely, the nature of the party system.

CULTURE AND RATIONALITY

The Politics of Social Change in Post-colonial India

SUBRATA K MITRA

Using the post-colonial state as the backdrop, this important book addresses the theoretical issues of transformation in a multicultural and hierarchical society which is coping with the twin challenges of democratisation and development.

1999 • 440 pages • Rs 525 (cloth)

SOCIETY, STATE AND SECURITY

The Indian Experience

VERGHESE KOITHARA

Pre-publication comments on the book:

Koithara...has broadened the traditional meaning of 'security' to include a wide range of environmental, cultural, and economic issues which impinge directly on individual citizens.... Easily the best single volume available on India's complex security environment and the response of the Indian state to those threats.

Stephen P Cohen

[The book's] canvas is vast, its research astounding and its logic unbeatable.... It is meant to be read by every soldier, every bureaucrat and every politician.

Admiral (Retd.) J G Nadkarni

Electoral Politics in Indian States, 1989-99

Aditya Nigam
Yogendra Yadav

THIS special number brings together a collection of articles on electoral politics in India in the last decade. Most of the articles here focus on one state and take a close look at the trends and patterns in the series of parliamentary and state assembly elections since 1989. The authors examine the electoral outcome as revealed in the aggregate data by placing it in the context of the structural attributes of state politics. In addition to this, they also weave into their interpretation the available survey data from the various surveys carried out by the Centre for the Study of Developing Societies (CSDS). There are also some general articles that examine the process of electoral and political change at the national level in this period by focusing on a party (Congress and the BJP), a group (dalits) or a process (caste and politics). But such is the salience of the state level analysis in this period – characterised as the 'third electoral system' by Yogendra Yadav in his overview – that even those articles that do not focus on any state place state politics at the centre of their analytical frame.

Competitive politics in India has undergone a major change in the last two elections – a process that began around the turn of the decade. The transformations within it reveal a bewildering array of patterns and give the impression of a gigantic mess that one cannot possibly make sense of. The electoral developments in the states do point, as most articles presented here will show, to the emergence of certain bipolarities, either in the form of competition between two parties, or often between two competing alliances. But there the similarities – or the possibilities of a larger pattern – seem to end. Beyond this express level of 'commonness', we can see at play an extreme fluidity of electoral-political permutations and combinations.

A common theme that runs through most of these articles is how the old, received, but hitherto dormant identities get mobilised and inserted into the grids of the representational democratic process. D L Sheth draws our attention to the three processes that are transforming the insti-

tution of caste: de-ritualisation, classisation and politicisation. Several articles bring out how dormant social identities acquire a new salience in the context of electoral competition. They could be of the type in Assam where the endless unravelling of identity leads to one kind of fragmentation (and also subsequent 'normalisation'); or they could be the Gujarat type of conflicts where the Hazooria-Khajooria divide within the BJP reveals eruption of social conflicts inside the very instruments/parties that were meant to externalise them. Social conflicts could, on the other hand, take a more explicit form as they do in the politics of Bihar. But even there, we could have the painful forging of a 'bahujan' or 'shudra' identity go through endless negotiations – often excessively influenced by conflicts between regions like the east and the west in UP or between the yadavs and the kurnis and koeris in Bihar. The unravelling of the old OBC bloc that has been going on for some time now seems to have reached its culmination. Recent developments have further accentuated this process with the remainder of the JD going to the NDA. Recent developments in Karnataka present another instance of this process. The divergences in voting behaviour between the assembly and the parliamentary elections which formed a kind of stable pattern in the past have been unsettled.

Equally importantly, it seems no longer possible to think of even 'national parties' like the Congress as homogeneous entities. In their study Anthony Heath and Yogendra Yadav show that the Congress represents different social forces in different states, depending upon whom it is facing as the main opponent. Oliver Heath examines the relationship between the BJP's entry into new regions and alliance building on the one hand and the broadening of its social base on the other. Both these articles demonstrate that the 'national' and 'regional' parties are not all that different from one another – the profiles of the former are also subject to continuous remaking through the mobilisational successes of the latter.

These and other articles that follow are exploratory in nature. Far from providing a definitive answer or a collective theory, they are aimed at raising some questions and preparing the ground for more nuanced and rigorous studies of democratic politics. These explorations are anchored in the desire to escape the two extremes of the discipline of political science – mindless empiricism on the one hand and impressionistic theorisation on the other. For the last two decades studies of Indian politics have suffered from a lack of reliable information base. The authors of the papers in this issue are part of an ongoing collective effort at gathering data on politics through large-scale surveys of the electorate. They along with some others form a network of scholars working in association with Lokniti: Institute for Comparative Democracy, a research programme of the CSDS. This network came into being through participation in the research projects National Election Study 1996 (NES 1996) and National Election Study 1998 (NES 1998). These studies build upon the legacy of National Election Studies of 1967 and 1971. They are empirically grounded yet theoretically sensitive studies of Indian politics which attempt to go beyond the mere numbers of electoral politics to try and understand the larger forces and long-term changes taking place in Indian politics and society. The studies presented here provide a first cut analysis of the data thus obtained.

NES 1996 and NES 1998 include five waves of all-India surveys of a nationally representative sample of the electorate, conducted before and after the Lok Sabha elections in those years. A target sample of 15,030 was approached and face-to-face interviews were conducted with 9,697, 9,266 and 9,833 respondents in the pre-, mid- and post-poll surveys respectively in 1996. The same panel was continued for the study in 1998 with some additions for new voters and actual interviews were conducted with 8,938 and 8,133 respondents in the pre- and post-poll surveys, respectively. The sample was spread across 20 states and union

territories, 108 Lok Sabha constituencies (one-fifth from each state), 216 Vidhan Sabha constituencies (two each from the sampled Lok Sabha constituencies) and 432 polling booth areas (two each from the sampled Vidhan Sabha constituencies). The Lok Sabha and Vidhan Sabha constituencies were selected by circular sampling (probability proportionate to size) and the polling booths by simple circular sampling. Each state was allotted a sample size in proportion to its share in the national electorate. Within a polling booth area the respondents were selected from the electoral register by circular sampling with a random start. An analysis of the sample profile convinces us that the NES series meets its goal of achieving a nationally representative sample that can stand rigorous scrutiny. We believe that this ongoing series should prove a valuable source of data for anyone working on democratic politics and social change in India.

[We would like to acknowledge the editorial help of Aditya Nigam, honorary associate fellow of Lokniti, CSDS, in

putting together these papers for publication. Earlier versions of most of these papers were presented at the two national workshops for state co-ordinators involved in NES 1996 held at the Department of Political Science, Utkal University, Bhubaneswar in November 1996 and at the CSDS, Delhi in December 1997. Thanks are due to Mrs Kanehan Malhotra, Himanshu Bhattacharya and K A Q A Hilal of the CSDS Data Unit for providing survey data analysis and aggregate election data for these articles and to Bhuvan Chandra for word processing.

The financial support of Indian Council of Social Science Research and *The Hindu* for NES 1996 and *India Today/TV Today* for NES 1998 is gratefully acknowledged.

At the national level the new NES series has been co-ordinated by V B Singh (principal co-ordinator) and Yogendra Yadav (national co-ordinator 1996) and Sanjay Kumar (national co-ordinator 1998), all from the CSDS. At the state level, the surveys have been co-ordinated by Prakash Sarangi (Andhra Pradesh

1996), K Srinivasulu (Andhra Pradesh 1998), Apurba K Baruah (Assam and the north-east), Sanjay Kumar (Bihar and Delhi 1996), Rajendra Ravi (Bihar 1998), Anupama Singh (Delhi and Uttar Pradesh west 1998), Peter R deSouza (Goa), P M Patel (Gujarat), T R Sharma (Punjab, Himachal Pradesh and Haryana 1996), Sudhir Hilsayan (Haryana 1998), Sandeep Shastri (Karnataka), G Gopa Kumar (Kerala), Ram Shankar (Madhya Pradesh), Suhas Palshikar (Maharashtra), S N Misra (Orissa 1996), Bijoy K Bohidar (Orissa 1998), S N Singh (Rajasthan 1996), Sanjay Lodha (Rajasthan 1998), G Koteswara Prasad (Tamil Nadu and Pondicherry), V K Rai (Uttar Pradesh east), M Aslam (Uttar Pradesh central 1996), M S Mishra (Uttar Pradesh central 1998), Pradeep Kumar (Uttar Pradesh west 1996 and Uttar Pradesh north 1998), Sajal Basu (West Bengal 1996) and Surojit Mukhopadhyaya (West Bengal 1998).

Finally, our gratitude to the team of investigators for doing fieldwork under trying circumstances and to all the respondents for their time and patience.]

Electoral Politics in the Time of Change

India's Third Electoral System, 1989-99

Yogendra Yadav

The popular reading of the last decade of electoral politics is of a rapid decline and impending collapse of Indian democracy. This essay attempts to contest this all too familiar view from above without yielding to the temptation of building its mirror-image. The changing outcome of the electoral game in this decade is seen here as the reflection of a fundamental transformation in the terrain of politics which in turn is anchored in the process of social change. The voters choose differently in this decade, for, the structure of choice inherent in elections has undergone a change. Yet the choice often turns out to be far from the act of sovereignty that the fiction of liberal democracy makes it out to be.

AN attempt to understand the politics of electoral choice in contemporary India brings us face to face with a tension that lies at the heart of India's current democratic transition, if not at the heart of democratic theory itself. The current decade represents the full unfolding of the contradiction between the logic of political equality and that of social inequality, something that Ambedkar had warned against in the Constitution assembly itself. The dynamics of political equality triggered off by the institution of universal adult franchise and the self-reproductive processes of the structure of socio-economic inequality inherited from the past have both crossed a certain threshold without being able to tame the other completely.

As the participatory upsurge leads to the downward spread of democracy, the political processes begin to disturb the inherited ritual social hierarchy and trouble the established elite with hitherto unknown anxieties. Since elections are associated with much of this upheaval, the spectacle of election has come to occupy an aura of 'samudra manthan', the grand ritual churning of the social sea by the small gods of democracy with the help of the modern instrument of a vote. But just as this churning seems poised to yield the proverbial 'amrita', it comes up against the rocky bed of economic inequality. The maya of collective action and the invisible 'rakshasa' called Ideology conspire against all the small gods. The churning does not stop, the spectacle goes on. Yet at some level it turns into a harmless game, subtly delinked from some of the gravest threats it posed to the lords who inherited the sea.

It is hardly surprising that the enactment of this story through a series of elections, all in the course of 10 years or so, has stumped analysts of Indian politics, often deceiving them into a surface reading of the entire process as no more than a horse-race of political entrepreneurs.

Interpreting modern politics is a demanding activity in the best of times. But the cognitive demands placed on the interpreter of contemporary Indian politics appear excessive even by that standard. For one thing, the received conceptual frames of various hues were never designed to grasp the specificity of the path of democracy in a poor, non-western society. Besides, there was no way the feeble intellectual attention given to the task of collecting relevant information and making sense of it in India could have met the scale and the pace of events in the last decade.

The most common reading of the last decade of electoral politics, in its academic and popular versions, is a story of the rapid decline and the impending collapse of Indian democracy. It finds signs of widespread election fatigue leading to popular disinterest in and cynicism towards politics. The last decade stands out for sudden outburst of some of the maladies inherent in our system: the endemic multiplication in the number of political parties and the fractionalisation of the political space; the rise of regional parties and caste-community based parties that threaten to unleash fissiparous tendencies and a clash of primordial loyalties; end of ideology-based politics and the decline of political morality; and, of course, excessive political corruption, non-governance, disorder and instability. To sum up: our politics is one big mess.

The principle ambition of this overview of the electoral politics of the last decade is to contest this all too familiar view from above without yielding to the temptation of building its mirror-image. The changing outcome of the electoral game in this decade is seen here as the reflection of a fundamental transformation in the terrain of politics which in turn is anchored in the process of social change. The voters choose differently in this decade, for the structure of choice inherent in elections has under-

gone a change. The size, the composition and the self-definition of those who choose have changed. More and more citizen from the lower rungs of society participate in this ritual of choosing, they come not as individual but as groups, and they bring with them their own tastes and worldviews. They have much more to choose from and they exercise their right to reject very frequently, as the site of choice has moved closer home. Yet the choice turns out to be far from the act of sovereignty that the fiction of liberal democracy makes it out to be. The voters can choose from a given set, but they cannot determine which set to choose from. They can elect someone and then throw himself out, but there is precious little that they can do to ensure that the representatives actually represent them once in power.

THIRD ELECTORAL SYSTEM

The period since 1989 is best characterised as a new electoral system, the third one since the inauguration of democratic elections in 1952. Normally the expression 'electoral system' is used in the limited sense of the formal rules that specify the procedure (first-past-the-post or the proportional system, for example) followed in elections. In that sense there has been no change in our electoral system. But political historians have also used the same expression to capture a certain constellation or pattern of the outcome and the determinants of electoral choice that characterise a certain period of history.¹ In this substantive political sense, we can talk of a new electoral system when we detect a destabilisation of and its replacement by a new pattern of electoral outcomes as well as its determinants.

In this substantive sense the first four general elections from 1952 to 1967 fall under the first election system. The one party dominance of the Congress meant that the elections in this period were not seriously competitive in this period marked

by a low level of electoral participation. The choice was between the omnipresent Congress and its regionally fragmented opposition; often the opposition came from within the Congress. Electoral loyalties were fixed at the national level unless the constituency level preferences dictated short-term deviations from it. The voter of course did not vote as an individual, but rather as a member of politicised 'jati'. Next to the candidates' party, their jati had some effect on the voting behaviour. In social terms the castes that enjoyed the benefits of early entry into modern education or early politicisation through the national movement or both dominated the list of elected representatives. The 1967 election had already signalled a transition, for the monopoly of the Congress and the savarna jatis was challenged for the first time in north India. The process had started much earlier in the south.

Although Indira Gandhi's unprecedented electoral victory in the 1971 election was initially seen as the restoration of the Congress dominance, in retrospect that election looks like a beginning of the second electoral system. The apparent continuity of the Congress was deceptive; the Congress that Indira Gandhi led to power in 1971 was a new party that had to negotiate a new terrain of electoral politics. The move towards the new system was triggered off by the first democratic upsurge in the late 1960s. The upsurge brought a great many new entrants from the 'middle' castes or the OBCs into the game of electoral politics and turned it truly competitive. Congress was no longer the single dominant party but throughout the 1970s and 1980s it continued to the natural party of governance, the pole around which electoral competition was organised. The success or the failure of the attempts by the 'opposition' to put up a united front against the Congress made a decisive difference to the electoral outcome. Elections turned into plebiscites where the effective unit of political choice was the entire nation, sometimes split along the north-south lines. A typical electoral verdict in this period took the form of a nation-wide or sometimes state-wide wave for or against the Congress. The local specificities of a constituency simply did not matter. These electoral waves flattened the terrain of electoral competition, leaving little room for local variations. In social terms it was a period of cross-sectional mobilisation via state-wide jati alliances like KHAM in Gujarat or AJGAR in Uttar Pradesh. Ideologically, it was an era of populism, as the borrowed framework of western

ideologies was adapted to suit popular taste.²

On the face of it, the 1989 electoral verdict appeared no different from the earlier wave elections of the second electoral system. In many ways that election indeed belonged to the earlier period. The rise of V P Singh had galvanised the opposition to the Congress. The anti-Congress wave in north India followed the same logic of opposition unity (captured so well by David Butler and Pranoy Roy's index of opposition unity) as the 1977 wave. The Congress and the opposition tried their old social alliances. Yet there were signs of the new order yet to be born. Under the umbrella of Janata Dal, state-wide political formations had already begun to exercise a significant role in national politics. Devi Lal and Biju Patnaik were already major political players. The election result also carried signs of shifting social basis of politics: Muslims in UP and dalits and OBCs in Bihar had already begun to upset the given social equations for political parties. In that sense the 1989 election lies at the cusp of the second and the third electoral system.

The decisive stimulus for change came between the 1989 and the 1991 in what was christened as the three Ms of Indian

politics: Mandal, Mandir and Market. The almost simultaneous and sudden occurrence of these three events – the implementation of the Mandal Commission's recommendations for OBC reservations, the BJP's rathayatra that catapulted the Babari masjid dispute into national prominence and the forex crisis leading to the implementation of the first phase of IMF sponsored package of 'liberalisation' – created an extraordinary opportunity for reworking the established political alignments. All the three offered the possibility of creating a new cleavage that cut across the established cleavage structure and thus engaging in a new kind of political mobilisation. Eventually, not all the three cleavages could be activated in politics, at least not in the same degree. But the simultaneity of this change did result in a transition of the electoral system and allowed several latent forces to surface in electoral politics.

The 1991 verdict finally inaugurated the new system. The earlier logic of regime alteration and that of Congress victory in the context of divided opposition clearly indicated a massive victory for the Congress in 1991, a repetition of the 1980 wave. But it did not happen. The Congress improved only marginally, not enough to

TABLE 1. VOTE SHARE OF MAJOR FORMATIONS IN LOK SABHA ELECTIONS, 1989-1998

	1989	1991	1996	1998
Congress	39.5	36.6	28.8	25.9

TABLE 2: NUMBER OF PARTIES: TOTAL AND EFFECTIVE AT NATIONAL, STATE AND CONSTITUENCY LEVEL, 1952-1998

Election year	52	57	62	67	71	77	80	84	89	91	96	98
Total no of parties in Lok Sabha	21	13	21	19	25	19	18	22	25	25	29	40
Effective No of parties [National]	4.1	3.5	4.2	4.7	4.4	3.4	4.2	3.9	4.7	5.1	6.9	6.9
Effective no of parties [average of all states]	3.1	3.4	3.4	3.6	3.0	3.5	3.2	3.0	2.5	3.0	2.7	3.0
Effective no of parties [average of all constituencies]	3.3	3.0	2.8	2.9	2.4	2.1	2.7	2.4	2.5	2.9	3.0	2.7

Note: All the calculation of the effective number of political parties in this table is based on the vote share of the parties in various Lok Sabha elections and uses the Taagepera and Shugart (1989) formula.

Source: Heath 1999: 66-71.

have a clear majority. But for the additional votes brought in by Rajiv Gandhi's assassination, it would have remained at the same level as in 1989. The BJP's success in UP, Gujarat and Karnataka defied all the established patterns of political sociology and political geography. The state parties did not look like a flash in the pan: they were here to stay. Clearly we were in a new political era. The near majority that Congress mustered allowed it to postpone the arrival of the by now familiar consequences for the new system by another five years. The full implications were to unfold in the 1996 and the 1998 Lok Sabha elections. But the outlines of the new system were clear in the series of assembly elections held between 1993 and 1995.³

Electoral outcomes in the subsequent elections have established beyond doubt that we now live in a different era. But there is no need to recount all the changes here. The rise and fall in the fortune of political parties and leaders in this period is too obvious to be missed out even by a casual spectator. What is required however is an account of what has changed, not by way of events and personalities but with reference to the processes and structures that bind the day-to-day routine of the electoral race. For an obsession with the rapidly swinging fortunes in the political games can turn our attention away from the silent yet fundamental changes in the ground rules of this game. Also, we need to ask whether these fundamental changes have resulted in a meaningful realisation of the promise of electoral democracy, the promise of self-governance.

POST CONGRESS POLITY

The most obvious and easily identified characteristic of the third electoral system is the change in the choice set available to the voter. Table 1 summarises the changes in the vote share for the major political formations since 1989. A continuous decline in the vote share for the Congress in every election stands out as the defining feature of this distribution of vote shares. Clearly the changes are so basic that we are justified in talking of a new party system. In the first two systems under the Congress era the voter exercised only one choice, whether to vote for or against the Congress. That is no longer the case, and not just because there are many non-Congress alternatives. Congress is no longer the pole against which every political formation is defined. In this sense we are in a post-Congress polity now. Even in those states where there is a direct race between the Congress and its rival,

the Congress is no longer the natural party of governance. In fact there is good evidence (see Heath and Yadav in this issue) that the Congress vote in the 1990s is defined by its opponent. Congress picks up residual votes after its opponents have targeted and mobilised a certain section. The vote for the Left Front in West Bengal and Kerala had long ceased to be merely an anti-Congress vote; it is more meaningful to see the Congress vote in West Bengal as anti-Left Front vote. In Delhi, Rajasthan and Gujarat the Congress has been replaced by the BJP as the natural party of governance. In Bihar, UP and Tamil Nadu any talk of Congress/anti-Congress vote is bound to invite ridicule today. Unlike the BJP, the Congress is yet to accept the imperatives of coalition politics and alliance building. The way three of its strong units (Maharashtra, West Bengal and Tamil Nadu) broke away from the parent party and does not augur well for the future of the party. The Congress is there to stay but the Congress era in politics is behind us.

The rise of the BJP to power and a consistent rise in its vote share with every election since 1984 has been accompanied by a three-dimensional expansion in the 1990s (Olliver Heath in this issue). In geographic terms it has expanded much beyond its north Indian, Hindi heartland core to include Gujarat and Maharashtra in its core areas. More importantly it has developed substantial presence in Karnataka, Andhra Pradesh, Orissa and Bihar and a foothold in West Bengal and Tamil Nadu. In social terms it is no longer an urban bania-brahmin party. It has developed a formidable rural base, extending well into the lower OBCs and

some adivasis. The BJP and its allies were the highest vote getter not only among the upper class Hindus but also among the OBCs as a bloc. In political-ideological terms, the party has expanded to win the confidence of various allies who have little patience with its Hindutva ideology. In this respect the formation of the National Democratic Alliance, the alliance with DMK and PMK in Tamil Nadu and with splinter JD in Bihar and Karnataka on the eve of 1999 elections symbolises the extent to which the BJP has been able to erase its status of a political untouchable in the aftermath of the demolition of the Babari masjid.

The third space – the alternative outside the Congress and the BJP fold – has seen major ups and downs in this period. Yet some developments are here to stay. The rise of the BSP as a recognised national party deserves more notice than it has received. After all, it is the first truly new party – whose genealogy cannot be traced back to the parties at the time of independence – that has managed to cross the high threshold of viability under our first-past-the-post system. Most other new entrants have managed to cross the threshold only at the state level. In this context the rise of state parties has changed the nature of political alternatives. Parties like the Samajwadi Party, Samata Party, Rashtriya Janata Dal, Nationalist Congress Party and arguably Mamata's Trinamool Congress or the TMC in Tamil Nadu are not cast in the same mould as the classical regional parties like the Akalis or the DMK or the TDP. Their political presence is state specific but their political vision is not. Each of these would go out of their way to claim that they are a national party.

TABLE 3: AGGREGATE VOLATILITY BETWEEN LOK SABHA ELECTIONS, 1977-1998

(Per cent)

Election years	1977-1980	1980-1984	1984-1989	1989-1991	1991-1996	1996-1998
Aggregate volatility	23.8	21.5	16.1	11.8	12.9	14.7

Notes: Aggregate volatility is calculated by measuring the 'swing' between a party's vote share between two elections. The value reported in the table is the sum of the swing for all the parties divided by two. Where new parties have emerged, or split, the entire vote share of the new party is taken as the swing. In this calculation only parties that gained either at least one seat or at least 1% of the national vote are included in the swing calculations. Independents have been excluded. Only parties that gained either at least one seat or at least 1 per cent of the national vote are included in the swing calculations. Independents have been excluded.

TABLE 4: TOTAL SEATS RETENTION BETWEEN LOK SABHA ELECTIONS, 1977-98

	1980	1984	1989	1991	1996	1998
Seat	154	338	200	301	264	263
Per cent	28	62	37	55	49	48

Notes: The table reports the number and percentage of the seats retained by all the parties in any Lok Sabha election

Source: CSDS Data Unit.

In some sense the Left parties belong to the same category. They are the only formation not to have undergone a basic change in its geographical or regional profile in the last decade, though have lost some votes, are more confined to their regional pockets and are a little more lower class- and caste-based than before. The third space has emerged in this decade as the spring of political alternatives. While its failure to consolidate into an all-India third formation has greatly reduced its say in national politics, this failure has also kept open a diversity of political choices within the mainstream of national politics.

POLITICAL FRAGMENTATION?

If the electoral choices available to the voter are to be judged by the number of political parties that seriously contest the elections and can put up viable candidates, there is some expansion of the choices available in the third electoral system. The number of political parties that have gained entry to the Lok Sabha has gone up dramatically in the last Lok Sabha. This does not indicate their real strength. There is little evidence to support the popular belief that this figure reflects a fragmentation of the party system or a mad proliferation of parties. Yet if we calculate the number of parties by their effective share of votes or seats, we find a marginal increase. But that is a function of artificial aggregation at the national level. If we look at the number of effective parties at the state level or at the constituency level, we find basically a bipolar competition. Duverger's law that postulates the emergence of two-party system in a first-past-the-post electoral procedure does work in India too, except that it works at the state level. Instead of producing a simple bipolarity at the national level, it has resulted into 'multiple bipolarities' (Sridharan *nd*). It does indicate an expansion in choice, but not of the kind suggested by the first impression of the national figure of the number of political parties.

Notwithstanding the new entrants, our system continues to maintain high barriers for newcomers, especially for those that operate at the level below that of a state. In practice all the peoples movements that stand for attempts to build political alternative operate at a local level and find it impossible to cross the minimum threshold of viability. The last decade has seen various experiments by the erstwhile non-party political formations to register their presence in the electoral arena: Chhattisgarh Mukti Morcha, Karnataka Rajya Rayyata Sangha, UTJAS in north Bengal, Samata Sangathan in Orissa and Bihar, Bahujan

Mahasangha in Maharashtra, to name a few. The eventual outcome has either been a complete failure (even in those areas where these movements and their leaders have for a long time enjoyed mass support) or a gradual absorption after initial success. Clearly the present system has little room for micro political action to translate into effective political alternative. The failure of any third force to develop downward linkages with grassroots movements and upward linkages with each other in a national framework largely accounts for an the absence of genuine and effective political alternative in the Third Electoral System.

Does the voter use the vote more effectively? If electoral volatility is any measure of the effective use of vote in mass elections, a simple look at the data may suggest that the voters are less decisive now than they were before. The era of wave elections witnessed massive swings between two elections. The 1990s have not witnessed anything like that. Table 3 quantifies this impression and shows that if we sum up all the swings for various parties, there has been a decline in it in the 1990s. The last three elections have not seen anything of the kind of swing witnessed in the previous three elections. The figures for the last two elections would have been lower than the table depicts, if the artificial effect of the formation of new parties or party splits was taken out of the calculation.

But as in many other cases, the aggregate figures conceal more than they reveal. As Tables 4, 5 and 6 show quite conclusively, the elections of the 1990s have seen a very high degree of volatility. Table 4 shows that although the overall

composition of Lok Sabha has not changed very much, an extraordinary proportion of seats have changed hands between two elections. In the last two elections more than half of the seats have changed hands, a very high figure by any standard. Table 5 confirms this impression by examining the 'hard core' evidence of survey panel. It shows that all the parties, including those in ascendancy lose anything between 35 to 50 percent of their voters across two elections, another unusually high figure. A third way to examine the volatility is to look at how the incumbent governments fared in the various assembly elections since 1989. Table 6 shows that the failure rate of the incumbent governments at the hustings is as high as 77 per cent. The figure touches 82 per cent if we look exclude the small states and Uts where competitive politics is sometimes yet to take off. In other words, barring a few exceptions, all the state governments have faced defeat at the polls in this period. And those who did not were governments that did perform in one respect or the other.

Clearly, whatever the choice set available to the voters, the election outcome of the last decade indicates that they use it quite effectively and often in a very discerning manner.

The voters have also been effective in bringing about a noticeable change in the composition of the political elite. Politics of presence or representational democracy is the most immediate form of assertion by the newly enfranchised communities. To those already enfranchised, this is the time to go for the higher forms of political representation. To be sure this change is very uneven and holds mainly for numerically large and electorally

TABLE 5: VOTE RETENTION BY PARTIES/ALLIANCES BETWEEN LOK SABHA ELECTIONS, 1991-1998

	INC+	BJP+	NF/UF	LF	BSP
1991-96	53	65	53	68	56
1996-98	53	63	38	61	41

Note: Table entries refer to the percentage of those who voted for a party in the previous elections who continued to vote in the next one. The data includes only panel respondents. The data on 1991 is based on recall in 1996 pre-poll survey.

TABLE 6: INCUMBENT PARTY'S PERFORMANCE IN ASSEMBLY ELECTIONS, 1989-1999

	Total Number States No	Information Available on No	Incumbent Won		Incumbent Defeated	
			No	Per Cent	No	Per Cent
Major states	35	33	6	18	27	82
Minor states/UTs	28	24	7	29	17	71
All states	63	57	13	23	44	77

Note: Major states include all the states with 10 or more Lok Sabha seats. The rest, including Uts with elected assemblies are treated here as minor states/UT. Those cases where it was difficult to determine who was the incumbent or who really won the election have been excluded as No Information.

Source: CSDS Data Unit

decisive communities. As such the OBCs are the biggest gainer in the race for political parties to accommodate them in their organisational and legislative wings. There is no appreciable increase in the presence of women in the legislatures, nor have the Muslims gained much from it. Yet times of political turbulence, close electoral contests and frequent elections bring numerous gains to marginal groups. A large number of lower OBC castes have had their first MLA or the first MP in this decade. It is in this decade that India had two prime ministers from the south and the first dalit woman as the chief minister.

DEMOCRATIC UPSURGE

If there is so much turbulence at the level of electoral outcomes, one of the fundamental reason for it is that the participatory base of electoral democracy is expanding in the 1990s. Once again, aggregate figures can be deceptive here. The upsurge does not always show up in any dramatic jump in the overall turnout figures and that is why analysts have tended not to notice it. Table 7 presents these overall turnout figures. But now there is sufficient evidence to conclude that the electoral political arena in this period has witnessed greater participation and more intense politicisation than before.⁴ This tendency is particularly strong among the shudras, used here as a generic category for all the marginal social groups including women.⁵ The dominant peasant proprietor OBCs were already fairly politicised in the second system, but now there is an extension of this trend to the lower OBCs as well. Table 8 presents the odds ratio for voting for different caste, community or class groups. The odds that a dalit will vote are much higher today than that of an upper caste. This has been accompanied by a significant rise in their sense of efficacy and their involvement in more active forms of political participation. This is perhaps due to the fact that it was only in this decade that a sizeable chunk of dalit electors were able to actually exercise their voting right for the first time, especially in north India. The huge turnout gap between the adivasi and the non-adivasi voter has been bridged in the last three elections, though the adivasi citizen is yet to catch up in the active forms of political participation. Table 9 looks closely at the women's turnout to show that the proportion of women among the voters has gone up after stagnating for nearly two decades. Their proportion among the politically active citizen has also registered a major leap. Table 10 looks at the turnout for different constitu-

encies grouped by their degree of urbanity. We know that in the first two decade of electoral democracy, urban areas recorded higher turnout. Now the rural constituencies have overtaken the urban constituencies in electoral turnout.

As shudra participation has increased in the last ten years, the socially and the economically privileged sections of society have recorded decreasing levels of political participation. An urban, educated, upper caste citizen is far more likely to be non-participant and cynical about matters political than his counterpart among the rural, uneducated, lower caste. Even a cursory look at the participation profile in other democracies is enough to demonstrate that this trend is very unusual. The textbook rule about political participation is that the higher you are in social hierarchy, the greater the chance of your participating in politically activity including voting. Contemporary India is perhaps the only exception to this rule among functioning democracies in the world today. The participatory upsurge of the shudras is the defining characteristic of the Third Electoral System. The continuous influx of people increasingly from the lower orders of society in the arena of democratic contestation provides the setting, the stimuli and the limits to how the election system unfolds.

CREOLISATION OF DEMOCRACY

The influx of lower orders into the field of democratic contestation has left its impressions on the vocabulary of this contestation, for the new entrants brought with them their beliefs as well. For the first time the neat arrangement of the borrowed high ideological spectrum was disturbed by homespun ideological fragments. The

raw narratives of social justice articulated by a Kanshi Ram or a Laloo Prasad Yadav achieved what Lohia's sophisticated philosophy of history failed to do three decades ago, namely, to make it respectable to talk about caste in the public-political domain. The emergence of 'social justice' as a rubric to talk about caste equity, political representation of castes and communities and issues of communitarian self-respect and identity is a distinct achievement of this period.

Yet the participatory upsurge has not led to anything like an effective control of the lower orders on the issues or the agenda

TABLE 8: ODDS-RATIO FOR VOTING: 1971 AND 1996 AND 1998

	1971	1996	1998
<i>Community</i>			
Hindu Upper	1.11	0.90	0.97
Hindu OBC	0.82	1.07	0.94
SC	1.04	1.22	1.21
ST	0.65	0.91	0.95
Muslim	1.59	0.92	1.12
Sikh	1.53	0.86	1.60
Christian	2.29	1.13	1.05
<i>Economic status</i>			
Very Poor	0.89	1.24	0.92
Poor	0.98	1.13	1.05
Middle	1.14	0.94	1.18
Upper middle	1.06	0.89	0.96
Upper	1.38	0.75	0.75
<i>Education</i>			
Illiterate	0.82	1.03	0.91
Up to middle	1.49	1.01	1.33
College	1.29	1.05	0.91
Graduate	1.07	0.70	0.66

Notes: The variable for constructing the economic status of the respondents was derived from their type of occupation and amount of land owned, and in 1971 and 1996, family's monthly income and in 1998 the type accommodation.

TABLE 7: TURNOUT IN LOK SABHA AND MAJOR ASSEMBLY ELECTIONS, 1952-1998

Lok Sabha elections		Major State Assembly Elections		
Year	Turnout (Per Cent)	Year	No of States	Turnout (Per Cent)
1952	45.7	1952	22	46
1957	47.7	1957	13	48
1962	55.4	1960-62	15	58
1967	61.3	1967	20	61
1971	55.3	1971-72	21	60
1977	60.4	1977-78	24	59
1980	57.2	1979-80	16	54
1985	64.1	1984-85	18	58
1989	61.9	1989-90	18	60
1991	55.9	1991	-	-
1996	57.9	1993-96	25	67
1998	62.1	1998	4	63

Note: A 'major' round of assembly elections is defined here as one which involved, within a year or two, elections to at least 2000 assembly constituencies. The figures for the last column do not conform to this definition. Calculations include provisional figures for state assembly elections held in 1995, the report for which has still not been released by the Election Commission.

Source: CSDS Data Unit.

of elections. The very raw narratives that ensured the presence of social justice as a theme also allowed for the marginalisation and containment of this concern. The homespun ideological fragments of this period were based on very small visions that failed to develop linkages with other larger issues. A support for caste based reservations, for instance, did not translate into any concrete stance on the Babari masjid dispute or on liberalisation and globalisation. This failure was most marked in the realm of the economic policy which was effectively withdrawn from the menu available to the voter.

This was made possible in large measure by the bifurcation of the electorate into two circles of intelligibility.⁶ While the new entrants to democratic politics struggled to express their local concerns and interests in the alien vocabulary of liberal democracy, the elite marched further away for its rendezvous with the so called global village. This gave rise to two radically different languages of politics corresponding to the 'Bhasha'/English divide. The former, a language of democratic rights and social justice, was deployed to win elections while the latter, a language of macro-economic and bureaucratic management, guided the framing of policies. While one section had the consolation of winning the elections, the other could continue to rule. Just when the lower order had some access to political power, the most significant economic decisions were removed from the political agenda.

If one goes by the popular accounts, the rise of casteism and its grip over electoral politics is the distinctive attribute of the 1990s. But such an account suffers from serious flaws. For one thing, caste has been operating in electoral politics for as long as we know. Candidates' jati was a crucial factor in electoral success even in 1950s. Besides, the relationship between caste and politics is not just one way traffic. Politics has affected castes as much as caste affects politics. What is distinctive about the current phase is not the 'deadly' mix of these two or the vicious grip of caste over politics but rather the manner in which politics has come to shape caste identities.

In the first electoral system, the effective social bloc was a jati in its local setting. In the Second System, jati remained the primary bloc but the game of manufacturing electoral majorities led to the building of state-wide alliance of jatis. An extension of the same search for stable electoral majorities has led to the replacement of jati by state-wide jati clusters or

varna like jati groupings as the primary social bloc for political mobilisation. The emergence of upper caste or upper/lower OBC or dalit as more or less homogenous category in some north Indian states is a pointer in this direction. The same process can be seen at work in the emergence of numerically large castes by combining more than one traditional jatis: Kshatriyas in Gujarat, Maratha-Kunabi in Maharashtra, Ahirs in Bihar, Rajbanshis in Bengal or Bhandaris in Goa are but a few example of the shifting definition of the primary social unit itself. To be sure, this development cannot be dated back only to the last ten years. Many of these communities had started evolving much earlier. Nor does this new process work to the exclusion of the earlier model of jati alliances. Yet it captures something of the qualitative change in this respect.

Beyond this level of generality, there is very little that is common to all the states in terms of the patterns of social cleavages activated by politics. Not only are the specific combinations unique to each state due to its social demography, but the nature of cleavage itself varies from state to state. If Andhra and Rajasthan represent a con-

test between two catch-all parties, UP and Bihar show evidence of extreme jati/varna polarisation. If religious cleavage accounts for voting differentials in Kerala and Punjab, it is class in Delhi and Bengal. If the Congress is a party of the down-trodden when it faces the BJP in the north-west, it represents privileges where it confronts the Left Front. The BJP combines its upper caste votes with different social groups in different states. The erstwhile Janata Dal represented three radically different social groups in the three states where it mattered: cross-sectional support with accent on the upper castes in Orissa, dominant peasant proprietors in Karnataka and dalit-lower OBC in Bihar. Such a differentiation of the social cleavages is itself a new feature of the third electoral system. While it allows various marginal communities to have a say in the state politics, such a large variety has not allowed the building of a larger coalition of marginalised communities that might give them a role in the national politics.

Another common belief in this respect is that whatever the exact nature of the social cleavages, there is a tendency towards greater political polarisation along

TABLE 9: WOMEN'S TURNOUT AND WOMEN AS PROPORTION OF TOTAL VOTERS, LOK SABHA ELECTIONS, 1957-98

Year	Women (Per Cent Turnout)	Men (Per Cent Turnout)	Women (Per Cent of Total Voters)	Turnout Index	Odds Ratio
1957	38.8	55.7	38.3	0.81	0.50
1962	46.6	62.1	39.8	0.84	0.53
1967	49.0	61.0	42.0	0.88	0.62
1971	49.2	61.2	42.4	0.89	0.61
1977	54.9	65.4	43.6	0.91	0.65
1980	51.2	62.2	43.1	0.90	0.64
1984	59.3	68.4	44.5	0.93	0.67
1989	57.5	66.4	44.1	0.93	0.68
1991	50.5	60.7	42.9	0.88	0.66
1996	53.4	62.1	44.0	0.92	0.70
1998	61.0	65.9	46.9	0.98	0.81

Notes: (1) Column 4 shows the percentage of women as a proportion of the total turnout. (2) The turnout index controls for the uneven size of the male and female electorate by expressing the proportion of women in turnout relative to the proportion of women in the electorate. For example, in 1998 women accounted for 46.9 per cent of the total voters and 47.7 per cent of the total electorate. We can therefore express the proportion in turnout as a fraction of the proportion of the electorate. Thus, $46.9 / 47.7 = 0.98$. If women had accounted for 47.7 per cent of the total voters then their proportion in turnout would have been equivalent to their proportion amongst the electorate and the turnout index would have equalled 1. (3) The odds ratios measure the ratio between the odds of women voting and men voting.

TABLE 10: TURNOUT BY DEGREE OF URBANITY IN LOK SABHA ELECTIONS, 1977-1998

Locality (Per Cent Urban)	1977	1980	1984	1989	1991	1996	1998
Rural (up to 25 per cent)	60.3	56.7	64.1	62.6	56.6	58.7	63.0
Predominant Rural (26-50 per cent)	60.4	57.8	64.8	62.7	56.8	59.0	62.9
Urban (51 per cent and above)	62.1	57.9	62.9	60.0	50.4	53.4	56.7

Notes: Table entries are for average turnout (in per cent) for the three groups of Lok Sabha constituencies according to the estimated proportion of urban electorate. The estimates have been developed by comparing the 1991 Census figures for urban population with the electorate size in 1991 Lok Sabha elections.

Source: CSDS Data Unit.

those cleavages. Once again the available evidence does not support this belief.⁸ It is true that the rise of a party like the BJP that has skewed social base did increase the overall level of ethnic/social polarisation in the early 1990s. In a state like UP where the BJP faces two other skewed parties in the BSP and the SP, there is an unusually high level of polarisation of votes along caste/community lines for the last decade. But that is not true of the rest of the country. In fact the 1998 elections revealed a decline in the overall level of polarisation. And, whatever the result of the 1999 election, the polarisation is likely to be even lower this time.

The final feature, namely the emergence of state as the effective unit of electoral choice, does not follow from any of those mentioned above; in fact there is some case for arguing that the above mentioned features are a result of the last one. Electoral choice in the Lok Sabha elections in the 1950s and 1960s was hardly influenced by the boundaries of the state. Under the Second system, the state were a distant secondary consideration in the nation-wide plebiscites. Barring states like Kerala and West Bengal that had emerged as exceptions, it was the north-south distinction that made any difference to the electoral outcomes rather than state boundaries. Throughout the 1970s and 1980s people voted in the state assembly elections as if they were electing a prime minister. The 1990s have seen a radical shift in this respect. There is an unmistakable foregrounding of her state in the political horizon of an ordinary citizen. Political loyalties, opinions and even social identities are now chosen at the level of the state. Now people vote in the parliamentary elections as if they are choosing a state government. State specific electoral verdicts, the rise of state-wide parties and the emergence of state-wide jati/varna clusters as the effective categories of electoral mobilisation in the 1990s are all manifestations of this structural attribute.

The rise of state politics has been viewed with considerable suspicion by the English press as the beginning of political fragmentation if not balkanisation of India. Such a reading fails to note that this development is a function of an aggregative rather than disintegrative process at work in our polity. It is better interpreted as the first step on the Indian path towards the creation of a mass society through the mechanism of competitive politics. In a continental size polity like ours, it is precisely by articulating rather than suppressing the distinctiveness of states that

a context for massification is prepared. Far from setting the stage for further fragmentation or effective decentralization within these states, the rise of the states indicates a high degree of homogenisation within each of these states. Whatever the implications for national integration, it is fairly clear that its implications for Indian democracy are positive. The context of state politics brings political choice closer to the every-day political experience of the people and gives them an opportunity to evaluate the governance that affects them most. That still leaves out a nuanced constituency specific assessment by the voters, but arguably the micro-level anti-incumbency at work in the 90s takes care of that gap.

In the limited sense described above, the third electoral system represents a relative expansion of democratic choice for the voters as well as their efficacy. But if we raise these questions at a more fundamental level, we confront the limits of what may have been achieved. Does the increase in the number of political options represent a substantive expansion of choice? Or do we have more of the same, or perhaps more of less? This is not to reiterate the universal scepticism about the nature of choice in liberal democracies. In recent times the political space in India has shrunk markedly because the mainstream parties, mainly the Congress and the BJP, are more like each other in all the crucial policy matters. The entire political spectrum of mainstream political options offers a very small range of policy options. This problem becomes compounded if we add the difficulty of exercising whatever policy options may be available. Here again the reference is not merely to the gap between the promise and the reality of collective action in any situation. In contemporary India the chain that links peoples' needs to their felt desire to their articulated demand to its aggregation and finally to its translation into public policy is impossibly long and

notoriously weak. People often use elections effectively to choose their representative and the government but rarely can they use elections to choose policies about issues that matter most to them.

Notes

- 1 In the context of the US political history, see Paul Kleppner, *The Third Electoral System, 1853-1892: Parties, Voters and Political Cultures* (Chapel Hill: University of North Carolina Press, 1979). The case for taking seriously the US political history of the late 19th century for understanding contemporary India has been argued persuasively by Rohin Archer 'American Communalism and Indian Secularism: Religion and Politics in India and the West', *Economic and Political Weekly*, XXXIV (15), April 10, 1999.

- 3 For an overview of that round and a first sketch of the outlines of the new system see my 'Reconfiguration in Indian Politics: State Assembly Elections, 1993-95', *Economic and Political Weekly*, XXXI (2-3), January 13-20, 1996.
- 4 I have tried to look at a wide variety of evidence in my 'Second Democratic Upsurge: Patterns of Bahujan Participation in Electoral Politics in the 1990s' in the volume edited by Francine Frankel (Delhi: Oxford University Press, in press). The conclusions offered in this and the following para are taken from that paper.
- 5 I follow here the original meaning of the term 'shudra politics' by Lohia.
- 6 This expression is borrowed from Sudipta Kaviraj's analysis of the nationalist discourse. Several Subaltern Studies historians have made a similar point about the disjunction between elite ideologies and mass beliefs. Partha Chatterjee's remarks on the parallel between the peasant insurgencies in colonial India and electoral waves in post colonial times point in the direction of a sub field of research that is waiting to be developed.
- 7 D. L. Sheth's paper 'Secularisation of Caste' is to my mind the most comprehensive and nuanced recent statement on the vexed relationship between caste and politics.
- 8 Preliminary conclusions based on the joint ongoing research on the changing pattern of community and vote from 1962 to 1998 by me and Anthony Heath.

For the Attention of Subscribers and Subscription Agencies Outside India

It has come to our notice that a large number of subscriptions to the *EPW* from outside the country together with the subscription payments sent to supposed subscription agents in India have not been forwarded to us.

We wish to point out to subscribers and subscription agencies outside India that all foreign subscriptions, together with the appropriate remittances, must be forwarded to us and not to unauthorised third parties in India.

We take no responsibility whatsoever in respect of subscriptions not registered with us.

Caste, Region and Community in Uttar Pradesh

V K Rai

Notwithstanding the fact that the BJP has spread into all regions of the state, there are structural limitations to its emergence as a broad-based dominant party on the lines of the Congress Party earlier. For one, the SP and the BSP which are well-established parties with strong social bases can pose an effective challenge, and for another, the rigid caste polarisation will prevent the BJP from gaining the support of the dalits and the backwards.

SOCIAL scientists have become increasingly aware that political action does not take place in a vacuum; that geography, demography, social and economic conditions of a state profoundly influence the political attitudes of its people and its political processes. Today UP politics is a melting pot—passing through an endless period of crises, alignments and re-alignments. Yet, paradoxically, there is a kind of stability in this instability.

The historical development of the state has had a profound effect on the present political outlook of its people and largely accounts for its importance in the country's politics. A large part of its area was previously called 'Aryavarta'. According to the Hindus, this is the most sacred part of the country. It is in this state that one finds a large number of holy temples and sacred rivers mentioned in myths and legends since time immemorial. Historically, people have migrated in large numbers from other states, whose intermingling with the local populace has helped in broadening the outlook of its people. Frequent in-migrations, particularly following invasions and conquests from the north, have contributed to a high population density in the state. What is surprising is that, in spite of its density of population and relative poverty, there has not been much of an exodus from the state. This attachment to the soil has a somewhat reactionary side to it but on the whole, till very recently, it did not lead to any parochial feeling. While the people of Uttar Pradesh are extremely religious, and there is a large Muslim population here, it nevertheless remains a bastion of Hindu conservatism.

As it exists today, as a political entity, UP has no history. Till the British clubbed its various regions together, and it was reconstituted in independent India, UP was ruled in different fragments. The people of the state consider themselves as belonging to entities like Agra, Bundelkhand or Awadh; they have no history to bind them to a unit called UP. The identification with the state is practically absent. Thus, while people in the rest

of India can describe themselves as Bengalis, Punjabis, Marathis, etc, there is no provincial name for 'Up-ites'—the inhabitants of UP. The only other identity available to its people is Hindustani or Indian. Therefore, until very recently, a persons from UP either identified themselves with their narrow region or with the whole of India—not with any other intermediate provincial outlook.

Uttar Pradesh is among the largest states of the Indian Union, with an area of 2,94,411 sq km which gives it the fourth position among all the states in order of size. It has usually been divided into six geographical zones, viz, western UP, eastern UP, central UP, Rohilkhand, Bundelkhand and Uttarakhand, i.e, the hill districts. The hill districts, Bundelkhand and the eastern regions are comparatively backward and poor. The relative prosperity of the western region can be accounted for by the existence, for a long period, of a network of irrigation canals, a more invigorating climate, and of late, a faster pace of industrialisation. The regions differ from each other in their language/dialect and food habits but the difference is not abrupt or very sharp. Geo-political and cultural variations have not led to any vigorous regionalism in the politics of the state, except for an occasional feeling among political leaders of the western region, to detach their districts from the state to form a new one in the hope of securing greater power for themselves and perhaps, in anticipation of greater progress for their region. The areas of this region do not have any distinctive features from the point of view of religious or caste composition of their population.

The people of UP are largely rural, lower caste and illiterate. Out of a total population of 1,39,12,287, Hindus form 81.7 per cent (more than nine crore) and Muslims 17.3 per cent—the rest are Christians, Sikhs and other smaller communities. According to census figures, it has a proportionately smaller number of scheduled tribes (0.2 per cent) but the scheduled castes form 21 per cent of its population. Other backward castes and the

upper castes form the remainder of about 55-60 per cent, that is, the remaining non-SC Hindu and some of the Muslim population (who fall under the OBC categories). Its urban population is only 19.84 per cent, and with a density of 471 per sq km. It is the fifth most densely populated state of the country. As in the rest of India, the upper castes form a comparatively low percentage. They are concentrated mostly in the western region, which incidentally, is relatively more developed economically. For ages, the political and economic leadership was in the hands of the west, but of late lower or backward castes like the yadavas, kurmis and others, have been organising themselves, particularly in the eastern region, thus sharpening inter-caste social and political friction. This conflict between the upper and lower castes/classes not only reflects a shifting of the centre of gravity of political power to the lower classes but also implies a move from western to eastern UP. This shift introduces its own internal convulsions.

UP is a large state with at least six distinct regions, each as big as a state. Therefore its development process has been slow, much below the national growth. Due to their political and economic strength some regions of the state like west UP and Rohilkhand developed more than other regions, particularly in comparison to east UP and Uttarakhand. The condition of eastern region of UP in this regard was so bad that it could not get even the minimum of development grant since independence. It is economically backward, its per capita income of Rs 1,754 is much below the average of UP per capita income of Rs 1,899. It is industrially, much more backward in comparison to the west. Although it is known as agricultural-based region because the majority of people (84.5 per cent) depend on it, the state hardly gets electricity for more than 6-7 hours per day. The canals are in fewer in number and means of transport and communication and roads, etc, are in bad shape particularly in Ghazipur, Basti, Deoria, Azamgarh,

Jaunpur and even in Allahabad's rural areas. That's why this region shows its volatile and anti-establishment feeling during elections.

ELECTORAL POLITICS IN UP

Since independence, the Congress Party has been predominant in the country as well as in UP, which has always been either in power or, in later years, has been the largest opposition party in parliament. It has also always had a broader support base in most of the states of the Indian union than any other party. It was so popular that in the 1952 elections, in a house of 430, the Congress won 390 seats with a vote share of 47.9 per cent and other parties like Jan Sangh and Socialists got just 12 per cent and 6.5 per cent of the votes, respectively. In subsequent elections its popularity and the vote share graphs dipped gradually while that of the Jan Sangh increased. The socialists too improved their overall performance but soon split into two groups, i.e., the Praja Socialist Party (PSP) and the Samyukt Socialist Party (SSP) which caused them much damage. The Left movement too could not make a place for itself in UP as it did in West Bengal, Tripura, Kerala and Telengana. However, one positive impact of the Left-led peasant movements on the state was felt in the sphere of land reforms. The impact was first felt in the jaf-dominated areas of western UP and gradually, in the eastern parts of this big state. Meanwhile, after the defeat of the Congress in the 1967 elections, a non-Congress coalition formed a government, with Charan Singh as chief minister. However, two years later, in 1969 the Congress returned to power with 211 seats and 33.7 per cent votes, which was nearly 1.5 per cent more than what it had got in 1967.

In the 1969 elections, Charan Singh's Bharatiya Kranti Dal mopped up a sizeable chunk of the votes in the western region of Upper Doab, Lower Doab and Rohilkhand. In the eastern districts, the socialists seemed to have retained control over a section of the peasantry. This divide was overcome, to a certain extent, by the 1974 elections in the state when a bridge was built between the west and the east by Charan Singh with the ideological instrument of AJGAR (a political-electoral combination of ahirs, jats, gujjars and rajputs). Yadavas and other backward caste leaders joined hands with jats to form a formidable alliance under a reconstituted party, which was then re-named Bharatiya Lok Dal.

After Nehru's death and in the course of the grand succession struggle which followed between 1964 and 1972, Indira Gandhi emerged as the unchallenged leader

of the dominant Congress Party, which came to be called Congress(R) (R stood initially for 'requisitioned'—referring to a party meeting requisitioned by Indira Gandhi during the split—but later came to mean 'Ruling' Congress). After a second split in 1977, following an unsuccessful challenge to her leadership from Congressmen discontented with the effects of her leadership on the party during the emergency, Indira Gandhi's Congress became known as Congress (Indira). The adoption of the designation Congress also symbolised what had happened to the Congress organisation under Indira Gandhi's leadership. It had become, in effect, her personal party, dependent upon her populist, often demagogic, leadership rather than on the local party organisation to win elections or to run governments at the state levels. Gradually, the party came to be controlled by personal retainers of the Nehru family and by members of the immediate family including Sanjay Gandhi until his death in 1981. The extent to which a great national movement had become converted into a Nehru family patrimony was indicated by the immediate and unquestioning acceptance of Rajiv Gandhi as prime minister of the country and the leader of the Congress upon his mother's assassination in November 1984. The Congress continued, under his leadership, to be highly centralised with state and local leaderships fragmented, and the absence of any organisational vitality. The Congress, therefore, despite formally remaining a mass party, has become a party of 'cadres' with no ideology but devotion to a prominent popular leader at its head. The local level organisation is dominated by notables who are entrenched within the strong local structures of power—within their caste groups, in the remnants of old landed estates, or through control of educational institutions, co-operative societies and other governmental or private organisations. In a strange way, the party's support base has been much broader than that of its leadership individually. It has been supported by the elite, the land controlling castes at the top, on the one hand, and the lower castes, the poor and disadvantaged, including many minority groups, on the other. This was its real strength. Equally important was the diversity of the opposition which could eventually lead to its displacement from power, as in 1977. Many opposition parties were quite serious about building counter movements to challenge the Congress and several of them gradually developed strong support bases in different regions of the country, including UP.

All the leading parties of the non-Communist left, centre and the right, along

with some subsequent defectors from the Congress, joined forces during the 'JP movement' in 1974—an alliance which was nurtured during and towards the end of the emergency to form a new political formation called the Janata Party. The programme and policies of the Janata Party drew primarily from the agrarian platform and ideas of Charan Singh. It advocated the promotion of agriculture, a labour-intensive small-scale industry and protection of the interests of the peasantry, particularly those of the rich farmers. Similar ideas, along with an emphasis on decentralised planning, were contributed by the Socialist partners in the coalition. Structurally, the Janata Party never succeeded in becoming anything more than a loosely-knit coalition of ambitious political leaders and parties who attempted to retain their existing organisational and support bases and to expand them by clinging on to power. A struggle for pre-eminence developed within the central government, between Charan Singh and Morarji Desai, with the former seeking to displace the latter and become prime minister himself. In July 1979, the coalition collapsed, Charan Singh became prime minister for three weeks until his resignation following his inability to prove his majority and the subsequent declaration of fresh elections (in 1980) which led to the return of Indira Gandhi and the Congress to the power.

After the disintegration of the Janata coalition, the political parties which initially joined it either re-formed themselves with new names or disintegrated. The principal remnants of the original Janata coalition were the Lok Dal, already split into Lok Dal(A) and Lok Dal(B), the Janata Party led by a former Congressman of moderate socialist inclination Chandra-shekhar, and the Bharatiya Janata Party, which consisted primarily of former Jan Sangh leaders and members.

Therefore, if we look back at the decades of the 1970s and 1980s, we see the rise and fall of Congress, formation and disintegration of the Janata Party and the resurgence of the Hindu right whose main mobilisational plank was that the existence of the Babri masjid at Ayodhya is a monument of 'national shame'. Although it was the Congress under Vir Bahadur Singh which reopened the locks of the 'Ram temple' in the Babri masjid, it was the BJP which took political Hinduism to the streets in tandem with the Vishwa Hindu Parishad (VHP). The BJP organised several 'Ekta yatras', which helped it to broaden its base and expand from urban areas to the rural as these yatras passed through the rural areas and provided room for the symbolic politico-religious

participation of the rural folk. This mandir-masjid issue became the single-point programme for the BJP that enabled it to stir up discontent by fashioning a discourse of 'national insecurity' and 'national shame'.

During and immediately after the 1989 elections, which brought the Janata Dal government to power in UP, the BJP set up an informal alliance with Mulayam Singh Yadav's government. The Congress was the principal enemy. But when Mulayam Singh used strongarm methods to prevent the seige of Babri masjid, he himself became the focus of a BJP-directed 'Hindu discontent'. This tendency was further fuelled when V P Singh's Janata Dal government in Delhi accepted the Mandal Commission's recommendations. The BJP was quick to capitalise on upper caste Hindu feeling of outrage. So rapid were political developments in this period that in the 1991 elections the BJP, going it alone won 221 seats.

The performance of Kalyan Singh's BJP government had been marked, on the positive side, by an ordinance to disallow copying in examinations at the secondary level along with an anti-dacoity drive in western UP. Above all, it was marked by the demolition of the Babri masjid on December 6, 1992, despite assurances given by his government to the Supreme Court of India, that this would not happen. Strange as it may seem, however, popular anger seems to have been mostly directed against the Congress government at the centre for not anticipating the December 6 events and taking effective preventive measures. The dismissal of the government afterwards was seen as having come too late. The BJP, on the other hand, was able to take the credit for demolition. But in the event, it proved fruitless as the party could not even get a simple majority in the subsequent election of 1993. The story was repeated again in the Lok Sabha and assembly elections in 1996. The think-tanks and ideologues of the BJP were astounded to see the results because they were not only expecting a clear cut majority but much more. This result was considered a major setback for the party not only in terms of its inability to form the government but also because its vote bank has remained stagnant since the 1991 elections.

LOK SABHA AND ASSEMBLY ELECTIONS: SOME TRENDS

The 1991 Lok Sabha elections marked a watershed in Uttar Pradesh politics. For the first time since independence, the state showed a political preference that went against the party that finally came to power in New Delhi. In all preceding elections,

the prospective ruling party at the centre had led the electoral discourse and dictated the choice. These elections also marked the coming to the fore of caste and communal politics in the state. The mandir and masjid issues (or the politics of 'Mandal and kamandal', as it came to be popularly known) polarised the electorate on caste-communal lines and determined the voting pattern. More important, the non-BJP, non-Congress secular vote was divided between the SP-Janata Dal-Left and the BSP. Five years ago, the most important factor that had helped the BJP win 51 seats with 33 per cent of the popular vote, and emerge as the largest party, was the consolidation of upper caste Hindu votes belonging to the brahmin, kshatriya, bania and kayastha communities. This was supplemented by significant chunks of the backward caste votes from the kurmi and lodh rajput communities. The BJP had also attracted a section of the dalit vote. The caste configuration favouring the BJP remains largely unchanged as far as the upper castes are concerned. However, there has been a slight erosion in the kurmi as well as dalit vote, though not statistically significant. That is why the number of seats (52) remains unchanged even this time.

In 1991, on the strength of the Mandal platform, the Janata Dal gained 22 seats with 21 per cent of the vote, mainly with the help of Muslims and backward classes such as yadavas, kurmis and lohars. Additionally, due to Ajit Singh, the Janata Dal attracted a sizeable number of jat votes. Former prime minister V P Singh's charisma helped to attract a section of rajput and dalit vote. However, consequent upon its several splits caused by endless factional struggles, the Janata Dal has lost the kind of support it had among the backward classes and Muslims. As a result, it has forfeited the position of being in the vanguard of secular politics and of representing the Mandal platform.

From 1992 the role of the Janata Dal was taken over by the Samajwadi Party (SP), which as Samajwadi Janata Party in 1991 won four seats and 11 per cent of the vote, banking mainly on the support of the Muslims and yadavs. The change was much clearer in the 1993 assembly elections.

By the time of the 1996 parliamentary elections, the JD had already become the junior partner. Following several splits in its ranks, the Janata Dal reconciled itself to a secondary role in the SP-Janata Dal-Left combine and contested only 17 seats, leaving the majority - 64 seats - to the SP seats, three each being contested by the CPI and the CPM. Another party to benefit from the erosion of Janata Dal's

support has been the BSP, which won three seats in 1991 and increased its tally to 12 seats with 9 per cent votes in 1993. It improved further on its earlier performance in 1996 when it increased its share of votes to 11 per cent from the 8.7 of 1991.

The performance of the Congress was as expected. It ended with the same score as in 1991 - five seats - capturing a few fresh constituencies like Rampur and Shahjahanpur, while losing some others like Farrukhabad, Mirza and Ghosi. The SP-Janata Dal-Left combine's hopes were shattered by the verdict from the eastern (Poorvanchal) and Lower Doab areas of the state. The combine, which had won 17 seats from the region in 1991, lost 16 of them this time, although it did gain one seat from the BJP. Thus, it was not the BJP leadership alone that was baffled by the outcome of 1996. Every major party in the contest was taken by surprise. There were setbacks to the BJP's calculations in the Rohilkhand and Uttarakhand regions. The party, which held 27 out of the 32 seats in the region in 1991, won only 17 seats in 1996. The major gainer of the BJP's losses was the SP, which won nine seats. The Congress, the BSP and the All India Indira Congress(T) won two seats each region.

The 1989 assembly elections brought about a radical shift in UP. It threw the Congress out of power, cut down its seats in the assembly from nearly three-fourth to less than a fourth, and brought to power a new formation called the Janata Dal, with 208 seats. Yet, it did not upset the enduring voting pattern. The apparently dramatic outcome was a result of the Janata Dal's ability to mop up the available 'opposition' votes and reduce the Congress to its minimum core - just 2 per cent less than the votes of the Janata Dal. The BJP, which did not have an alliance with the Janata Dal for the assembly elections, also retained its then stable vote share of a little over 10 per cent.

The 1991 assembly elections changed all that. Between 1989 and 1991, the hitherto familiar terrain of UP politics was transformed, stable voting patterns were upset and a large number of voters shifted loyalty. The BJP, which was till then a small and regional political force in UP, suddenly registered a rise in percentage of votes from 11.8 to 31.6 - an increase of nearly 20 per cent. While 3.6 per cent of this additional vote was because the BJP contested more seats, there was nevertheless, a genuine swing of 16.2 per cent. So strong was the BJP wave that even Rajiv Gandhi's assassination did not change the situation very much. Though a majority of constituencies went to the

polls after the assassination, the Congress could manage a marginal sympathy vote of less than 3 per cent. Overall, there was an 11.4 per cent swing against the Congress, whose minimal stable core of the last four decades was eroded, reducing it for the first time, to the status of a third party. The Janata Dal did not lose much. The combined votes of the Janata Dal and the Samajwadi Janata Party – which had by then split from the former – comprised 2 per cent more than the Janata Dal's share in 1989. But the split in its votes affected it adversely.

A combination of this swing and the split of votes brought dividends for the BJP, out of proportion to its vote share, enough to give it a clear majority of 221 seats out of 419. It retained most of its 1989 seats, but over three-fourths of its seats were wrested from others. The biggest loser was the Janata Dal. From 208 seats it came down to 92, losing an identical number of seats, to the BJP. The SJP got only 34 seats, mostly retained from its former share in Janata Dal. The Congress did not even touch 50, losing about half its 1989 seats to the BJP. The Bahujan Samaj Party (BSP) retained its small presence in the assembly, but in the process exchanged nearly all its seats with other parties.

Historical specificities – ethnic and economic – have led to distinct political trends in each of the seven regions of UP. The small, hilly region of Uttarakhanda used to be a Congress bastion till the BJP stormed it with the help of a 30 per cent swing in 1991. Former chief minister N D Tiwari was also unable to maintain the old glory of the Congress and it lost supremacy. The three regions of western UP – Upper Doab, Lower Doab and Rohilkhand have been, in the last two decades, the backbone of Bhartiya Lok Dal/Bhartiya Kranti Dal/Janata Dal politics. The Jan Sangh/BJP had some presence in Rohilkhand, but was virtually non-existent in the jat belt of the Upper and Lower Doab. In 1991, it succeeded in swinging over 20 per cent of the votes to its side in Rohilkhand and Upper Doab at the expense of both, the Congress and the Janata Dal.

Lower Doab is Samajwadi Party leader Mulayam Singh Yadav's stronghold, but the Janata Dal too, has pockets of influence here. The BJP also has a presence that cannot be ignored. In the last two elections, the BSP has also emerged as a major political force in Bundelkhand, a small region bordering Madhya Pradesh. Together with the SJP it can become the dominant formation in this region, fighting it out with the BJP and to a lesser extent, the Congress.

Avadh, the heart of UP and a traditional area of Jan Sangh/BJP influence, is likely to witness, even in the near future, a high level of fragmentation of votes, for all of BJP's rivals have some influence here. The SJP-BSP alliance has emerged as its main rival in this region and, with a mild swing in its favour, it is capable of turning the election into a keen contest. Poorvanchal, the largest region of the state, has partially tilted towards the BJP only recently. The Janata Dal is still a force to reckon with in this traditional area of Socialist influence, but so is the SJP-BSP combine and to a lesser extent, the Congress. A fragmentation of votes is therefore inevitably bound to help the BJP in future too.

There is one more point here that is important and merits some discussion and that is the dalit voting pattern in the 1989 and 1991 elections. The voting pattern among the dalit or scheduled caste population in different constituencies shows that the BSP is the only party whose votes have been going up consistently along with the rise the SC population. Interestingly, a similar inclination among the SC voters in the 1989 elections was displayed vis-a-vis the Congress and its votes went up by 8 per cent in constituencies with a high SC population. But this trend could not be maintained in 1991. The BJP vote also, in these constituencies in 1991, was 7 to 8 per cent lower than in others.

The 1993 election to the UP assembly, delivered a major blow to the secular forces. The results led to a hung assembly with the BJP and the BSP-SP combine coming to a close finish at the top. Even so, these results showed that for the time being, the forces of hindutva have been effectively

checkmated. The SP-BSP surge has also led to the virtual decimation of the other major centrist secular force in the state, the Janata Dal, which had contested the polls with a similar agenda. Its strength in the assembly has come down by over 70 per cent. The party ruling at the centre, the Congress, which went to the electorate with a soft hindutva line and presenting development as its key slogan, has been pushed further down, from 46 seats in the previous assembly to 28.

The SP-BSP put up its best show in eastern and central UP. In eastern UP, which had shown a strong inclination towards the BJP in the last elections helping it to win 83 out of 159 seats, the SP-BSP combine cost the BJP at least 31 seats. The Janata Dal lost at least 28 seats in the region while the SP-BSP gained a minimum of 54 seats. This trend is most visible in Allahabad and Benares districts, which had shown a preference for the Janata Dal and the BJP respectively in the last elections. In Allahabad, the combine improved its position from one seat to 10 out of 14 seats – leaving only three for the BJP. Here the loser was the Janata Dal, which had nine seats. Its total failure is symbolised by the defeat of veteran Reoti Raman Singh at Karchana at the hands of the BSP candidate.

In Benares, out of the 14 seats, six have gone to the combine, reducing the BJP's share to seven, three less than what it got in 1991. One seat went to the CPI in this district.

Similar is the case in central UP where the BJP lost 21 seats to the combine and made a minimum gain of 45 seats. The showing in this region, considered it to be Mulayam Singh Yadav's pocket-borough, is all the more impressive because the combine had 12 seats in the last polls. The results from Faizabad district, in which Ayodhya falls, are representative of the combine's quantum jump in the region. Here the BJP has been given a severe drubbing, its dominance now confined to Ayodhya constituency alone. Of the remaining eight seats, seven went to SP-BSP and one to CPI.

Even before all the results were out, it was clear that the combine was making

TABLE 1: VOTE AND SEAT SHARE OF THREE FRONTS BY REGION 1996

Region	1996 Lok Sabha								1996 Vidhan Sabha							
	BJP		INC+BSP		UP		Others		BJP+SMT		INC+BSP		UP		Others	
	Vote	Seat	Vote	Seat	Vote	Seat	Vote	Seat	Vote	Seat	Vote	Seat	Vote	Seat	Vote	Seat
Uttarakhand	29.5	11	22.3	—	34.6	8	7.0	—	44.7	17	21.5	20.5	2	6.5	—	—
Rohilkhand	25.7	16	22.3	13	31.9	21	3.3	—	32.9	21	27.2	10	29.7	17	4.1	2
West	38.3	69	37.6	10	25.8	22	2.2	—	35.3	47	29.7	15	31.4	35	3.7	3
Bundelkhand	33.1	11	31.6	10	23.4	—	6.1	—	31.7	7	35.8	10	22.6	3	5.4	1
Central	35.4	39	35.3	23	26.9	13	5.8	—	33.4	23	33.2	29	30.2	23	1.6	—
Poorvanchal	33.4	92	29.7	22	27.7	35	9.3	10	32.4	61	27.4	36	31.1	53	5.8	9
Total	33.6	238	25.4	78	27.8	99	6.0	10	33.8	176	28.7	100	30.0	133	4.3	15

similar gains in western UP, including Rohilkhand and Uttarakhand too. Rohilkhand saw the BJP losing six seats and Uttarakhand five. In the west, the biggest loser was the Janata Dal which had to part with as many as 20 of the 31 seats it had won in the last elections. Here, apart from the SP-BSP combine, the BJP also made impressive gains and retained the position of the largest party in the area.

The factors that contributed to SP-BSP's success and stopping of the hindutva juggernaut are many. The most important factor, it seems, is the phenomenon of tactical voting by Muslims and the consolidation of the yadav-scheduled caste votes along with the Muslim vote. The reassertion of the caste factor provides an important lesson. Hindu communal consolidation cannot continue unchallenged in the Hindi heartland for a reasonably long period. At best, it can take a commanding position intermittently, only to be pushed aside by caste and other considerations, thereafter.

1996: A YEAR OF ELECTIONS

Two parliamentary elections and four assembly elections have been held, four chief ministers have come and gone in seven years: a veritable proof of the endemic instability and churning going on in Uttar Pradesh. Parties and their managers have been trying their best to overcome this situation but all efforts have been fruitless. It's not as if the parties had not geared up to meet the situation. On the contrary, it can be argued that it was precisely the fact that each of them virtually treated these polls as a 'now-or-never' opportunity that reflected the pressures of the churning on them. A party like the BJP, the only one to have gained a majority in 1991 on the Ayodhya plank, was seeking in these polls a vindication of the solid mandate it had received in the Lok Sabha elections in the state, when it had led in 235 of the 425 assembly segments. After being ousted from power because of what he terms a BJP-BSP conspiracy in June 1995, Mulayam Singh, armed with the support of half-a-dozen other UF constituents, considered this his best chance to return to the chair he had occupied twice. For her part, Mayawati's 136 days in power in 1995 had made her and the BSP confident enough to think in terms of returning to power in alliance with the Congress to avenge her double humiliation — one meted out to her personally by Mulayam, and the other, when the BJP withdrew support and brought down her government.

The results of the assembly elections were not in favour of any party or alliance but they did explode the BJP myth that,

in any triangular contest, it would emerge winner. Not only did the party register a marginal decline in its share of seats and votes compared to 1993, its graph also dipped drastically even from its 1996 parliamentary performance. Apart from failing to retain the majority of its 1993 seats, the party suffered serious setbacks in different regions of the state. But for its clean sweep in the Uttarakhand region where it won 17 of the 19 seats, its performance has gone down in its strongest support base of central UP, as well as in the western and Rohilkhand region.

An important factor in the BJP's debacle, especially in connection with its significant losses in the western region, where it could win just 47 of the total 101 seats, compared to 56 in 1993, was the serious challenge it faced from the BKKP led by Ajit Singh and Mahendra Singh Tikait. Though the BKKP could win just eight seats on its own for the UF, it upset the BJP's calculations in not less than two dozen seats. Besides the contest of these two parties helped the BSP win eight seats in this region, against the lone seat it won in 1993. The BJP strategists were thus concentrating on the eastern districts, which account for 159 seats, and where the SP and BSP looked like losing ground after the Lok Sabha polls. But the party gained a mere nine seats over its 1993 tally, winning just 58 seats in this region — which is similar to its losses in western UP. Evidently the party's strategy of concentrating on this region did not pay off.

In central UP, consisting of districts like Etah, Etawah and Mainpuri which are considered Mulayam Singh's pocket-boroughs, the picture is not very clear. Although the BSP-Congress alliance was ahead by six seats over the tally of 23 seats each of both its rival alliances. In the earlier elections, the BJP-Samata had been way ahead of both the BSP-Congress and the UF—with 39 seats as opposed to 23 and 13 of the other two alliances respectively. The present elections therefore, indicated a sharp decline in the BJP's influence and the rise in that of BSP-Congress alliance. While its vote share did

not fall much, all its calculations were gravely upset.

An analysis of trends in various parts of the state shows that apart from the caste-communal polarisation, two factors have influenced the verdict. First, the emergence of local factors in a large number of constituencies, though these were always meshed with the larger, state-level dynamics. Micro-level caste, communal and other social considerations among the electorate generally benefited the non-BJP forces in seats like Shahjahanpur, Kaiserganj, Ghosi, Mirzapur and Rampur. Such local factors, for instance helped the Congress in Shahjahanpur and Rampur. In Kaiserganj and Mirzapur, it was the SP that was the main beneficiary of this dynamic. In Ghosi it went in favour of Kalpnath Rai. The Congress candidate in Shahjahanpur, Ram Murti Singh, a lodh rajput, gave the lie to the commonly held perception that his castemen were firm supporters of the BJP. He won a large proportion of his communities' votes from the constituency despite intensive campaigning by former BJP chief minister Kalyan Singh, himself a lodh rajput, in the constituency. Similarly, Begum Noor Bano of the Congress upset conventional calculations by bringing a large number of Muslim votes to the Congress from the SP-Janata Dal-Lefi combine. In Mirzapur, the nomination of Phoolan Devi, a dalit belonging to the mallaha community, helped the Samajvadi Party in wresting the seat from the BJP. Her candidature rallied the dalit, backward and Muslim communities behind the SP. Similarly, in Kaiserganj, Beni Prasad Verma's candidature consolidated the numerically significant kurmi community of the constituency behind the SP. This community's vote along with the SP's traditional vote bank, which consists of Muslims and yadavs, assured Verma's success.

Second, in terms of electoral arithmetic, the ascent of the BSP as a major force, especially in eastern and western Uttar Pradesh, was the main cause of the BJP's gains as that led to the division of the non-BJP non-Congress votes, benefiting it directly in not less than 37 seats. The

TABLE 2: CHANGE OF SEATS FROM ASSEMBLY ELECTION 1993-1996

Party	Seats in 1993	Seats in 1996	Seats Retained from 1993	New Seats Won in 1996
INC	28	33	9	24
BJP	176	174	83	91
SP	109	110	36	74
BSP	67	67	18	49
JD	27	7	7	-
BKKP	-	8	-	8
Left	4	5	1	4
INC(T)	-	4	-	4
Samata	-	2	-	2
Others	10	14	3	11

BSP's presence was responsible for the defeat of the SP-Janata Dal-Left combine, in at least 26 seats, including 16 sitting ones in eastern UP. Similarly, the SP-Janata Dal-Left combine affected the BSP's chances in 11 seats in eastern and western UP.

Therefore, the results of UP were generally a grim warning to the major parties. The BJP failed to achieve its targets in terms of seats and votes. The Congress and Congress(T) became inconsequential forces, confined to certain regions. However, according to many observers, the most important feature of the verdict was the message it sent to non-BJP, non-Congress secular forces of the state: stay united or forget about power.

Though the final tally of the 1996 assembly election resembles the 1993 standings of various contending parties, as far as retaining seats is concerned, this may be seen as one election where ground realities have changed drastically for each party. That almost all of them surrendered over half the constituencies they won last time is a certain pointer to an inherently unstable situation and a mood of searching among the electorate. Of its 1993 tally of 177 seats, the BJP has lost 93 seats – 41 to the SP, 20 to the BSP, 13 to the Congress, five each to the JD and the BKKP and the rest to others. Of the 91 new seats which the BJP has gained, 37 were with SP, 29 from the BSP, 12 from JD and nine from Congress. The plight of the other parties is no different. The SP could retain merely 36 of its 109 seats of 1993, the BSP only 18 of its 109 and the Congress just nine of its 28 seats. The SP lost 23 seats to the BJP whereas the BSP lost 15, and five to the SP. But the biggest and perhaps the swiftest setback has been the BJP's. Just six months after it led in 235 assembly segments, at the time of the Lok Sabha elections, it has seen its tally being limited to 174.

POLITICAL TRENDS IN UP

Politics in UP is still in a state of flux. The outcome of the 1998 Lok Sabha elections may be seen as pointing to the beginning of a new phase in which the BJP is trying to wash its image of an upper caste Hindu party and metamorphose into a broad based aggregative party. Other parties are also attempting to enlarge their support base and acquire a different profile by starting of intellectual cells, summer camps and training programmes for their cadre.

The 1998 parliamentary elections in UP clearly indicate a marked improvement in the seat and vote share of the BJP alongside the total collapse of the Congress, the

poor performance of the BSP and a marginal improvement in seat and vote share of the second largest party, the SP. Other small but important parties, the CPI and CPI(M), which had some strong pockets in the eastern districts and BKKP and the JD, which had strong base in western UP have not gained even a single seat, and only one independent (support by the BJP) candidate was successful. It is a clear indication of the polarisation and sharpening of competition among major parties and also an indication of the further move towards a multipolar system.

The current in favour of the BJP's prime ministerial candidate A B Vajpayee was an added factor this time. By still providing the main reason for the capturing 60 parliamentary seats (three by its allies) and a 37.9 per cent vote share, the party has indeed set a new record. Yet, it was not the only party to substantially increase its votes. While the BJP share of the popular vote went up by 5 to 6 per cent and the SP vote share increased by 6 to 7 per cent to 27.5 per cent while the BSP, which won only four seats (as against six in 1996) improved its vote share by 1.96 per cent (Table 1). Of course, the party suffered a significant defeat as its supremo Kanshi Ram lost in Saharanpur.

The results seem to indicate that the electorate in UP was not swayed over much by the BJP's stability slogan or the Sonia effect or the secular rhetoric of the SP or the BSP's theme of dalit assertiveness. Caste communal considerations and the anti-incumbency mood concentrated at the constituency level, and the parties' abilities to mobilise votes appear to have winners and losers.

Overall, however, the BJP gained from a division of the 'secular votes'. In 41 of 60 seats won by the BJP and its allies, the cumulative vote of the SP and the BSP was higher than that of the BJP or its ally. In seven more seats, the cumulative vote of the SP, BSP and Congress was higher than the votes secured by the BJP. In other words, if the proposed pre-poll alliance among the SP, BSP and the Congress had taken shape, the BJP might have won only 12 seats, if the voting pattern had been same. The Congress and the BKKP failed to retain even a single seat. As a result of such constituency-level anti-incumbency sentiment, the SP made same gain in some BJP strongholds, for instance in Bijnor in western UP, Faizabad and Hardoi in central UP likewise the BSP made gains in Anola, Kairana and Amroha in Rohilkhand and Rampur, Saharanpur, Meerut, Farrukhabad, Khurja and Muzaffarnagar in western UP which are considered Muslim dominated, and therefore SP bastions.

As Table 2 shows BJP performed well in all region – in none of which, apart from Bundelkhand, it had a base earlier and successfully mobilised a large chunk of the upper caste Hindu vote across the state on the basis of regional issues. An analysis of its pattern of regional support points to this: it was able to win every constituency in only 7 districts, but it was able to capture at least half of the total constituencies in 26 districts, pushing back the Congress and the JD in the hill region in 1991, it had gained the votes of the upper caste and thereby wrested all the four seats mainly from the Congress which had been dominant here from a long time. The story is almost same in this election too. Other regions where it made a clean sweep are Bundelkhand and central UP.

The success of the BJP was most marked in the western region which has traditionally been the area where new social forces made their presence felt and has experienced sharp electoral swings. In the early 1990s, the hindutva ideology appealed not only to the upper castes but also to the dominant agricultural castes in the region, such as jats, rajputs and gujars (Table 5G). This region was no longer attracted by the agrarianism of the JD which also had the informal support of the BKU, or by the reservation issue which had significant appeal among the BCs/OBCs and no appeal for the jats. By the late 1980s, surpluses from agriculture were declining compared to the earlier support under the green revolution while industry had also made inroads into these areas. The massive mobilisation of the OBCs under JD/SP and the dalits under the BSP was perceived by them as threatening their dominant positions in the countryside. It is this surplus producing peasant class which was attracted by the BJP in 1991 and they shifted from the JD which they had supported in the 1989 elections. They found, in the hindutva ideology, a useful counterpoint to the Mandal issue, and agrarian issue took a back seat.

The BJP improved its Lok Sabha election performance in UP as a whole but faced problems and reverses in the biggest region of the state, namely the Purvanchal.

TABLE 3. CASTE GROUP AND VOTE PREFERENCE, ASSEMBLY ELECTION 1996

	BJP+ Samata	INC+ BSP	UF	Others
Forward caste	76.8	6.7	8.6	7.9
Land-d backward	26.4	12.2	51.8	9.6
Most backward	53.1	19.2	19.9	7.8
Scheduled caste	8.3	73.0	14.0	4.7
Scheduled tribe	58.3	16.7	25.0	0.0
Muslim	2.3	24.9	67.6	5.2
Others	40.9	24.2	26.8	8.1

It covers 33 parliamentary seats and has always proved to be a stumbling block for the BJP. Whereas the BJP once again appeared to be caught in the social equations of the regions, the SP and the BSP strengthened their position (Table 1). In the process, the BJP lost one seat but its ally Samata Party gained one neutralising the loss. The SP gained three seats and the BSP got one more seat. For the BJP it was puzzling that its arch rival the SP wrested from it seven seats.

A striking fact emerging in these elections is that backwards (mainly yadav)-Muslim polarisation and dalit upsurge not only remain intact but appears to have further sharpened. The BSP apart from having a monopolistic hold over dalit votes had also been able to attract the backwards among backwards (Table 5).

In recent years, polarisation is also being witnessed among the forward castes but it is not as sharp as the backward-Muslim polarisation and the dalit upsurge. Precisely because of this the SP could get the support of a section of the forward castes, mainly rajputs in a few constituencies by just putting up a caste candidate. It is not that the BJP has the support of only the upper castes. In recent years the party has been able to win the support of the economically better off backwards (Table 5). However, it is the polarisation of votes along caste lines which dominated politics in the region. In 1996 Lok Sabha elections the party success rate in Poorvanchal was 8 per cent less than that in the rest of the state. The region comprises 39 per cent Lok Sabha seats and 41 per cent assembly seats of the state and is therefore of crucial importance for any party.

After the destruction of Babri mosque, the BJP leadership began to realise the limitations to religious mobilisation. It found that the crowds in election meetings did not respond to the virulent anti-Muslim speech and did not approve of the actual destruction of the mosque or the 'Ekatanata Yatra' (march for unity) of the VHP. Advani's Su-raj yatra too met with an embarrassingly low response. Therefore the party decided to project itself as a responsible national party. It decided to broaden the party's appeal to all sections of society, taking up also their issues – especially, those of the dalits – alongside its other issues like Article 370, infiltration of the foreigners, uniform civil code, Ayodhya temple issue and particularly, economic nationalism and swadeshi. The increase in the seat and vote share by a few points in the 1998 elections is hence an important breakthrough for the BJP, as it intends to present itself as moderate party under the leadership of Atal Behari Vajpayee and thereby gain the support of

a broad cross-section of the electorate. Certain features of the BJP's pattern of support are indicative of this change (Table 3).

POLITICAL TRIANGLE

The party system in UP today has three poles, the BJP, the SP and the BSP, and the challenge to the BJP is from the latter two parties. Hence analysis of this triangular relationship will throw light on future electoral trends. The SP which has improved its seats and specially its vote share by 6.7 per cent over the 1996 elections could form the second pole of emerging party system. The SP arising out of the JD has been successful in UP unlike in other parts of the country due to the two-pronged strategy pursued by Mulayam Singh since 1989: Firstly, by taking advantage of the increasing caste-based consciousness and agrarian prosperity in the state following from the second spurt of the green revolution, it carved out a backward caste base initially based upon the AJGAR strategy which has been broadened to include more groups. Secondly, it distanced itself from the BJP by promising protection to the Muslims and gaining their support. The alliance between the SP/BSP was also beneficial to both as they managed to consolidate and expand the backward caste – the scheduled caste and the Muslim base, in the many key constituencies. While earlier the base of these parties was largely confined to the yadavs and jatavs, it expanded later to include a large section of the kurnies and the lodhis (Table 5).

The SP is the only party which has consistently and successfully opposed the BJP since 1980s. In both the eastern and the western plains the major interchange of seats over the last two elections in the rapidly changing and fluid situation has been between these two parties. This points to the keen competition among them. In the 1998 elections Mulayam Singh Yadav

charted an independent path for his party, keeping distance from both from the Congress and the JD. During the election campaign, the SP, in order to gain the support of the Muslims, stressed that the BJP remained a Hindu upper caste party, and tried to cut into the backward and dalit support base of the BSP. The base of the SP has been the plains of west UP and to a larger extent the eastern plains. As Table 2 shows, in spite of the BJP performing well, the SP managed to retain certain core areas. Without the benefit of an alliance with its earlier partner the BSP, the SP could gain 20 seats and 27.5 per cent of the votes and contain the BJP pockets specially in western districts and it was able to take back from the BJP Bijnor, Hardoi, Kannauj, Kheri and Gonda, Balrampur, Deoria, Gazipur and Faizabad in eastern UP. The Muslim community has supported the SP notwithstanding the BJP's much publicised victory in places such as Rampur (Table 5). However, the SP could not gain the support of a section of the upper castes – the rajputs – and obtained the support of only a section of the backwards.

The performance of the BSP – perceived in the early 1990s as a party poised to emerge as a strong state level dalit-based party – has been disappointing in the 1998 elections. In the 1989 Lok Sabha elections it gained only two seats but 9.9 per cent votes and made impressive inroads into the Congress Party's SC and minority vote bank. In the 1991 and 1993 assembly there was a marked improvement in the performance of the party from 12 to 66 seats though in terms of votes the increase was only about 1 per cent. It moved closer to the SP on the common platform of establishing a Bahujan Samaj. However, due to the failure of this experiment and its alliances with the BJP in 1995 and 1997 and the Congress prior to the 1996 assembly elections, the party has entered a regressive phase. These opportunistic alliances also led to its isolation from other

TABLE 4: CASTE AND VOTE PREFERENCE, ASSEMBLY ELECTION 1996

mainstream parties and prior to the 1996 Lok Sabha elections, many parties in the National Front were opposed to its inclusion, viewing it as an unprincipled party. In the resulting division of votes the BSP gained only 59 seats but managed to gain 20 percent of the votes. A moderate section consisting of dalits and backwards within the party advocates a closer relationship with other parties, while the hard-core dalit members feel it will lose its distinct identity and social constituency as a dalit party if that happens. This has led to factionalism and splits. An authoritarian style of leadership is also resented within, and therefore, there has been further division within this group, weakening the party on the eve of elections. This may be one reason for its decline.

Another significant reason for the decline of the party is that during both the short periods when it was in power in 1995 and 1997, the BSP introduced a number of exclusively dalit-oriented policies in the field of education, social welfare, employment generation, and channelled a large proportion of state funds in to the Ambedkar village programmes. This has created considerable anguish among the MBCs, particularly those who feel that in spite of being backward and in many cases poorer than the dalits, the BSP government has neglected them. Even among the dalits, it is the jatavs who have benefited, the balmikis and pasis have not – and this led both these groups to vote for the BJP in the 1996 elections. As a result, the BSP prior to the 1998 elections was faced with alienation of the BCs, slow growth of its social base and the lack of alliance partners which led to a division of votes favouring the BJP. The party, however, retains the potential to challenge to SP.

The base of BSP since its inception has remained confined to eastern UP and Bundelkhand and parts of central UP. It has been trying to enter western UP and has pockets of support in regions of chamar jatav concentration. Its failure to do so has been due to the success of the BJP and, to a lesser extent the SP. It did gain a seat in western UP in both 1991 and 1996; Etawah and Sambhal, respectively; but has lost both in 1998. However the party succeeded in its attempt to make inroads into west UP; polling a good percentage of dalit votes which should allow it to expand beyond its strongholds in the eastern UP and Bundelkhand. In the 1998 elections, the BSP has been pushed back to the eastern UP and has not won a single seat elsewhere (Table 2). However, it has been able to improve its vote share by 1.96 per cent particularly in the eastern districts like Akbarpur, Azamgarh, Bahraich and

Mishrikh where it had put up Muslim candidates and gained their support.

Despite the changes visible in this election, the BJP has not emerged as a broad based dominant party in UP on the lines of the Congress Party earlier. There are in fact important structural limitations to the continued expansion of the BJP in UP, unlike in states such as Gujarat and Rajasthan, where it has become a well established party. The SP and particularly the BSP, in spite of its poor election performance are well established parties with strong social and regional bases in UP built over a considerable period of time. If they were to join hands as in the past of which, lately, there have been indications, they are capable of posing a strong challenge to the BJP. Moreover,

due to rigid caste polarisation, the BJP would find it difficult to gain the support of either the dalits or the backwards who have in the recent past shown a preference for the BSP and the SP whenever these parties have formed a winning coalition. In contrast, although the BJP has managed to spread into all regions of the state, the constant shifts in the social and regional base over the election base indicate that it has yet to strike firm roots. Moreover, for important historical reasons, the chances of the party like the BJP gaining the support of the Muslim community are low since the community view the party with suspicion, believing that after achieving power it might return to its ideology of hindutva. The compulsions of coalition politics dictate the need to moderate its

TABLE 5: WHO VOTED WHOM

ideology and make it more accommodative towards the aspirations of the backwards and the dalits. Whether the BJP actually manages to change remains to be seen.

Instability, it would appear, is a continuing feature of UP politics. Since 1989, UP has had close to half-a-dozen governments run by as many political parties and combinations. The uncertain verdict of the 1996 assembly polls has only added to the confusion rather than offering any hope of a solution. If we see elections simply as means to the formation of governments, these have certainly not been able to produce any definite results. But if we try to understand their deep-rooted lessons and outcomes, we will be able to appreciate their import as instruments of social change. Responding to the deep processes of churning among various strata, every political party was forced to change both its strategy and programmes as well as its composition, through the induction of a larger number of scheduled caste, OBC, women and Muslim candidates. This era may also be seen as one of resurgence of dalits under the dual leadership of Kanshi Ram and Mayawati, who were emerging as unquestioned 'masihas' of the lower castes. On the other hand, the backward

castes and the Muslims are attracted towards Mulayam Singh's Samajvadi Party or its alliance with the JD and the Left.

The first indication from these election of 1996 and 1998 is that the electorate is treating politics as something regional, even local – rather than national. In the absence of someone who can capture their imagination with an ideology that cuts across caste and communal lines, the voters have opted for whoever spoke for their interests, aspirations and needs. That local issues are more important was evident even in past elections, as the poll surveys conducted by the CSDS confirmed. Recent electoral mandates and the overall turbulence of the times, suggest that the anger of the electorate against most political parties or alliances is quite pervasive as is the impression that they do not fulfil peoples' day-to-day needs such as water, housing and sanitation, etc.

The strategy of Samajvadi Party to expand its support bases among the upper castes worked well in these elections. The party has eaten into a sizeable number of upper caste votes of the BJP. Out of the 110 seats won by it, the SP has wrested 39 seats from the BJP. The SP has gained

a total of 72 new seats. The SP fielded about 30 rajputs out of which 11 have won, eight of these it wrested from the BJP, though it too had to lose 10 of these 30 seats. The SP has been successful in getting the support of other high caste votes through the Congress and by using the services of a rajput industrialist Amar Singh, who was made general secretary of SP.

Notwithstanding its image of representing the scheduled castes, the BSP fielded 57 upper caste candidates this time. Out of them, nine were winners in their respective constituencies. Among them are two brahmins, four thakurs, and the rest belong to other upper castes. Most of these seats are in the Poorvanchal region. The BSP also tried to get Muslim support and ended up with 17 per cent of its MLAs being Muslim this time. The BSP fielded 54 Muslim candidates; out of these 12 were winners in their respective constituencies such as Bijnor, Kundaki, Bisalpur, Lahapur, Tulsipur, Salempur, Mau and Jehanabad assembly seats. The BSP had fielded as many as 102 candidates from other backward classes, 26 of whom won. The BSP has only 20 scheduled caste MLAs in the new assembly out of 86 candidates.

The pre-eminence of the Congress in Maharashtra politics was based on two disjunctions. One, while it claimed to represent the oppressed caste it was a maratha-kunbi supported and dominated party. Two, while it drew support from rural agrarian voters it served urban industrial interests. Emergence of the BJP-Shiv Senu alliance marks an end to the disjunction between material and political domination. The alliance is supported by urban, educated voters in the younger age groups and serves their interests.

AFTER a long period of resilience the Congress in Maharashtra finally faced electoral humiliation in the 1990s. This turn in the electoral politics of the state poses two questions: (a) what movement of popular vote made this change possible? and (b) how is the Congress defeat related to a restructuring of dominant interests? The following paper attempts to answer these questions and link the electoral process in the state to a more general dynamics of political economy of Maharashtra.

Electoral process is usually associated with 'politicking', infighting within the party, the excitement of selecting candidates and campaigning – all these factors are exacerbated by the media-hype accompanying elections. But over and above this excitement, electoral politics is firmly rooted in the interplay of social forces. Two types of confrontations constitute politics. In the first place, confrontation takes place between dominant interests and the dominated masses. This relationship is often shaped by material factors, social status and identity question. The second confrontation takes place among the dominant interests for a better share in dominance. In case of both these confrontations, elections provide a crucial opportunity for contending sections to assert themselves. The dominant interests seek continuation of their dominant position through elections while the people look upon elections as an opportunity to intervene in the process of domination. In this sense, electoral politics constitutes popular perception of and response to the prevalent pattern of domination. Therefore, electoral politics cannot be understood in isolation from the politics of domination. Our analysis, then, is informed by this understanding that elections combine democratic expression and expression of domination.

I

Pre-eminence of Congress

Caste composition of Maharashtra's politics and the pre-eminence of Congress party stand out as the most significant

features of politics in Maharashtra. Both appear to have come under serious challenge during the 1990s. Brahmins account for less than 4 per cent in Maharashtra's population; while the maratha-kunbi caste cluster accounts for over 31 per cent [Lele 1990: 116-17]. maratha-kunbis are traditionally engaged in agriculture and related occupations and are spread almost all over the present state of Maharashtra. There are internal differences among the maratha-kunbis on the basis of caste status as well as economic stratification. However, through a historical consciousness of 'kshatriyahood', a common battle with brahmins, a common material experience as peasantry and a process of adroit political integration the maratha-kunbi group has emerged as a political force in the state, [Lele 1990: 124-35, 162-697]. It may be noted here that the Mandal commission has included the 'kunbis' in its list of other backward classes (for Maharashtra). However, in many parts of the state, distinction between marathas and kunbis is often blurred particularly with the rise in the incidence of marital alliances between the two. Thus, internal stratification notwithstanding, maratha-kunbi caste cluster has existed as a single political entity for the most part since independence. Its formidable share in population ensured the domination of this community over electoral politics and made Maharashtra famous for 'maratha domination' during the decades following the formation of the state in 1960.

The pre-eminence of Congress was, in a sense, an all-India phenomenon in the post-independence period. But two features of Congress domination in Maharashtra distinguish the state's politics from that of other states. During the 50 years since independence, Congress enjoyed power in Maharashtra for over 46 years (1947 to 1978 and 1980 to 1995); and when the first non-Congress government came to power (1978) it was led by a Congress faction. This non-Congress government could come to

power because of a split in the Congress. Secondly, and more importantly, the pre-eminence of Congress was deep-rooted and based on a combination of political majority and ascendant material interests. The structure of dominant material interests is sketched below. Congress in the post-1960 period successfully attempted to accommodate entrenched interests. At the same time, political legitimization of Congress power derived from the fact that at the social level, Congress claimed to represent the ordinary masses – the 'bahujan samaj' (an euphemism for non-brahmin and usually non-dalit castes). The Congress could sustain this claim to being a party of the bahujan samaj because both at the level of leadership and following it had undergone a transformation from an upper caste character to a middle peasant (maratha-kunbi) base, since late 1930s onwards.

Congress presided over a complex set of entrenched interests competing with each other. The maratha leadership, which exercised political control over material resources, always accommodated the interests of brahmins and while the latter lost political initiative there is nothing to show that material interests of brahmins were jeopardised in any way. Lele (1990: 67-72) and Vora and Palshikar (1990: 238-40) have separately argued that there has generally been a sharing of interests between brahmins and marathas and that the cultural pre-eminence of brahmins has generally been a result of this collusion. Also, industrial interests have generally benefited under maratha political dispensation [Kamat 1983: 80, 87-90]. Vora has discussed at length the limitations of 'maratha dominance thesis' in the context of political economy of Maharashtra [Vora 1994: 1-3, 32-33]. Thus, Congress rule could protect agrarian interests only by accommodating brahmin interests and 'hending backwards' [Kamat 1983: 87] in pursuing capitalist interests. In this sense, material resources were jointly controlled by agrarian and capitalist interests.

This complex arrangement of entrenched interests was obviously not without tensions. In fact, internal competition marked the relations among the entrenched interests. Relations between Brahmins and marathas are marked by competition as well as by sharing of interests. Marathas have also found it difficult to placate the emergence of political ambitions among vocal sections of scheduled castes. And while the Congress always claimed that its rule was representative of 'bahujan samaj' the maratha leadership always avoided mobilising the non-maratha, i.e. OBC castes. All this goes to suggest that although marathas gained access to political power and material resources, they were far from enjoying substantive hegemony vis-a-vis the caste society.

In the early 1970s Indira Gandhi attempted to undermine the hold of maratha leadership over Congress [Lele 1990:177-85]. The peculiar social composition of Maharashtra did not allow her to prop up a social force against the marathas but she could shake the confidence and complacency of state leadership. Her challenge widened the cracks among the many factions of maratha leadership [Palshikar 1994:273-74]. Around the same time, industrial interests began asserting themselves. The state had already adopted policies favourable to industry. A number of institutions had been floated to finance and provide infrastructure to industries. During the 1970s, the state government almost totally abdicated its regulatory role as far as industrial expansion in the Mumbai-Thane belt was concerned. The plan of backbay reclamation was pushed ahead and a twin city of New Mumbai was planned. Under onslaught from capitalist interests, political leadership failed on two counts. Firstly, it failed to check unplanned growth of Mumbai-Thane-Pune belt. It yielded to demands made by capitalist interests [Kamat 1983:79-81, 86-88]. Secondly, state-level political leadership failed to protect the interests of agriculture – a sector to which it belonged.

Between 1960-61 and 1970-71, area under production of cereals and pulses remained stagnant and yield per hectare actually declined [GOM 1996:141]. Similarly, between 1960-61 and 1975-76 percentage of gross irrigated area to gross cropped area improved by 3 per cent [GOM 1996:143].

Not surprisingly, share of primary sector in state income went down by over 10.5 per cent (from 41.9 per cent to 31.6 per cent) between 1960-61 and 1975-76. During the same time both secondary and

tertiary sectors registered a growth of 5 per cent each in the state's income [Kamat 1983:82].

Economic development of Maharashtra has not been without its own problems and imbalances. The period between 1976-77 and 1986-87 shows that its economy had a stunted growth. It also shows a lack of ability on the part of politicians to protect agrarian interests. As a result, the trend of declining share of primary sector continued. Between 75-76 and 86-87 primary sector shows a downfall in its share of state income by 10 per cent from 31.6 per cent to 21.4 per cent [Kamat 1988:82; GOM 1996:116]. On the other hand, the secondary and tertiary sectors grew but did not grow sufficiently for the state to record a fair economic development. In 1976-77 Maharashtra's net domestic product accounted for 12.6 per cent of national income [Kamat 1983:81]. This share went down to 11.7 per cent in 1986-87 [GOM 1991:5]. Trends in state income and national income at constant prices (80-81) show that while state income increased by 14.4 per cent between 1980-81 and 1984-85, national income increased by 20.9 per cent for the same period. In 1985-86, state income increased by 9 per cent [GOM 1996:12-13].

Even this moderate development of secondary and tertiary sectors had some problems. Firstly, it did not keep pace with rising levels of education and expectations.¹ As a result, number of persons on the live registers of the employment exchange increased by three times between 1975-76 and 1985-86 [GOM 1996:187]. The number of factories increased from 11,923 in December 1976 to 19,966 in December 1986, but employment rose only by a 10 lakh and actually declined between 1981 and 1986 [GOM 1996:132]. While, growth showed signs of a slump, the state continued to pump its resources generously into capitalist development. Financial assistance disbursed by financial institutions rose from Rs 372 crore in 1980-81 to Rs 7,871 crore in 1995-96 [GOM 1997:160]. Thus, state-sponsored capitalist growth failed to spread across sections of population. Besides, industrial growth occurred at a dismally slow pace in most parts of the state. Mumbai-Thane and Pune continued to be the major sites of growth. Of the total factory workers in 1986-87, 66 per cent were employed in these three districts [GOM 1991:38-39]. This suggests that while industrial growth in other districts was very slow, they experienced growth in tertiary sectors mainly through petty businesses. This created not only an

economic imbalance but social distortions too state-level political leadership continued to derive political support from rural agrarian masses and to cater to the material interests of urban-industrial and service sectors. Thus, agrarian interests became less effective than earlier vis-a-vis capitalist interests based in urban centres. Another development that firmly emerged during this period was the increasing role of tertiary sector. It ensured the change in the economic complexion of the state. While industry recorded a steady pace of growth, the service sector was constantly on the ascendant. In concrete terms, petty contractors, hoteliers, speculators and traders became increasingly important in the state's economy.

In a sense, 1977-78 marked the beginning of a phase which finally culminated in the defeat of the Congress. The period between 1978 and 1995 was characterised by disintegration of maratha leadership and changing complexion of the alliance of material interests. Congress performance in Maharashtra in the 1977 lok sabha election was poor. It won 20 out of 48 seats. This poor performance of the Congress was partly due to the emergency and to post-emergency unity of non-Congress parties. But in 1977, Congress in Maharashtra was already a divided house. Since 1972, state Congress had three groups. One was loyal to Y B Chavan while another group derived its power from sugar co-operatives and maintained a distance from Y B Chavan. This latter group was informally led by the maratha leader Vasantdada Patil. Both these factions had their social base among the maratha-kunbi community. The third faction, mainly opposed to the sugar co-operatives, was led by the Marathwada-based S B Chavan. S B Chavan, himself a maratha, had little support from the maratha-kunbi community. After the 1972, Indira Gandhi sought to destabilise the maratha leadership with the help of S B Chavan. He replaced V P Naik as chief minister in 1975. This led to intense factionalism during the 1977 lok sabha election where interests of Y B Chavan and Vasantdada coincided. The results of 1977 elections were, therefore, in no small measure, an outcome of factionalism within Congress [Vora et al 1988:71-72]. After Congress split at the national level in 1978, the two factions – Indira loyalists and maratha leaders – fought the 1978 assembly elections separately but joined hands to form a coalition ministry. Soon, Sharad Pawar went on to form his separate faction breaking away from the loose alliance of maratha leaders. Pawar's

parallel Congress formed a coalition ministry along with Janata party and PWP (July 1978).² This dealt a blow to the already fragile unity among maratha leaders and since then the maratha leadership has not been able to put its act together. When Indira Gandhi returned to power in 1980 she swiftly dismissed the Pawar government. Between 1980 and 1984, the maratha leadership faced humiliation at the hands of Indira Gandhi. Although Vasantdada Patil and some other leaders went back to Indira's Congress, a string of chief ministers not belonging to maratha leadership was imposed on the state with the maratha leadership standing by as mute witness. This scenario continued even after Indira Gandhi's assassination. Between 1978 and 1988, the maratha leadership was in a state of disarray. It lost initiative along with loss of unity.

These developments facilitated the growth of the Shetkari Sanghatana and neo-Hinduist forces. Farmers' movement under the leadership of Sharad Joshi took shape after 1978. Joshi took up agitational forms and mobilised the rural masses. The agitations of Shetkari Sanghatana were the first statewide mobilisation on mass scale since the formation of Maharashtra. However, after an initial success, the Shetkari Sanghatana lost initiative [for details see Doshi 1990: 215-30; Lennberg 1988: 446-64]. For about six years the Sanghatana successfully mobilised the maratha-kunbis as well as OBC groups, particularly mali and vanjari in parts of western Maharashtra (Nasik, Ahmednagar) but more notably in Marathwada and Vidarbha regions.

Since the rise of the Janata party small activist groups claiming allegiance to militant Hinduist ideology were active in parts of Maharashtra. They were different from RSS in that they were active in rural areas, small towns and attracted youths from the non-brahmin castes. After 1984 Shiv Sena too, entered rural Maharashtra. It took up an explicitly Hinduist position and started wooing OBC youth in Marathwada. Youth from different castes seized this opportunity since the Congress was a dilapidated force and also because of the ideological appeal of Sena's militant Hinduism. The Shiv Sena skillfully exploited the anger and frustration among both rural marathas and OBCs on the issue of change of name of the Marathwada university. The caste sensibilities of caste Hindus (savarna) were combined with their religious sensibilities. The latter were being shaped in the course of the 'Ram Janmabhoomi' agitation. The tempestuous Hindutva brigade soon sidelined the

Shetkari Sanghatana. Thus, new political forces emerged while the Congress witnessed an internecine struggle among warring factions of maratha leadership.

Sharad Pawar became Congress chief minister in 1988. He vigorously pursued the economic policy of liberalisation. He made an attempt to situate further industrial expansion outside of Mumbai, Thane and Pune. Nasik, Jalgaon, Aurangabad, Kolhapur and Ratnagiri districts became the sites for rapid industrial development. State support to industry continued. Assistance from financial institutions increased ninefold between 1985-86 and 1995-96 [GOM 1997: 160]. Over 8,000 new factories were set up during this period. In 1991-92, the tertiary sector recorded its highest share in SDP when it reached 46.5 per cent and remained around 44 to 45 per cent in the later period. While many of these trends had existed earlier also, during Pawar's second (and third) stint as chief minister, these trends became stronger. Besides, unlike in the earlier period, there was very little mention of agriculture. Pawar enthusiastically took up the theme of industrial development and made it a major plank of election campaign later in 1995. Not surprisingly, his tenure was marked by acrimonious charges of corruption and the same were exploited by his opponents in course of the campaign. Pawar came to be identified with modern capitalist development and with shady deals and fast track of corruption.³

Two other features of Congress rule in the 1990s were manipulative politics based on ad hocism and inability to handle the communal situation. It was evident since 1989 that Congress' control over politics in the state was weakening. Pawar sought to remedy this situation by employing a series of manipulative strategies. Mandal recommendations were accepted by allotting separate reservations to various caste groups from among the OBCs. A few non-maratha leaders were projected to assuage the politically strong castes such as dhanagars and malis. Development boards were planned and eventually formed for the backward regions of Vidarbha and Marathwada (along with one for the rest of Maharashtra). Alliance with one faction of RPI was formed; Marathwada university was finally named after Ambedkar. A split in the Shiv Sena legislature party was engineered and one in the Janata Dal was also effected. (The growth of Shiv Sena in Marathwada and Vidarbha regions was mainly due to the emergence of Bhujbal, a leader belonging to the OBC 'mali' community. Dissension between him and Manohar Joshi, a brahmin leader of Shiv

Sena was the factor ultimately leading to split among Shiv Sena MLAs. The ostensible reason was Shiv Sena leadership's anti-OBC stance. In the case of Janata Dal, the split was an easy matter since the state unit of party lacked in leadership, cohesion and direction.) A policy document on women's issues was brought out. But all these strategies lacked any long-term planning or deep-rooted commitment. Issues were handled, more or less, in isolation. An attempt to create a support base was not made.

The communal situation worsened in the aftermath of the demolition of Babri masjid. The government led by Sudhakar Naik could not handle the riots of December 1992 effectively. Mumbai witnessed the worst riots in January 1993 during which the communal bias of the police force became an issue. The Congress could not satisfactorily rebut charges of a nexus between the underworld and the politicians. Ignoring these problems, Pawar seized this opportunity to settle scores with Naik and subsequently returned as chief minister. The bomb blasts in March 1993 further strengthened popular perception that Mumbai was ruled by the underworld. These events were to play a key role later during assembly elections of 1995.

From 1978 onwards and particularly in the 1990s, the Congress remained in a disarray. Organisational activity came to a standstill. The party lost all ability to mobilise the masses. At the state level, Congress could retain power because of the limited strength of non-Congress parties in rural areas. But the Congress had lost initiative right since the disintegration of the maratha leadership in 1978. Between 1978 and 1990, the state witnessed an acute disjunction between political-electoral domination and the ascendancy of new forces in the material realm. As we noted above, industry and service sector became increasingly dominant. With this development, the role of urban centres became more significant. The gulf between urban sensibilities and rural sensibilities further increased. A new section of upstart capitalists and the urban rich started making its presence felt. These developments meant that control over rural resources alone was not sufficient to enjoy material domination. The Congress Party in Maharashtra did not realise this problem and continued to exercise control over co-operatives, zilla parishads, etc. Pawar attempted to rejuvenate the earlier alliance between rural rich and the urban material interests.

He sought to combine political domination with material domination. In the arrangement which Pawar was seeking,

urban material interests were to have a free hand not only in urban development, but in the field of rural development also. Export oriented agriculture, horticulture, tourism, new agro-based industry were some of the areas hotly pursued by the Pawar government. This arrangement implied that material relations will be evolved on the terms of urban interests. The rural rich could participate in implementing but not in framing these relations. In exchange, Pawar sought continuation of political domination on existing lines, in which marathas would be allowed to formally preside over the state apparatus. The political leadership was, however, not supposed to pursue its own material interests. In other words, Pawar, like the central leadership of the Congress, sought to convert the party into a political vehicle of the newly ascendant and aggressive material interests.

II Downfall of Congress

This strategy did not succeed. It hurt rural interests and failed to attract urban voters. The inevitable result was that Congress was unsettled from power and had to give way to a new political combination more acceptable to the alliance of material interests [Vora and Palshikar 1996:122-24]. How did this story of Congress decline unfold electorally? We discuss this question below.

The lok sabha elections of 1989 witnessed triangular contests in most constituencies. The BJP had entered into alliance with Shiv Sena for the first time during these elections, both for reasons of ideological proximity, as well as because the Sena was fast emerging as an aggressive oppositional force. Although BJP is a national party, it had no option but to continue its alliance with Shiv Sena. While the BJP traditionally enjoyed the support of brahmins, banias and the middle class, the Shiv Sena was able to attract OBC youth in urban as well as rural areas. This forced the BJP to ally with Shiv Sena in spite of differences (e.g., the two parties had different stands on the 'namantar' issue, on the issue of OBC reservations and later, on the issue of revival of the Enron project) and accept its domination. Although Janata Dal and its allies did not have a formal alliance with the BJP-Shiv Sena combine, they had an electoral understanding in a number of places. This avoided division of non-Congress votes to some extent. The overall atmosphere in the country was also not favorable to Congress. These factors together resulted in a setback to Congress. It secured 28 seats

but its vote share remained more or less intact (45.3 per cent). The real gainers were the BJP and Shiv Sena, with 10 and four seats respectively. It may be noted that both BJP and Shiv Sena won most of their seats from urban constituencies which were more receptive to the issue of corruption raised during the campaign. The alliance benefited from the appeal of hindutva generated through Ramshila-poojan programmes during the campaign. Urban support to politics of hindutva thus became evident for the first time through these elections.

The non-Congress parties could not follow up this success in the 1991 lok sabha elections mainly because of the changed atmosphere due to the assassination of Rajiv Gandhi in the middle of campaigning. Although both the issues of Mandal and Mandir played an important role in campaigning, they had no effect on the outcome of elections. Even in this adverse condition the BJP managed to win five seats and the Shiv Sena retained its four (it actually retained two seats and won two new seats). The BJP projected its leaders from OBC castes such as Gopinath Munde (vanjari), N S Pharande (mali) and Anna Dange (dhangar). The real loser was the Janata Dal which failed to win any seats and lost its image as an opposition party, losing all initiative to BJP-Shiv Sena alliance.

Between these two lok sabha elections the crucial assembly elections had taken place in 1990. These witnessed a major setback to the Congress. The Congress lost clear majority and its share in popular vote went below the 40 per cent mark. The BJP and Shiv Sena posed a direct challenge to Congress dominance by winning 94 seats. More importantly, these elections helped in consolidating their support base in most of the urban centres in the state.

As in 1989, there were triangular contests in most constituencies. While BJP-Sena alliance continued, Congress entered into an alliance with one faction of Republican Party (led by Ramdas Athawale) with a view to gaining some additional dalit votes. This move resulted in the split in the United Republican Party which was created in December 1989 by bringing together many Republican factions [Morkhandikar 1990:588]. A third alliance consisted of Janata Dal, PWP, both the Communist parties, Shetkari Sanghatana, Kamgar Aghadi (led by Datta Samant) and factions of Republican Party. This alliance was known as Progressive Democratic Front (PDF). The PDF accommodated some Congress rebels also. Campaign in 1990 was marked by Sena's aggressive hindutva propaganda and weak attempts by PDF to win the OBC constituency. Pawar led the campaign on behalf of the Congress. Regionwise analysis of the 1990 results shows that the BJP-Sena alliance consolidated its base in the Mumbai-Konkan region. Although the two regions are separate, Konkani vote is usually influenced by voting in Mumbai. This is due to strong economic links between the two regions and influence of the metropolis on adjoining areas. Apart from Mumbai and Konkani the alliance made inroads in Vidarbha and Marathwada regions. Western Maharashtra continued to remain a strong base for Congress (Table 1). These trends indicated decline of support to Congress in as many as four regions. Two of these regions are dominated by urban constituencies or effects of urbanisation (Mumbai and Konkani). The other two regions are marked by backwardness and a none too impressive co-operative network (Vidarbha and Marathwada). In particular, decline of support in Vidarbha and Marathwada meant disintegration of

TABLE 1: ASSEMBLY ELECTIONS RESULTS - 1990 AND 1995

Congress base among rural voters and among maratha-kunbi and OBC voters. This shrinking base of Congress was to prove critical in the elections of 1995-96.

Assembly elections in 1995 brought about transfer of power in the state in more than one sense [Vora 1996:171-73]. Sena-BJP alliance won 138 seats and formed government with support from independents, most of whom were rebel Congressmen. The lok sabha elections in 1996 witnessed continuation of the trends which emerged in 1995. These elections confirmed the decline of Congress in the state.

The assembly elections had a background of Congress rule between 1991 and 1995. Campaigning was dominated by anti-Pawar propaganda. Corruption and the alleged nexus between politicians (of ruling party) and criminals became the main issues. Some bureaucrats also supported the anti-Pawar campaign. BJP and Shiv Sena could not oppose Pawar's economic policies since they too believed in liberalisation. Therefore, they focused on mismanagement and corruption. Pawar was made the target for another reason. He was the only leader in the Congress with mass base and the alliance hoped to penetrate rural electorate by discrediting Pawar. This strategy worked successfully for the alliance so much so that later, in the lok sabha election of 1996, acrimonious campaigning was not required. As a result there was no strong campaign in 1996. In both the elections non-Congress, non-BJP parties did not play a crucial role during the campaigns. Thus, these elections were triangular in terms of candidates and alliances but there was a direct confrontation between Congress and Sena-BJP alliance. In 1995, the Janata Dal formed the PDF along with PWP, two factions of Republican party. Samata Party and Samajwadi Janata Paksha. The Bahujan Mahasangha, Bharatiya Republican Party (led by Prakash Ambedkar), both Communist parties, Kamgar Aghadi formed the Bahujan Shramik Samiti and formed a second front. These two fronts mostly fought each other ultimately benefiting the Sena-BJP alliance. In 1996, both came together to form a 'third front', but this effort proved futile.

Results of 1995 and 1996 elections manifest identical patterns. In 1995, the Congress could win only 80 seats with its lowest even percentage of votes (30.7 per cent). The legislative strength of Sena-BJP rose by 44 seats with a marginal rise in votes of less than 3 per cent compared to 1990. More significantly, vote share of the alliance was actually less than that of

Congress in the 1995 election. This could happen because of multi-cornered contests in most constituencies and division of non-BJP, non-Sena votes. Another outstanding feature of election results in 1995 was the election of as many as 50 independent and other candidates, 35 of whom were Congress rebels. This phenomenon clearly expresses the bane of factionalism and lack of party organisation. But more importantly, it confirms the breakdown of Congress in the state.

In the lok sabha elections that followed, the Congress was in no better shape. In its one year in power, the Sena-BJP government had attempted to consolidate its electoral gains and further weaken the Congress. On the one hand the two parties engaged in symbolic actions like changing the names of cities, campaigning against immigrants from Bangladesh, abolishing the state minorities commission, scrapping the commission enquiring into the Mumbai riots of 1992-93 and bringing a bill seeking to ban slaughter of cows. These actions were undertaken to consolidate the 'Hindu' support base. Secondly, the government withdrew cases against caste Hindus from Marathwada – mostly marathas – filed under atrocities act during the anti-namantar riots directed against dalits. This step was clearly aimed at wooing the maratha community which has been disappointed with Congress. The government also took disciplinary action against many sugar co-operatives and co-operative banks; both bastions of Congress. It sought to destabilise Congress hold over local bodies by modifying the relevant act.⁴ In other words, BJP and Shiv Sena tried to strengthen their already secure urban constituency and attempted to penetrate rural areas. By contrast, the Congress remained on the defensive and organisationally very weak after its defeat in 1995. It could win only 15 seats in lok sabha elections – the alliance sharing the remaining 33 (18 to BJP and 15 to Shiv Sena). Compared to 1995, both Congress and the alliance registered an increase in their respective vote shares because the number of rebel candidates was negligible in 1996 and also because the formation of the 'third front' meant less division of votes. Thus, Congress polled 34.7 per cent votes, BJP got 21.1 and Shiv Sena 17.6 per cent votes. In addition, candidates supported by the alliance polled 1.7 per cent votes. The third front received 13.3 per cent votes.

The nature of Congress defeat can be better understood if we undertake regionwise analysis because there are region-specific reasons behind Congress

defeat. In Mumbai and Konkan regions the BJP and Shiv Sena have established almost total domination. Of the 11 lok sabha seats from this region, Sena won six, and BJP four, with the lone seat of Raigad going to Congress (where Antulay won). As mentioned earlier, although Konkan is predominantly rural in nature, it is influenced by politics in Mumbai. Thus, the two regions form a single political unit. The alliance has an incontrovertible grip over Mumbai. Since Mumbai is the most important urban centre, control over this city conveys total hold of the alliance over urban centres all over the state. Several reasons may be cited for the support enjoyed by the alliance in Mumbai. Since its formation in 1966, the Shiv Sena has been strong in the city. During the last decade it attempted to consolidate this base through the hindutva appeal, especially against the backdrop of the Ayodhya controversy. The Sena successfully capitalised the communal polarisation that took place in the city. On the other hand, Muslims held the Congress responsible both for demolition of the Babri masjid and for the inept and allegedly biased handling of the riots. In addition to this communal situation, the BJP's campaign against corruption also drew a favourable response from the urban voter. At a more general level, these factors are applicable to other urban centres, too.

North Maharashtra consists of three districts: Nasik, Dhule and Jalgaon. The former two have a large tribal population with nine assembly constituencies reserved for scheduled tribes. Three lok sabha seats from this region are also reserved for STs. The BJP won three of the reserved assembly seats and three reserved parliamentary seats. Even otherwise, Sena-BJP performance in this region shows that they have made deep inroads in the region. In the lok sabha elections, the BJP won four seats and the Sena secured one from this region. This may be attributed to newly emerging urban centres such as Nasik and Jalgaon and support of major caste groups such as marathas and lewa patils. Consistent efforts of Sangh parivar in tribal areas, too, cannot be ignored in this context.

The BJP consolidated its strength in the Vidarbha region also. In the assembly election, the alliance secured half of the seats from this region. In 1996, the BJP won six out of 11 seats and Sena three, leaving only two seats to the Congress. Right since Vidarbha merged with the rest of the Marathi speaking areas, politics in this region has always been marked by separatist sentiments. The BJP exploited these by demanding statehood for

Vidarbha. Besides, the social composition of Vidarbha is marked by a strong presence of scheduled castes, scheduled tribes and OBCs. This feature gives a prominent role to the kunbi and OBC vote. BJP carefully chose kunbi candidates and projected OBC leaders from the region. On the other hand, tribal, dalit and Muslim vote from the region was divided – the first between BJP and Congress and the latter two between Congress and the other non-Sena-BJP parties resulting in electoral gains for the alliance, particularly the BJP.

Since 1990, the BJP and Shiv Sena have been creating a base in Marathwada region, which is more backward than Vidarbha. This region is dominated by the maratha community. Although there are a number of sugar co-operatives in this region they are not managed efficiently. Maratha leaders of the Congress ran the co-operatives more or less as their feudal possessions. The region witnessed atrocities against dalits by caste Hindus in opposition to the demand and later the decision to name the Marathwada university after Ambedkar. On this background, Sena-BJP alliance has been successful in displacing the Congress by combining popular dissatisfaction and caste/communal polarisation. In the 1995 assembly elections, the Congress vote declined by over 9 per cent and went down to 27.3. The Shiv Sena was the main beneficiary of the Congress debacle; it won 15 seats against 12 of the Congress. The lok sabha elections saw the BJP making further gains by winning four seats – Sena and Congress winning two seats each. Apart from factionalism, Congress defeat has been due to a split in maratha vote and division of dalit and Muslim vote between Congress and non-Sena/BJP parties as in the case of Vidarbha.

It was only in western Maharashtra that Congress could retain some foothold in both 1995 and 1996. In the assembly election, this region witnessed large scale rebellion by Congressmen but the Sena-BJP alliance was so weak in the region at that time that it could not gain from the rebellion. Also, Congress rebels in this region were strong enough to get themselves elected. Thus, in 1995, 18 rebel congressmen won from western Maharashtra. In the lok sabha election, there were less rebellions but the Sena-BJP combine had already managed to create a place for themselves. The BJP won two seats and the Sena bagged one from this region. This suggests that even in this sugar belt, the alliance is making its presence felt. However, maratha support to Congress is more or less secure in this

region probably because even under changing economic conditions dominant agricultural interests have not been hurt. In fact they have benefited from the policies of commercialisation of agriculture. Throughout the period when the Congress faced electoral reverses, western Maharashtra remained behind Congress.

The comprehensive defeat of the Congress can be seen in the light of many factors. The most obvious factor was factionalism within Congress. Factionalism has been a constant feature of Congress organisation not only in Maharashtra but throughout the country. However, during 1995-96, factionalism affected the fate of Congress candidates on a very large scale. There were around 200 rebel Congress candidates in 1995. While 35 of these won, in another 24 constituencies Congress candidates were defeated because of division of votes between rebel and official candidates. In the lok sabha election, factionalism operated on a low key and rather indirectly. In Vidarbha for instance factionalism between Pawar and Naik followers cost the party most of the seats. Infighting affected the prospects of Congress candidates in Jalana, Beed, Nasik, Kopergaon and Satara lok sabha constituencies also. But at a deeper level, this defeat can be understood as having occurred due to the changing basis of state politics in caste terms as well as in terms of material interests.

Another factor contributing to the Congress defeat can be located in the withdrawal of support by the Muslim community. Muslims constitute 9.3 per cent in the state's population. There are around 34 constituencies where Muslim vote is significant in shaping the verdict. Eight Muslim candidates won in 1995. Among these two were from Congress, two from the Janata Dal and one belonged to Shiv Sena. Three candidates won on the ticket of Samajwadi Party. As noted earlier, Muslim vote was divided among the Congress, the Janata Dal and Samajwadi Party. This affected the Congress adversely.

Congress also failed to muster the support of dalit voters. In this case, Sena-BJP alliance was also a claimant for dalit votes. The Republican Party in Maharashtra has always been ridden with factions. Since the rise of Sena-BJP, these factions confronted a new issue: the stand to be taken in order to fight communalism. Unity efforts failed in 1990 because one faction allied with the Congress for fighting communal forces. In 1996, unity among Republican factions was forged by keeping distance both from Congress and BJP-Sena. This confused the traditional

Congress voter among dalits. Besides, there have always been some tensions between Buddhist dalits and Hindu dalits. Sena and BJP exploited this fact and tried to attract the matangs and chambhars in particular. When the alliance came to power, the Sena recruited one minister belonging to chambhar caste and BJP recruited another from matang caste. In 1995 the alliance won 12 out of the 18 seats reserved for SCs in the assembly. There are three lok sabha seats reserved for the SCs. Sena secured two of them in 1996 (one each from Marathwada and Vidarbha).

This development is in a way related to a more general process of shifting political loyalties of major caste groups. As we saw earlier, in Vidarbha and Marathwada, the BJP and Shiv Sena have been successful because they were able to win over sections of important caste groups: kunbis and marathas respectively. Division in maratha vote is by far the most significant development. One analysis suggests that poor marathas deserted Congress because of the latter's inclination to favour only a few rich maratha families [Guru 1995:734]. We discuss this issue in the concluding section. But it is undeniable that marathas of Marathwada, kunbis of Vidarbha and Konkans and large sections of OBCs from Vidarbha chose to vote for Sena-BJP as is evident from voter surveys discussed in the following section.

Another important factor in explaining defeat of Congress is the divide between urban and rural voters. Urban voter has always been less enthusiastic in supporting Congress. Even before Sena-BJP became a force, non-Congress parties fared well in urban areas [Phadke 1982:13-17]. The alliance took advantage of this tendency. It won 63 assembly seats in 1995 from constituencies with an urban or semi-urban character.⁵ With rapid urbanisation – the state has 39 per cent urban population as of 1991 – more and more constituencies are likely to become urban and this promises to be a source of strength for Sena-BJP.

III Resurrection of Congress

In this background the results of 1998 elections to lok sabha came as a surprise. These results seemed to have completely reversed the trends of electoral politics in the state. Apparently, they went against the earlier scenario of decline of the Congress and consolidation of the support base of the BJP-Shiv Sena alliance. However the 1998 election results need not be hastily related to resurrection of the Congress; without taking into consideration the entire dynamics of interplay of interests.

Continuing its efforts to consolidate the support bases in urban centres, the BJP-SS government adopted a package of economic and social policies between 1995 and 1998. Among these the economic policies initiated a positive response to trends of liberalisation. Private sector participation was encouraged in infrastructural development projects. Most significant among these is constructing Mumbai-Pune expressway involving an investment of Rs 1,500 crore. In February 1997 the state government organised a megaconference—Advantage Maharashtra—in order to boost private sector investments and especially to attract multinationals. During the conference, 55 infrastructural development projects estimated to cost around Rs 17,000 crore were invited. The state government asked permission of the centre to set up five export promotion industrial parks. Nine five-star industrial estates were also to be set up in the state.

These policies were mainly to benefit those regions which are considered as traditional support bases of the BJP and Shiv Sena. For example, 33 per cent of the investments in Maharashtra in post-1991 period were in the Konkan region while Vidarbha and Marathwada, which are considered as industrially backward regions, together accounted for only 27 per cent of the investments. Industrial development seemed to be concentrating only in some centres as six districts accounted for 60 per cent of the outstanding investments in the state as of July 1998. Among these, four belonged to the Mumbai-Konkan region. Thus regional disparities continued despite the government's political announcements to end them.

Policies aimed at wooing capitalist interests were balanced by making populist slogans for the urban poor. These included the scheme of providing meals to the poor for minimum charges (Zhunka-Bhakar Yojana), free housing scheme for the slum dwellers of Mumbai, etc. However the government failed to fulfil its promises with respect to these schemes. Charges of corruption in implementation of these schemes were frequently made against the political office bearers, not only by opposition parties but by factions within the ruling combine. The internal relationship between the Sena and the BJP worsened because of these allegations.

The BJP and the Sena also continued their efforts to take over the rural support bases, traditionally belonging to the Congress. They could electorally succeed in their efforts, at least partially, as is evident from the results of the elections

to rural and urban local bodies held in 1997. The Congress had won 1,202 seats of the total elected seats in district councils (zilla parishads) in the 1992 elections. In 1997 it could manage to win only 807. In the block development councils alone the Congress had earlier held 2,158 seats while in 1997 it could win only 1,204. In municipal council elections (mainly the semi-urban centres) the BJP-SS combine had a vote share of 22 per cent.

The combine worked desperately to destabilise the Congress support base in rural Maharashtra. Strict disciplinary actions against the sugar co-operatives, which are mainly managed by Congress leaders, prompted some of the influential sugar barons to cross over to the BJP-Shiv Sena for political benefits. On the other hand the state government totally neglected the demands of farmers growing cash crops like cotton and sugarcane. Thus in rural parts also the rich seemed to be aligning with the combine while the poor sections experienced total dissatisfaction. In addition to this, practices of corruption increased significantly at all levels of the government machinery during this period. The anti-corruption campaign initiated by Anna Hazare, a social worker, in December 1997 received tremendous response in rural areas.

The political process during 1996-98 was complex. Conditions led to increasing popular dissent against the state government in both urban and rural areas. However popular dissent always remained fragmented, unorganised in nature. The fragmentation arose mainly because of the nature of political economy during the post-liberalisation period. The BJP-SS combine responded to the situation in a very aggressive manner and shaped capitalist development in a very crude way. These strategies brought forth the malignant face of the ruling alliance in terms of explicit material domination. Both urban and rural interests were affected by these strategies.

The electoral process for the 1998 lok sabha elections took place on this background. It was obvious that the electoral contestations would mainly take place between the BJP-SS combine and the Congress as the third force had become almost non-existent.

The first positive sign for the Congress appeared when Sharad Pawar successfully managed to enter into an alliance with a united RPI and the Samajwadi Party. It was mainly because of this alliance that the Congress could register an impressive victory in the elections. Congress leaders were busy making these alliances till the

last moment. Thus there was no issue-based campaign against the ruling parties. It mainly relied on Sonia Gandhi's public meetings for effective campaigning. Thackeray's speeches also mainly targeted Sonia Gandhi. The BJP relied largely on Vajpayee's image. Both the parties were unable to lead any issue-based campaign as most of their populist strategies had failed. The Congress organisation had become so weak that it could not take advantage of this situation on its own.

The Congress, along with its allies, could still manage to reverse the trends of electoral politics during these elections. The Congress and its allies won 37 out of 48 seats. Among these, 33 seats were managed by the Congress itself, while four seats were won by the RPI. (It is important to note that none of these four constituencies were reserved for the SC.) The BJP-Shiv Sena combine could win only 10 seats (four to BJP and six to Shiv Sena), while the remaining seat (Alibaug from Konkan) was won by the PWP. The percentage of votes rose from 34.2 to 43.085 for the Congress. Though the BJP-SS lost in the seat tally they could slightly improve their vote percentage (42.4). In 1996, these two parties had received 40.4 per cent votes. It was the electoral alliance with the RPI and the SP which helped the Congress. It helped mainly in avoiding the division of anti-BJP-SS vote.

Regionwise analysis of the election results shows that the BJP and the Shiv Sena could win seats mainly from the Mumbai-Konkan region. Out of 11 seats from the region, Congress gained three; Shiv Sena gained five and one went to the BJP. This region had traditionally supported the BJP-SS because of its dependence on the Mumbai metropolitan region. However, the most surprising results came from Mumbai, where one of the RPI candidates defeated a Shiv Sena candidate from an unreserved constituency which is considered to be Sena's stronghold. In two other constituencies of Mumbai, the Samajwadi Party candidates lost by a slender margin to Shiv Sena; mainly due to presence of a Janata Dal candidate. These results in Mumbai might be related to growing popular dissatisfaction with the government, though this explanation might not be sufficient for other parts of the state.

During both the 1995 and 1996 elections the Shiv Sena and the BJP had been able to draw large support from Vidarbha and Marathwada regions. However, in 1998, the Congress swept these two regions. It won six out of eight seats in Marathwada while the remaining two went in favour

of the BJP. In Vidarbha the BJP-SS could not get a single seat. Among the 11 seats in Vidarbha, the Congress won eight while the RPI won three. It proved to be the most significant aspect of the elections in Vidarbha. Dalits have a sizeable numerical and political presence in Vidarbha. However dalit candidates cannot win assembly or lok sabha elections without the active support of the upper castes especially the kunbis. As stated earlier, kunbis and marathas in general and specifically in Vidarbha have always had antagonistic relations with dalits.

Given this election results in Vidarbha need to be analysed very carefully. It is a fact that the marathas and kunbis did vote for RPI candidates. However it would be risky to relate their act to a progressive change in their political attitudes in order to consolidate forces against the BJP-SS combine. A more plausible explanation of their act can be related to the forthcoming assembly elections in 2000, in which these social sections need the support of dalits to get elected. Congress strategy to avoid division of votes also helped the RPI candidates. A similar situation was witnessed in north Maharashtra region, where earlier the BJP had quickly entered the traditionally Congress support base. In 1998 elections, however, the Congress restricted the BJP to only one seat among the six from the region. Sonia Gandhi's public meetings received tremendous response in the tribal belt of this region.

The BJP and the Sena engaged themselves in desperate attempts to make a dent in western Maharashtra. In response to their efforts, some of the influential Congress leaders from the region had crossed over to the BJP-Sena fold. Still, the Shiv Sena could win only one seat out of 12 from the region. All remaining seats were won by the Congress.

The most significant factor contributing to the Congress victory was its alliance with the RPI and the Samajwadi Party which helped in bringing together dalits, Muslims and to some extent the OBCs. In the 1995-96 elections, Muslims had distanced themselves from the Congress (mainly because of the events of 1992) and chosen to vote for a Muslim candidate belonging to any party. In the 1998 elections, the Muslims rallied behind the Congress mainly because of the anti-Muslim policies adopted by the state government. This convergence of interests of three crucial social sections helped Congress victory.

These explanations, however, do not prove sufficient to label the 1998 election results as expressions of popular dis-

satisfaction, diminishing support for the BJP-Sena or resurrection of the Congress. Cracks started appearing between the RPI and the Congress immediately after the elections. As stated earlier, the OBC and the maratha sections voted for the RPI candidates keeping an eye on the assembly elections rather than to support the weaker sections in the realm of material interests.

IV Voting Patterns

In the 1990s, the Shiv Sena and BJP emerged as the main electoral forces. This remains true in spite of the Congress victory in 1998 elections. Growing influence of the BJP-SS is evident not only through election results; it is evident from political preferences of voters expressed in the course of voter surveys in 1995-96 and in 1998. It appears that defeat of the Congress in 1995-96 was not a temporary phenomenon. On the other hand the Congress victory in 1998 elections did not show decline of the support base of the BJP-SS. Sections of voters have steadily moved away from the Congress. It is possible to identify these sections with the help of survey data. It seems that while Congress is losing its traditional support base, Sena-BJP have created a specific constituency for themselves. The Congress could not win back this constituency even during the 1998 elections.

The Congress could win a large number of seats in 1998 elections. However the seat-gain was not exactly congruent with the support extended by various social groups. It was claimed that the Congress could win these elections mainly because of the shifting loyalties of the maratha and OBC groups. But the 1998 survey data clearly shows that these social sections still largely support the BJP-Shiv Sena combine in the state, as we shall see below.

Thirty-five per cent respondents reported to have voted for Congress in the 1996 lok sabha election. Almost an equal numbers reported that they voted for BJP-Sena alliance (13 per cent for BJP, 22.5 per cent for Shiv Sena). Although both the political forces enjoy equal support it needs to be kept in mind that Congress support is declining and support to the latter is growing. In comparison to 1995, Congress support in 1996 has gone down by about three per cent while support to the alliance increased by almost 10 per cent [Palshikar 1996a: 174-78]. Besides, the Congress base is shallow as compared to Sena-BJP in more than one senses. Only 18 per cent respondents identified Congress as a party likely to solve their problems as against 26 per cent who identified either Sena or

BJP or both in this regard (6 per cent-Sena, 17 per cent BJP and 3 per cent both). Eighteen per cent respondents said they felt close to Congress while 22 per cent felt close to the alliance (11 per cent to BJP, 9 per cent to Shiv Sena and 1.5 per cent to both). These findings confirm the trend noted in the 1995 survey that much of Congress support is unreliable while support to alliance seems more conscious [Palshikar 1996a: 175]. The findings also suggest that BJP and Shiv Sena have no option but to continue the alliance because they share the newly formed anti-Congress constituency. In terms of numbers, BJP is ahead of Shiv Sena but it is as yet in no position to challenge the Congress on its own. In fact both BJP and Shiv Sena would be insignificant in the absence of an alliance. But the data and election results also show the ability of these two parties to transfer their respective votes to each other, without which their electoral victories would have been impossible. More importantly, success in transferring their voters implies the existence of a common constituency. Therefore, the real finding of surveys in 1995 and 1996 is that in Maharashtra there has emerged a constituency favourably disposed to politics of hindutva and to an urban oriented politics. This disposition gets combined with anti-Congress sentiments producing electoral reverses for the Congress.

Support base of the alliance can be identified in terms of young age, school/college education, urban residence and a split in certain caste groups. As shown in Table 2 the age factor is not very strongly associated to party support if considered in isolation. But as we shall see below, the age factor becomes relevant when considered along with caste. In overall terms, support for Congress and Shiv Sena is more evenly distributed among different age groups than is the case for BJP. It has weak support among the age group of 46 to 55 years. But this is compensated by slightly stronger support to Shiv Sena in the same age group. Support to BJP and Shiv Sena is higher among young voters. More than half of the supporters of both parties are below 35 years of age while more than half of Congress supporters are above 35

TABLE 2: AGE AND PARTY PREFERENCE BY AGE
(Per Cent)

Age (Year)	Congress	BJP	Shiv Sena
Up to 25	31.4	15.5	21.6
26-35	34.9	12.1	25.0
36-45	39.8	15.2	18.7
46-55	33.3	8.5	25.6
> 56	36.7	11.6	21.8

years of age. In this sense, BJP-Sena draw their support mainly from the young.

Party preference is more strongly associated with education. Support to Congress and Shiv Sena among different educational groups shows a secular trend which is not so clear in case of BJP voters. On the whole, BJP has more support among the 'well educated' – those who attained higher secondary or college education or above. In case of both Congress and Shiv Sena, number of supporters goes down among voters with higher education (Table 3). Thus, only one-fourth of BJP voters are educated up to middle school while 38 per cent of Sena voters belong to this group. Among those who identified BJP as a party likely to solve problems 51 per cent have studied up to college level and among those who thus identify Shiv Sena almost 50 per cent are college educated. These findings can be further appreciated in the light of occupation and residence. Almost half of BJP supporters come from middle occupational groups and another 21 per cent belong to high occupations making the BJP a party of the middle class. For the Shiv Sena 38 per cent of its supporters come from middle occupation groups and 26.3 per cent from high occupations. But in addition to this 19 per cent Sena followers belong to low occupations, thus making Sena following more complex than the BJP's. Support among well educated and middle occupation groups implies urban nature of the support base. This is borne out by survey data. While less than one-fourth of Congress votes are from urban areas, BJP and Shiv Sena have one-third of their supporters from urban areas and two-thirds from rural areas. The Congress has never been very popular in urban areas. As such, lack of support for Congress among urban voters is not very surprising. However, Sharad Pawar was assiduously cultivating urban-based material interests since 1988-89. In the light of these efforts, his failure to garner support from urban voters becomes noteworthy. This failure might be attributed to two factors. Firstly, as mentioned earlier, the strategies adopted by Pawar since 1989-90 smacked of obvious manipulation and as such did not cut ice with any segment of the voters. Secondly, the Congress has traditionally been seen by urban voters as a party of rural interests, therefore urban voters preferred to stay with BJP-Shiv Sena alliance which has an urban identity.

While BJP and Shiv Sena thus retained their urban constituency, election results and survey data indicate that the alliance

is all set to make a dent in the rural areas as well (Table 3).

Survey data show that support to Congress is slightly higher among women than among men: almost 38 per cent women and 32.4 per cent men support Congress. Similarly, Shiv Sena support too, is evenly distributed across gender: 22.5 per cent men and 22.6 per cent women. But BJP support has a gender imbalance. While only 10 per cent women support BJP, 15.8 per cent men support it. As a result, men-women ratio of BJP supporters is 60:40 and for Sena it is 49:51. The same is 45:55 for Congress supporters.

We have already mentioned the alienation of Muslim voters from the Congress. In 1995, 50 per cent Muslim voters expressed inclination towards the Congress and 5.7 per cent to the BJP. In the 1996 survey 56 per cent Muslim voters favoured Congress and 12.8 per cent sided with Samajwadi Party, while BJP and Shiv Sena together received support from just 2.7 per cent Muslims. This means that the alliance was not able to win confidence of the Muslims after it came to power. Data suggest that Samajwadi Party in Maharashtra has become almost exclusively a Muslim party (70 per cent of its voters are Muslims). What does this mean for the political effectivity of Muslim community in the state? Strength of the Muslim community in the state being modest, the community is not likely to be effective on its own – even if all Muslims were to vote for the same party – unless they ally with some other forces. The Samajwadi Party not only alienated sections of the community from the Congress but also marginalised it in state politics [Palshikar 1996a: 178], the ultimate advantage going to Sena-BJP alliance. Although the Congress continues to win support from over 50 per cent Muslim voters, there is reason to believe that the support enjoyed by Samajwadi Party is of strategic importance although numerically small (12.8 per cent). Constituencies having sizeable Muslim vote have returned non-Congress MPs. This could happen only because in these constituencies Muslims did not vote for Congress but preferred the Samajwadi Party (or in some cases Janata Dal). This factor was responsible for Congress defeat in four constituencies (south Mumbai, south-central Mumbai, north-western Mumbai, Dahanu). Besides, Congress also lost in Aurangabad and Malegaon due to division of Muslim vote. Our survey clearly shows that the alliance has been successful in winning over support of major caste groups who earlier supported the Congress. Thus, Congress

gets support from around 38 per cent marathas while the alliance is supported by over 40 per cent maratha voters. A similar pattern can be observed in case of Kunbi and other OBC voters. Table 5 shows that major caste groups share loyalties more strongly with Sena-BJP than with Congress. Among those respondents who feel that Shiv Sena cares for their interests, 55 per cent are marathas and 22 per cent are OBCs. Similarly, among those who believe that Shiv Sena will solve the problems 36 per cent are marathas and 40 per cent are OBCs. Interestingly, 29 per cent marathas, 32 per cent kunbis and 27 per cent OBCs support the demolition of Babri masjid. Castewise distribution of party supporters further confirms the trend towards split in different caste groups (Table 5).

Both BJP and Shiv Sena have claimed large share of rural OBC and maratha

TABLE 3: PARTY PREFERENCE BY EDUCATION AND RESIDENCE

	(Per Cent)		
	Congress	BJP	Shiv Sena
Level of Education			
Illiterate	37.5	11.3	26.8
Up to middle school	36.3	9.0	24.3
Higher secondary/college	34.3	17.6	25.8
Graduate and above	22.4	24.5	14.3
Residence			
Urban	27.3	14.2	22.0
Rural	38.6	12.4	23.8

Note: (i) Figures indicate percentages. Row percentages do not add to 100 because support to other parties is not shown.
(ii) n = 861.

TABLE 4: PARTY PREFERENCE BY CASTE (Per Cent)

Caste Group	Congress	BJP	Shiv Sena
SC	27.7	8.33	8.33
ST	37.2	18.5	3.7
maratha	37.8	4.3	36.0
Kunbi	26.0	13.8	34.1
OBC (excluding kunbi)	37.2	15.6	25.5
Other	38.2	16.1	12.0

Note: Row percentages do not tally up to 100 since other parties are not included in the table.

TABLE 5: CASTE COMPOSITION OF PARTY SUPPORTERS

	(Per Cent)			
Caste Group	Congress	BJP	Shiv Sena	Share in Sample
SC	6.6	5.4	3.0	8.4 (n=72)
ST	6.6	9.0	1.0	6.3 (n=54)
Maratha	20.5	6.3	30.4	19.0 (n=164)
Kunbi	10.6	15.3	21.6	14.3 (n=123)
OBCs (non-kunbi)	28.4	32.4	30.4	26.8 (n=213)
Other	27.4	31.5	13.4	25.2 (n=217)

votes. Among rural OBCs 42 per cent voted for Congress and 20 and 22 per cent for BJP and Shiv Sena respectively. Among rural marathas 42 per cent supported the Congress and over 38 per cent supported the alliance (BJP sharing only 1.6 per cent). Congress received support from a little over 26 per cent rural kunbis, BJP was supported by 14 per cent and Sena 34 per cent. Thus 35 per cent of Sena's rural votes come from marathas while 38 per cent of BJP's rural votes come from OBCs. In addition to this, the Congress loses significant sections of maratha and OBC votes in urban areas. Less than one-fourth urban maratha voters support the Congress while over 46 per cent support the alliance (34 per cent Sena and 12 per cent BJP). Twenty-nine per cent urban OBCs vote for Congress and 42 per cent vote for the alliance (9.3 for BJP and 32.6 for Sena). These details suggest, among other things, that the BJP has a stronger support among OBCs in rural areas while Sena enjoys the support of OBCs in urban areas. Problems for the Congress are further confounded by the fact that younger elements from different castes are not supporting it. In concrete terms, only one-fourth maratha voters below 25 years of age support Congress (40 per cent support the alliance); and 35 per cent voters below the age of 25 support Congress (15.5 per cent and 31 per cent support BJP and Sena respectively).

Results of survey help in characterising the emerging support base for the BJP-Sena alliance in the state. It emerges mainly from the educated, urban voters of young age. Apart from the upper caste support to BJP, kunbis and OBCs are also supporting the party. Shiv Sena, on the other hand, is gaining support of the marathas and OBCs. The alliance has successfully intervened in the maratha and OBC constituencies. The data poses a question regarding the interaction of caste and urban location. From the declining support to Congress among urban marathas and OBCs, we can surmise that urban location proves to be crucial in formation of political preferences. Another crucial fact that the survey results highlight concerns OBC politics in the state. With emergence of OBCs as a sizeable support group for Sena-BJP, prospects of 'OBC' - Bahujanwadi politics are likely to be jeopardised.

The voter survey data for 1998 elections does not contradict the above mentioned trends. The earlier surveys had identified the support base of the alliance as mainly coming from urban, middle class, male youth engaged in middle and high occupations. During 1998 elections also,

these groups seemed to be largely supporting the alliance. More than half Shiv Sena supporters are below the age of 35 years. In fact voters below 35 years of age seemed to equally supporting both the Congress (43.3) and the BJP-SS (46.4). Genderwise Congress seemed to be in a somewhat better position as 51 per cent of the women have supported it; while in the case of the combine the percentage is only 37.5. More than half of the Congress voters are women while among BJP voters only 37 per cent are women.

Among the voters educated up to college level, 58.2 per cent support the BJP-SS alliance while 32.7 per cent have voted for the Congress. Among those who have studied up to graduation 47.8 per cent voted for the Congress while 50 per cent voted for the BJP-SS. Among the BJP voters more than half are educated above the middle school level while in case of the Congress the percentage is only 33. Among the occupational categories also, the Congress and the BJP-SS seemed to enjoy equal support. Among those engaged in white collar jobs and professions 51 per cent supported the Congress and 45.8 per cent supported the BJP-SS. Almost similar are the percentages for those engaged in business (51.6 for Congress and 43.0 for BJP-SS).

As stated earlier, during the 1998 elections Congress could gain support of a large number of Muslims. The survey data shows a clear shift of Muslim votes in favour of the Congress. Among the total number of Muslim voters surveyed 78.4 per cent claimed that they have voted for the Congress. This is the only social group which clearly shifted its loyalties towards Congress. Otherwise the BJP-Shiv Sena seemed to have kept their support base intact.

Voting behaviour of the caste groups can be considered as a very significant case in point to support our earlier argument regarding alliance of the social sections. Of the OBC voters, 48.8 per cent have supported the BJP-SS (19.2 per cent for

the BJP and 29.6 per cent for Shiv Sena) while only 34 per cent have voted for the Congress. Among the upper castes also 57 per cent seemed to be supporting the Congress while 49 per cent supported the BJP-SS combine. Among the total member of voters for the BJP-SS more than half belonged to the OBC castes. On the other hand only 32.4 per cent of the total Congress voters were from these sections.

How does this changing scenario of politics affect caste composition of MLAs and MPs? A split in maratha vote and strong OBC support to Sena-BJP alliance suggest the possibility of changes in numerical equations. We review the nature of changes below.

Marathas as members of a numerically and politically dominant caste group, have always been elected in large numbers to the legislature. It is often argued that marathas enjoy disproportionately large share in power. Power is shared to some extent by upper and intermediate castes as well as non-Maharashtrians who are usually from influential groups in their own states. Although some OBC castes such as mali, dhanagar, vanjari and teli are influential in parts of the state, Maharashtra cannot have strong OBC politics because these castes are dispersed in different regions of the state. After 1990, as an effect of 'Mandalisation' of politics, every party attempted to win over OBC support by organising the OBCs and giving more tickets to OBC candidates [Kulkarni 1991: 126-30]. While Shiv Sena was successful in mobilising urban OBCs, the Bahujan Mahasangha was established in early 1993. As mentioned earlier, the BJP, too, was not lagging in this attempt to build an OBC constituency.

Tables 6 and 7 show the caste composition of MLAs (1995) and MPs (1996 and 1998) respectively. It may seem that no significant change in caste composition of representatives has taken place. Traditionally, marathas get around 40 per cent seats in the assembly and OBCs are elected to about 5 to 6 per cent seats [Thite 1996].

TABLE 6: MLAs BY PARTY AND CASTE, 1995

	Congress	Rebel	BJP	SS	JD	PWP	Others	Total
Upper	2	-	5	5	-	-	-	12
Middle*	5	2	6	3	2	-	1	19
Maratha	41	22	11	33	5	3	-	115
Kunbi	5	1	7	7	-	-	3	23
OBC	12	3	9	11	2	3	5	45
SC	3	2	8	5	-	-	1	19
ST	7	4	6	3	-	-	3	23
Muslim	2	-	-	1	2	-	3	8
Non-Marathi	3	1	13	2	-	-	2	21
Not known	-	-	-	3	-	-	-	3

Note: *includes intermediate castes like gujar, lingayat, komti, etc.

In this background, in 1995 maratha-kunbi group accounted for 138 seats and 45 seats went to OBCs. In the lok sabha election of 1996 (the maratha-kunbi MPs account for 22 seats with just three OBC MPs. Thus the numerical strength of respective caste groups has remained the same but their party affiliation changed. In 1990, Sena had 24 maratha MLAs. This number rose to 33 in 1995. For the assembly election in 1995, the Shiv Sena nominated 91 maratha-kunbi candidates. The BJP, on the other hand, attempted to gain advantage by fielding OBC candidates. Among its 117 candidates in 1995, 34 were marathas and 44 were OBCs. The number of OBC representatives did not rise but the Sena-BJP alliance emerged with 20 OBC MLAs out of a total of 45. In the 1996 lok sabha elections, 16 candidates of the alliance were marathas, eight were kunbis and five were OBCs. Among the Congress candidates, 16 were marathas; while three were kunbis and six OBCs. For the 1998 election, Congress fielded 18 maratha candidates and two kunbi and 14 OBC candidates. The BJP-Sena alliance, too, fielded 16 maratha candidates, seven kunbi and six OBC candidates. We have excluded the scheduled castes and scheduled tribes from this discussion because they hardly get representation except from reserved constituencies. The 1998 elections proved to be exceptional in this respect. The RPI could manage to win four seats with Congress support. One more SC candidate, from the Congress, won from the Solapur unreserved seat.

It can be argued that the share of different caste groups in political representation remains unaffected even after the emergence of the Sena-BJP alliance. However, some change has occurred as far as composition of the state ministry is concerned. In the late 1970s, maratha kunbi ministers accounted for over 60 per cent of the council of ministers. In the 1980s, the share of maratha-kunbi ministers reached an all-time low of 42 per cent. This benefited the non-Marathi and SC, ST sections. When Pawar returned as chief minister in 1988, he increased the share of OBC ministers keeping in mind the awakening among these sections. Yet, maratha-kunbi ministers retained a share of over 52 per cent in the ministry. In Pawar's ministry in 1993, seven members were OBCs out of a total of 42. Two things become clear from this. Firstly, except in 1980-81, share of marathas never went below 52 per cent. Secondly, share of OBCs rose in the late 1980s, reaching the highest in 1993. Against this background, the Sena-BJP ministry strikes a contrast

because it reduced the maratha-kunbi component without increasing the share of OBCs in the ministry. In the Manohar Joshi ministry, maratha-Kunbis account for only 41.5 per cent and OBCs account for a little over 12 per cent. The real benefit goes to the upper castes since after 1995, the share of upper-literate castes went up to almost 15 per cent: as many as six ministers in a total of 41. This implies a change in the internal relationship between maratha-kunbis and upper castes, without benefiting the OBCs. We shall discuss the political significance of this development in the concluding section.

V

Conclusion

The foregoing discussion highlights two significant trends regarding electoral politics in the state. One is that the caste basis of politics is changing and the other is the emergence of urban centres as the new locus of electoral politics.

Traditionally the maratha-kunbi caste group constituted the bulwark of support for Congress. Other backward castes, too, extended support to Congress. Election results in the 1990s as well as our surveys show that both these caste groups now stand divided. Large sections of marathas and kunbis now identify themselves either with Shiv Sena or the BJP. This is particularly true of marathas from Marathwada and kunbis of Vidarbha. OBCs are also divided among different parties and support for BJP or Shiv Sena is significantly high among them. A section of marathas had been opposed to the Mandal recommendations and to the 'namantar' (renaming) of Marathwada University. Maratha Mahasangh had publicly held this position.⁶ The pro-OBC, pro-dalit stance advertised during Pawar's tenure hurt the caste pride of conservative sections among the marathas. These same sections were also doubtful about the policy of liberalisation and industrial penetration in rural areas. While maratha leaders were engaged in retaining their hold over power

structure, ordinary maratha peasantry never benefited much in terms of material advancement. These developments contributed to a split in the maratha-kunbi electorate. BJP and Sena could appropriate support from maratha-kunbis both because politics of hindutva gave a message of assurance to the conservatively inclined sections and the oppositional location of these parties attracted those who did not benefit under Congress rule.⁷

Dispersal of OBC vote was much more easy. In the absence of a separate political consciousness as OBCs, and in the absence of an alternative political vehicle, they traditionally voted for Congress. But the Congress failed to accommodate political aspirations of the new generation of activists from these castes. Thus, OBCs, who were peripheral in the Congress scheme were not likely to lose much if they deserted the Congress. Since neither Shiv Sena nor the BJP had maratha leadership, the OBCs were easily attracted to these parties.

The 1990s witnessed emergence of urban sector as the new focus of political power. This trend has earlier been noted by Vora (1996). Till 1990, political power in the state was controlled by politicians coming from a rural background. Since 1995-96, role of urban and semi-urban constituencies has become crucial. As noted by Vora (1996: 172), the BJP-Shiv Sena alliance won 63 of the urban/semi-urban constituencies. In this way these constituencies have played an important role in displacing the Congress. The influence of urban areas extends to adjoining rural areas also. We have already mentioned how Mumbai influences Konkan. A similar process is at work in the case of areas adjoining Pune, Nasik, Aurangabad and many other district headquarters. As many as 33 seats won by Sena-BJP in 1995 fall under such influence of urban centres. Besides, there is a strong unity of urban vote. BJP and Shiv Sena appear to be virtually monopolising urban political space. While politics is becoming more competitive in rural areas, it is marked by low levels

TABLE 7: MPs BY PARTY AND CASTE, 1996 AND 1998

	Congress	BJP	Shiv Sena	Other	Total
Upper	-(1)	2(1)	5(3)	-	7(5)
Intermediate	2(3)	-(0)	1(-)	-	3(3)

Note: Figures in parentheses refer to 1998 lok sabha elections.

competitiveness in urban area. Defeat of the Congress, thus, results from a combination of fragmentation of rural vote and consolidation of urban vote. This peculiar combination gives the urban areas more leverage vis-a-vis the rural areas; politics becomes more focused on urban interests.

Urban interests, however, continue to be internally contradictory. The ideology of hindutva plays a significant role in bringing the disparate and often conflicting urban interests together to manufacture a political victory. At the same time, the ideology of hindutva created its own constituency in the rural areas by capitalising on the anti-dalit sentiments among sections of maratha and OBC voters. The new political setup that has emerged consists of a rearrangement of dominant interests. This rearrangement requires a common meeting ground for urban and rural electorates. It is also necessary that this new politics evinces an ideological purpose. The ideology of hindutva seeks to bridge the gap between the urban voter and rural voter. Hindutva is appropriated both as homogenising and hegemonising strategy.

Let us summarise the broad characteristics emerging from the electoral process during the 1990s. Decline of Congress has been evident throughout this period. Apart from electoral reverses, this decline is characterised more by the inability to hold a broad social coalition together and the inability to allow even a symbolic representation of popular wishes. In this regard developments in Maharashtra are not very different from the all-India scene [Palshikar 1996b]. Electorally, the Congress in Maharashtra has been unable to mobilise new sections of voters (youth, tribals, etc). It has also been unable to curb factionalism. Voter loyalty to the party is weak and uncertain, [Palshikar 1996a: 174-75]. This aspect of Congress decline, too, is comparable to its plight elsewhere [Yadav 1996: 100-01]. What distinguishes the political future of the Congress in Maharashtra from that in other states is that no other party is singly capable of competing with the Congress. The BJP and Shiv Sena could displace Congress only by forming an alliance. Should the alliance split, there is no serious contender to the Congress.

On the contrary, as the results of 1998 elections suggest, if the Congress consolidates its position only marginally, the political advantage gained by BJP and Shiv Sena will be easily lost. In this respect it may also be noted that even after losing the assembly elections in 1995, the local level networks and control of sugar co-

operatives were retained by the Congress. The large number of Congress 'rebels' have generally desisted from joining either BJP or Shiv Sena. Their 'independent' existence speaks volumes for the potential of the Congress.

However, the Congress now finds it difficult to identify with either the maratha-kunbi caste group or with agrarian interests. Both its national leadership and Sharad Pawar at the state level have allied very strongly with capitalist interests. This creates a double handicap. On the one hand, this identification alienates the party from rural (both maratha and OBC) population. On the other hand, the present ideological positioning of the party restricts its mobilisational ability. As a party wedded to capitalist development, the Congress cannot effectively mobilise popular dissent. Since 1995, the Congress in Maharashtra could not effectively organise any oppositional movement because of this ideological handicap.

The second characteristic emerging from contemporary electoral politics is the restructuring of the caste alliance in the state. We have already noted that there has been a split in the votes of maratha-kunbi as well as OBCs. Apart from this division of votes, internal relationship among various caste groups has been changing. The success of Congress stemmed from its ability to retain a complex alliance of castes. In this arrangement, political initiative and formal power were vested with the maratha-kunbi caste group. While this excluded the brahmins from formal power, material interests of the brahmins were not hurt. In this sense, they continued to enjoy a secondary share in power. Political power of the marathas gained legitimacy in the name of 'bahujan samaj', which extended political support to the existing power structure without much share in it. While the role of OBCs has not altered during the 1990s, the internal relationship between marathas and brahmins has changed. In the new arrangement upper castes, which are also urban castes, have emerged as politically powerful castes. Brahmins and prabhus along with trading castes, have earned a decisive role in the formal power of the state, displacing the marathas [Vora 1996: 172-73]. The marathas now provide numerical strength required by the dominant but numerically weak powerholders. On account of its brahmin supremacy, the present caste alliance may be appropriately designated as the 'Hindu' alliance.

This trend is in contrast to the 'most significant trend of rise of OBCs to political power in north India' [Yadav 1996: 102].

The OBCs in Maharashtra still find themselves in a politically weak situation. The Bahujan Mahasangha, formed in 1993, sought to alter the terms of political contest by forging an alliance of OBCs and dalits. It could not rise to a commanding position electorally. But more than the failure of Bahujan Mahasangha, the real setback consists of emergence of 'Hindu' alliance resembling the varnic hierarchy. Interestingly, this change in the caste alliance has taken place without altering the traditional caste composition of the state legislature. As noted earlier, the maratha-kunbi caste group still commands a majority in the legislature. The number of brahmin-prabhu MLAs has not increased radically and yet they have been placed in a commanding position. An explanation of this peculiar situation takes us to the third and probably the most important characteristic of state politics emerging during the 1990s.

We have already mentioned earlier that since the 1980s, the relationship among sections of entrenched interests was undergoing a change. This change has crystallised during the 1990s. The arrangement visualised by Y B Chavan consisted of a sharing of material domination by landed interests and industrial interests. Within this framework of sharing, competition took place between the two. During the 1980s, the terms of competition were sought to be redefined. The emergence of the service sector as the major sector played a major role in this context. Even in the rural economy service sector made a dent. This trend became visible in the 1990s – the emergence of transport, trading, tourism, hotel industry and contract labour marked this trend. This development expanded the numerical base of non-agrarian interests. Once the terms of competition among entrenched interests went beyond sharing of domination, the utility of Congress as mediator of political legitimation eroded. The new formation of urban-centred industry-service alliance sought a new political framework. In this new political framework, the numerical role of rural representatives could not be avoided but decisive control over the political apparatus was entrusted to urban, upper caste sections of the political leadership. This is evident from composition of the ministry as well as distribution of portfolios and priorities in policy-making.

This is not to suggest that policies of a Congress government would have been radically different. In fact, Pawar was enthusiastically pursuing most of the policies taken up by the BJP-Sena govern-

ment. But in his case, there was a major political constraint in that his constituency was essentially rural. From 1960 onwards, a disjunction was growing under Congress rule between political domination and material domination. It became acute after the growth of the service sector and the onset of new economic policies. Emergence of the BJP and Shiv Sena indicates that this disjunction has been overcome at least temporarily. Both BJP and Sena are essentially urban parties. Although both are now expanding to rural areas, their leadership continues to be urban. Both parties enjoy the support of urban, educated persons and those belonging to moderate occupations. Both parties rely on emotional appeals and flash mobilisation rather than sustained mass agitations. This phenomenon is in consonance with the nature of urban politics. With strong support of an urban constituency, BJP and Sena are not constrained by rural concerns. On the other hand, disintegration of Congress and non-existence of 'third' alternative mean that the alliance can dictate its own political terms. Thus, emergence of BJP-Sena alliance marks an end to the disjunction between political and material domination. The present dispensation symbolises unity of these two modes of domination.

Because of this development, politics in the state fails to take a radical direction in spite of the fact that the earlier dominant alliance has been upset by the electoral process. This situation raises an interesting point. On the face of it, there appears to have emerged a competitive party system in Maharashtra. But while the arena of politics becomes more 'competitive' in electoral terms, absorption/moderation of popular dissatisfaction is also ensured in this situation. Does this mean that in a competitive party system, ruling classes are capable of routinising the energies generated by popular dissatisfaction? On the one hand, absence of competitive political arena implies a very narrow space for popular resistance; while competitive politics as has emerged in Maharashtra, is likely to produce only illusory space since it does not allow popular dissatisfaction to take a radical shape.

This means a more aggressive role of urban interests. It also implies that the space for radical political exercise will shrink further. In the absence of such space electoral politics loses its democratising content. In this sense, Maharashtra is witnessing the misappropriation of democratic expression by the expression of domination.

Postscript: With the move by Sharad Pawar to search for a new script of politics, it is only natural that his politics should force a postscript to the foregoing analysis of Maharashtra politics. Following his departure from the Congress, 45 of the 77 Congress MLAs have declared their support to the Nationalist Congress Party (NCP). Also, five independent ministers have resigned and joined the NCP. Pawar has received support from a majority of sugar co-operatives in the state. Except Vidarbha region, district and local level Congress units have split vertically. With this Pawar has achieved three things: (i) He is in command of resource-rich sugar co-operatives; (ii) He has received considerable support from Congress rank and file; and (iii) He has the support of majority of Congress leaders from Maharashtra. Thus, the NCP has quickly acquired centre stage in the state politics and 'Third Force' parties have shown willingness to enter into electoral alliance with Pawar. The Ramdas Athavale faction of the RPI has declared its intention to ally with Pawar.

The appeal that Pawar uses is a complex one. He is adroitly mixing the issue of regional pride with that of maratha pride. It is hoped that this will bring together the faction-ridden maratha caste. At the same time, Pawar is also trying to project an OBC friendly image. Thirdly, Pawar aims to receive the support of dalits and Muslims. However, this can be achieved only through electoral alliances with the RPI and the Samajwadi Party. One thing that appears to be near certain is that the NCP will cut at the root of Shiv Sena's support outside Mumbai. In terms of electoral competition, the rise of the NCP has introduced a more competitive element into state politics. Elections all over the state will now be more keenly fought. The near extinct 'Third Force' will gain temporary respite. This additional competitiveness would mean that the OBCs, the dalits and Muslims can now enhance their bargaining power. These sections can ask for a greater share in power. However, the NCP seems to be very cautious and hesitant in identifying itself with the OBCs, the dalits and Muslims. Its overdependence on the maratha caste group and the semi-feudal sugar bosses will not allow the NCP to substantially change the dominant equation in Maharashtra. In this sense, Pawar's NCP promises to make the state politics more competitive, complex and interesting. To 'Third Force', on the other hand, the NCP does not appear to be providing greater space for an alternative script of politics in the state.

Notes

[The authors wish to acknowledge the association of Nitin Birimal in co-ordination and supervision of the surveys mentioned in the text and in identifying the castes of candidates.]

- 1 Between 1975-76 and 1985-86, enrolment in primary schools rose by 42 per cent, in secondary and higher secondary schools by almost 84 per cent and for higher education the rise was 37 per cent [GoM 1996:160]
- 2 Pawar must have felt that Indira Gandhi's control would be detrimental to maratha domination [Vora and Palshikar 1996:1-7].
- 3 Since 1978 Congress politics in the state has been revolving around Sharad Pawar. He has many friends in non-Congress parties and many rivals in his own party. Since 1989, Pawar has been very actively and vigorously pursuing liberalisation-privatisation. This has led to an inconsistency between his present stand and earlier 'socialist' pronouncements. Also, Pawar's pro-privatisation policies led to another inconsistency, one with his rural following. Not surprisingly, Pawar has been in the eye of one storm or the other. For a summary of Pawar's new policies and his manipulative ad hocism, see, Phadnis (1995)
- 4 State government issued an ordinance to remove the condition of two-thirds majority for passing no-confidence motion against zilla parishad office holders [see also, Vora and Palshikar, 1996:115-21]
- 5 The data refer to three surveys conducted in 1995, 1996 and 1998. The first was conducted by Rajendra Vora and Suhās Palshikar after assembly elections in 1995. It was partly funded by the ICSSR. The second and the third survey conducted after lok sabha elections was part of the NES 1996 and NES 1998 organised by CSIDS, Delhi, partly funded by ICSSR. Suhās Palshikar was state co-ordinator
- 6 Maratha Mahasangha is an organisation active since the 1980s. One faction of this organisation allied with Shiv Sena during the lok sabha elections of 1996. For details, see, Vora and Palshikar, (1996:220-22), and Pawar (1996). Obsession with kshatriya status and urge to dominate lower castes led one section of marathas to adopt the ideology of hindutva. For a discussion of this point, see Vora and Palshikar (1996:124-26)
- 7 For a discussion of how Shiv Sena's hindutva spread to Marathwada, see Hansen (1996:178-214).

South Asian Conference on Education

Education in the South Asian Context: Issues and Challenges

(November 14-18, 1999)

FINAL CALL FOR PAPERS

Scholars and activists working in the area of education in the South Asian region are invited to present papers in any of the following themes of the Conference:

- Constitutional and legal status of education.
- Policy perspectives and historical experiences in education.
- Education, identity and socio-cultural pluralism.
- Inequalities, disparities and education.
- Knowledge, ideology and the curriculum.

- All abstracts will be screened by the Academic Committee of the Conference.
- Papers selected for presentation should range between 5,000-8,000 words.
- Last date for submission of papers is **October 15, 1999**.

Sectarian Mobilisation, Factionalism and Voting in Gujarat

Priyavadan Patel

After decades of painstaking work the BJP built itself electorally in Gujarat. The state now has a two-party system, mainly at the cost of the Congress. The traditional social support bases of the Congress have been either won over or neutralised by the BJP. Gujarat's electoral experience shows the gradual and then sudden rise of the BJP, its split and decline in 1997 and re-emergence in 1998. While both the major parties are ridden by factional fighting, the lesson the voters appear to have drawn is that even a disciplined and committed party like the BJP goes the Congress way when in power.

THIS article argues that the voting pattern in various elections in Gujarat, especially since the 1980s reflect the strategic and skillful use of caste and religious idioms for electoral mobilisation by various major and minor political parties, coupled with the failure of the hitherto dominant Congress party to perform electorally and politically. The significance of most of the electoral encounters lies in the fact that a two-party system has emerged, though mainly at the cost of the Congress Party. A major political reconfiguration has occurred whereby the traditional social support bases of the Congress have been either won over or neutralised by the Bhartiya Janata Party (BJP). The previous two state assembly (SA) elections of 1995 and 1998 and the three Lok Sabha (LS) elections of 1991, 1996 and 1998 in Gujarat reveal a major rupture and shift in the pattern of political dominance. Recent BJP rule in the state has been quite chequered and has remained a mixed bag in terms of the broad parameters of political and democratic governance. While its electoral performances have been quite remarkable, its track record in the field of developmental and administrative governance is not so distinctive. We shall see how its two spells of rule in the state, first from March 1995 to September 1996 which caused a great deal of disillusionment and disappointment among the people, and second from February 1998 till February 1999, which opened up the floodgates of fascist campaigns against the minorities, were marked by lacklustre performance, misrule and misgovernance in Gujarat.

The BJP had emerged in Gujarat with a claim of making it a state with a model rule and of itself as being a party with a difference, which also promised good governance to the entire country. Ever since its coming to power in the state in March 1995, the factional infighting and mismanagement of affairs within the party, mainly over the issue of sharing the power and spoils of office, led to heightened and

widespread discontent among its rank and file on the one hand and frustration among the voters on the other hand (within less than one year of its rule on both occasions). The former spell was far more serious and consequential so far as the internal and organisational aspects of the party were concerned. But the second and current spell of its rule has proved to be far more lethal to democratic and secular governance in Gujarat as Muslim and Christian minorities were targeted for fascist hounding, besides registering other failures in law and order and developmental spheres of administration and governance.

In the last one year, two bye-elections were held in the state. One was held for Bharuch Lok Sabha constituency in November 1998 as a sitting BJP MP, Chandubhai Deshmukhi had passed away. The second bye-election for two legislative assembly constituencies was held in February 1999 for Jodia and Jetpur seats in Rajkot district of Saurashtra region. Both the seats had fallen vacant by the deaths of sitting BJP MLAs. The outcome of these bye-elections provide interesting opportunities for interpreting the popular verdict on BJP rule in Gujarat which is discussed in greater detail later in this article.

It must be stated that the voting behaviour in the 1990s, in terms of voter turnout, has fluctuated considerably from one election to another and it warrants an exclusive interpretative exercise. This will enable us to obtain insights into popular perception on the working of the BJP government and likely clues to the unfolding of future political scenario in the state. As is known, there was a very good voter turnout during the SA elections of March 1995 but the LS elections of April-May 1996 recorded very low level of poll campaigning and registered the lowest ever voting turnout. This was chiefly on account of development of sharp divide within the ruling BJP which was vertically split into two parts, leading to the birth and formation of the

Rashtriya Janata Party (RJP). BJP lost power to the Congress-supported RJP for about one year.

The Gujarat electoral scene of the 1990s has shown the high as well as low levels of political mobilisation and has witnessed the frittering away of a precious mandate built by years of laborious, patient and gradual organisational efforts by the BJP. The stubborn, uncompromising and unrealistic politico-ideological positions and hardened attitudes of the Rashtriya Swayamsevak Sangh (RSS), Vishwa Hindu Parishad (VHP) and the Bajrang Dal (BD) – dominated sections of leadership led to the costly course of 'draining the had blood out' to the extent of risking the very life of the BJP itself. As an aftermath of this, the wounded BJP leadership and frustrated RSS-VHP-BD cadres went on a rampage, hunting and harassing members of the separated rebel faction led by Shankarsinh Vaghela, the BJP's chief architect and builder in Gujarat. The entire outfit turned fascist against its own self, i.e. against all its rebelling or dissenting cadres, workers or office-bearers.

There is somewhat of a parallel to this development insofar as it revealed its external fascist face after November 1998. It was manifested in attacks on and terrorising of Muslim and Christian minority communities over the social issues of intercommunity marriages between Hindu-Muslim boys and girls and over the issue of religious conversions of tribals by Christian missionaries in the tribal dominated areas of eastern Gujarat. The RSS-VHP-BD continue to operate in a fascist style under the protection of the state and central governments, and their terrorising the minority communities is an unexpected, unprecedented and unforeseen development in Gujarat. These developments are sure to leave their mark on the forthcoming elections. The licentious operating of Sangh parivar in Gujarat is quite likely to cost the BJP politically. The indication of such a trend is already becoming mani-

festly visible on the national scene. The gameplan of hinduwa politics by the Sangh parivar has been sufficiently exposed in the violent attacks on minorities in Gujarat, Orissa, Madhya Pradesh and on the scheduled castes in UP and Bihar. It seems that if the BJP has to survive politically in a democratically organised political arrangement and order, not only in Gujarat but in the entire country, then it has to learn to maintain a proper distance from its Sangh parivar constituents of RSS-VHP-BD. The political experience of 1990s in Gujarat points towards such a conclusion. The two spells of BJP rule in Gujarat in the 1990s, thus show that its inept governance has deeply wounded democratic institutions and processes on two counts. Firstly, to reiterate, its organisational structure that has increasingly become intolerant of internal dissent and has thereby damaged the practice of internal democracy and secondly, its anti-minorities fascist campaigns have damaged the process of democratisation of Gujarat society and politics. The forthcoming 1999 LS polls are all set to become the litmus test for secular forces in weaning away the BJP voters in the interest of secular and social democracy in Gujarat. The onus of achieving such a reversal is clearly on Congress and RJP shoulders and it remains to be seen how they go about it.

NATURE OF POLITICAL COMPETITION

In this section, we shall examine the basic determinants of political and electoral competition in the state. We will take a brief historical view of its present socio-logical and demographic composition. Various ethnic, communal and caste cleavages will be focused upon along with regional and socio-political differences. An attempt is made to explain the influence of these socio-regional and economic determinants of political and electoral competition in the state. This is proposed to be done against the overall background of electoral outcomes in the Lok Sabha (1952-85) and state assembly (1960-95) elections held in the state.

Since the state's birth in May 1960, electoral politics in Gujarat has witnessed numerous ups and downs. In the first decade of its birth, the Congress party enjoyed a good deal of popular support, although it was caught in a sharp and intense clash between its elected wing, led by the first chief minister, Jivraj Mehta, and the organisation wing dominated by Morarji Desai. During this period, a strange rightist political configuration of feudal, ex-princely elements, rich farmers, industrialists and conservative bureaucrats

emerged in the form of the Swatantra party. It succeeded in posing a major electoral challenge to the Congress, as it successfully penetrated the Congress' kshatriya votebank. As can be seen from Table 1 the Congress got 50.8 per cent votes and 113 out of 154 seats in the 1962 state assembly election, while the BJP (then BJS), at present its adversary, then got 1.4 per cent of votes and no seat. The BJS lost deposits on 23 of the 26 seats it had contested. This indicates how difficult it was for the BJS to create a toehold in the political society of Gujarat. Its presence was negligible to the point of non-existence. In 1967, the Congress suffered a loss of 20 seats and 4.8 per cent votes. The Swatantra party won 66 seats and 38 per cent votes. The Jan Sangh (BJS) contested 16 SA seats and for the first time won one seat out of the nine it contested in Saurashtra region, gaining an overall vote share of 1.9 per cent. This analysis also indicates an early registration of the bipolar nature of this state's politics. It must be noted that the BJS registered a very gradual growth during 1960-75. After 1967, it began contesting elections to municipalities and municipal corporations in Gujarat.

Table 1 shows that Congress dominance was absolute. However, the three general elections of 1967, 1971 and 1977 reduced its vote share and seats too. In 1967, the Swatantra party made a major dent in Congress dominance. The Congress split of 1969 affected its performance in 1971, while the emergency brought it down to the worst ever. Interestingly, the BJS/BJP did not yet figure much on the electoral map of the state. In the 1984 LS poll too, the BJP won one seat in north Gujarat and got a vote share of 18.6 per cent.

In the 1972 assembly elections, while Congress dominance continued and in-

creased, the BJS also improved its performance, albeit marginally. It contested 99 seats, lost deposits in 68 and won only three seats with a relative increase in its vote share of 9.3 per cent. The BJS retained its earlier sitting seat in Saurashtra and won two in north Gujarat. Its contesting of 99 seats does speak of its increased organisational strength and horizontal spread, which however could not result in its winning more seats. In 1975, its vote share declined to 8.8 per cent but the seat tally went up appreciably. In all, it contested 40 seats. In terms of regional break-up, the BJS made from modest to major dents in all five regions of Gujarat. In Kutch, out of a total of six seats, it contested two and won one. In Saurashtra, out of a total of 52 seats, it contested 19, won five and lost deposits in five seats. In north Gujarat, it contested seven out of 32 seats and won five. For the first time it won two seats in south Gujarat. It contested three out of a total of 29 seats. In central Gujarat, out of a total of 63 seats, it contested nine and won five. Its base expanded in the urban middle classes who were desirous of clean, committed and principled politics as against the unprincipled politics of the Congress. In 1980, the former BJS got transformed to its new 'avataar' and contested elections as the Bharatiya Janata Party. In a poll for a total of 182 assembly seats, the BJP contested 127, winning only nine and losing deposits in 66. However, its vote share increased considerably to 14 per cent. During this period, the social profile of the state was getting recast. Increased industrialisation and urbanisation was leading to a gradual expansion of its middle class base. Sotter versions of hinduwa and anti-Muslim propaganda had begun to appeal to new upcoming middle classes. In south Gujarat, its vote share increased from 4 per cent

TABLE 1: RESULTS OF GUJARAT STATE ASSEMBLY ELECTIONS, 1990

Region	INC	BJP	JD	Other Parties	Minor Parties	IND	Total
Kutch (6)	6-2-0 (38.4)	5-4-0 (45.3)	1-0-0 (4.3)	7-0-7 (1.4)	2-0-2 (0.1)	29-0-28 (10.6)	50-6-37
Saurashtra (52)	52-7-8 (27.0)	34-16-7 (24.0)	42-23-8 (30.7)	103-0-103 (3.1)	32-1-31 (1.6)	349-5-330 (13.6)	611-52-482
North Gujarat (32)	32-3-5 (30.4)	31-14-6 (27.2)	23-14-1 (31.0)	46-0-46 (0.8)	12-0-12 (0.8)	151-1-148 (9.8)	299-32-219

in 1975 to 12 per cent in 1980. In the same period, its base doubled in north Gujarat from 10.49 per cent to 21 per cent. These were the times of emergence of the KHAM formation and of the implementation of pro-poor policies by the Congress, and consequent frustration among the middle class urban youths who were unhappy about the reservation policy, communal tensions and riots. The BJP took advantage of these developments and continued to build its base.

In 1985, the BJP's performance remained the same. Its vote share increased by 1 per cent and seat tally by two, bringing it to 15 per cent and 11 seats respectively. The KHAM strategy paid the highest electoral dividends to the Congress in the state, more than it had ever received so far, both in terms of number of seats and percentage of votes. Out of a total 182 seats, it won 149 seats and 55.55 per cent votes. During this long phase of electoral competition between 1960-85, the caste conflict between the patidars and kshatriyas dominated the scene. The patidars emerged as a new elite and took control over the state's political and economic resources. The kshatriyas suffered a decline on both counts. The patidars, thereafter, began to shift to non-Congress political parties, namely the Janata Dal and the BJP, as the Congress was increasingly turning pro-poor under Jhambhai Darji's KHAM grouping. The dominance of higher castes like the banias and brahmins declined with the emergence of Chimanbhai Patel. After a while the kshatriyas and KHAM constituent castes regrouped to challenge patidar dominance from within the Congress. Pushed out from the political arena, the patidars found the BJP's hindutva plank quite handy. This entire period can be characterised as that of a step-by-step build up of the BJP even as the virtual and absolute dominance of the Congress continued. Pro-poor policies under the KHAM strategy and the anti-higher caste rhetoric of the Congress under the national leadership of the Gandhis put it on the high road of electoral success in the state. However, fierce communal and caste riots, along with intense factional infighting within the Congress in its 1980s, began to weaken it irreparably within less than a year of such a massive mandate. The KHAM constituents created a creamy elitist layer within each of them and gradually got divorced from their mass bases. Caste and communal riots gradually dismantled the KHAM alliance.

The coming years marked the historic decline of Congress and the quick emergence of the BJP. After a year of peace in 1985, caste and communal riots erupted

again. By 1986-87, conditions in Gujarat deteriorated so much, lawlessness and instability increased so much that the union government and Congress high command openly lamented the fact and declared Gujarat a 'problem' state. None in the Congress knew how to restore normalcy, order, peace and caste-communal harmony in Gujarat. The rot of Congress factionalism had spread to district and taluka levels by 1987. Between 1986 and 1988, there were more than 110 bombings. In Saurashtra, several MLAs like Sorathia, Thakrar, Bhimji Patel and Bharat Kamhalia were murdered. In July 1988, the 60,000-strong state police force revolted against the Chaudhari government. The 1990 state elections paid the proper electoral wages to the political parties in Gujarat. As can be seen in the Summary Tables, the Congress reaped a well-deserved harvest of only 33 out of the 182 seats it contested. Its vote share fell from a hefty 55.55 per cent in 1985 to the lowest ever of 31 per cent. This was the reward of absolute political and organisational bankruptcy which had infected it since the early 1980s. The BJP, all along, was gaining mileage from this situation and expanding its base by continuously resorting to agitational politics. The state and national leadership of the BJP saw great possibilities opening and they systematically worked towards their goal of pushing the Congress out of power.

The BJP first captured urban local governments in towns and cities. Thereafter, it targeted the major traditional support groups of the Congress, such as the kshatriyas, OBCs, SCs and STs in rural-tribal areas. The politics of religious mobilisation proved quite effective and rewarding for it. The BJP contested 143 seats and won 67, even though, on 46 seats, it lost its deposits. Its vote share increased to 26.69 per cent. The Janata Dal of Chimanbhai Patel won 70 seats and got 29 per cent votes. In all regions of Gujarat, its performance was remarkable. The BJP shared power with the Janata Dal, although subsequently, experiencing 'suffocation', it decided to pull down the Patel government. In the 1991 Lok Sabha poll, it emerged a clear winner. It captured 20 of the total 26 seats it had contested. It led in 119 assembly segments whereas the Congress could lead only in 45 assembly segments. Its vote share shot up to 50.4 per cent. It, however, failed to win any seat in tribal areas, losing all the four ST seats. Everybody knew that if assembly elections were held, the BJP would make a clean sweep. Patel stood between the two, i.e., elections and a BJP victory. He mustered Congress support and continued to rule.

The BJP's sweep was so complete that the chief minister's wife Urmilaben Patel, despite being a public figure in her own right, was defeated from Saurashtra. Despite such disasters, the Congress continued to support the JD(G) ministry. In order to stall occasional opposition to his government, Patel decided to merge his JD(G) into the Congress. The Congress was badly mauled by the BJP in the 1991 Lok Sabha elections. It got more and more alienated from its conventional support bases. The 'rathayatras' and Ram mandir yatras in the tribal belt proved highly rewarding. The BJP sold a brick for the Ram mandir in Ayodhya at Rs 1.25 each, to all those tribals who wanted to join the Hindu fold. The Congress did nothing to intervene and prevent the BJP's expanding base. The Congress leadership failed to rise above factional squabbles and had no courage to go to the voters and face them. After the Lok Sabha elections of 1991, the writing on wall was so clear that it went on postponing the local body elections under one excuse or the other. Only a high court order forced it to conduct elections. As a result, local body elections were held in 54 municipalities in January 1994. The BJP left the Congress far behind, giving clear signal that it had arrived in the state. Out of a total of 1,803 municipality seats, the Congress could win only 311 seats and 16 per cent vote, whereas the BJP won 625 seats and 30 per cent vote. The independents too won a large number of seats.

This performance proved that the merger of JD(G) into Congress was only a mechanical one and it did not jell into an organic whole. In 1994, during the Rajya Sabha elections, the chief minister, Chimanbhai Patel, died and this cleared the way for the BJP. At the time of nomination of candidates for the 1995 assembly election, factional warfare in the Congress resurfaced with hitherto unseen fury. The BJP too, was not free of the malaise of factionalism and rebellions. It was amply clear to everyone in the state that now it was the BJP which would capture power and that, therefore, there was an unmanageable scramble for its nominations. The JD(G) faction in Congress, despite having merged, maintained an independent existence and succeeded in getting a larger share of nominations and those who could not get them, contested as independents. BJP rebels also contested as independents but the important difference was that none of them won as none from within the BJP gave any overt or covert support to them, while Congress rebel candidates enjoyed secret support from inside and as a result, a few of them won.

Voter turnout in different regions of Gujarat amply indicates that the BJP's politico-religious mobilisation in the form of agitational and yatra politics indeed had a telling impact on the voters. Table 2 compares the 1995 regionwise voting turnout with the 1990 data and it is clear that politics of religious mobilisation has paid hefty political dividends to the BJP. This election recorded the hitherto highest turnout of 64.36 per cent as against the earlier highest of 63.7 per cent in 1967. The northern region registered the highest turnout of around 70 per cent. What surpassed all expectations was the turnout of tribal voters. So far it had hovered at around 49 per cent. The lowest ever tribal voter turnout of 45 per cent was registered in 1985 and the highest of 55 per cent in 1967 elections. In the 1995 elections it surpassed the state average and recorded 70 per cent. The tribal votes had come to BJP almost in the weight of the Ram mandir bricks it had successfully sold during its yatra earlier. The usual link that is supposed to exist between anti-ruling party sentiments and high turnout does not seem to hold for the 1995 polls. The BJP and Congress both won in constituencies where the highest as well as lowest turnouts were recorded. As Yogendra Yadav ('Gujarat: BJP Arrives: A Neat Two Party Structure Emerges', *Frontline*, May 5, 1995) has observed, the BJP's arrival heralded the emergence of 'a neat two-party structure'. The BJP's promises during this long decade of politics of agitational and religious mobilisation raised peoples' expectations to the skies. It promised a political order without fear, hunger, crime and corruption. Unfortunately these heightened expectations were left unfulfilled and a fierce power game erupted in the BJP, shattering its dream of making Gujarat a model state for the entire country to emulate.

CONTEXT OF 1996 ELECTION

As we have noted, in March 1995, the people of Gujarat had voted the BJP to power with a clear-cut majority and with high hopes that it would remove the reign of fear, crime, violence, hunger and corruption from public life in the state.

The same mandate was repeated in the district and taluka panchayat elections. For the first time in the history of the state, the BJP came to rule the panchayats. It won 18 out of 19 zilla (district) panchayats and 154 of the 183 taluka (sub-divisional) panchayats. In all, it won 624 out of 767 district panchayat seats, amounting to 82 per cent, while the Congress managed to win only 166 seats, that is, a mere 15 per cent. Independents won the remaining 21

seats. In the taluka elections too, the BJP managed to repeat the performance. Out of 3,785 seats, it won 2,567 seats, comprising 68 per cent, whereas the Congress won only 902 seats, constituting only 24 per cent of the total seats. The independents won 315 seats. The rural vote had gone to the BJP in the hope that it would provide drinking water to 'no-source' and water-scarce villages as also for agricultural purposes and provide electric power for irrigation. This hope was shattered within less than a year partly because the BJP had not learnt the plain lesson of politics properly: that it is simpler to get power and much more difficult to share it judiciously with other partners, contenders and claimants. This cardinal principle of democratic politics escaped the local as well as national level leadership of the party as it was engrossed in celebrating its victory and tasting the first spoils of power. The BJP soon found the task of finalising the list of heads of various boards and corporations very difficult. The chief minister consulted Narendra Modi, the general secretary of the state unit of the BJP more frequently than he did its president Kashiram Rana. The organisation man Shantersinh Vaghela, who built the BJP in Gujarat, brick by brick over long years, was sidelined. The chief minister released the list of heads of boards and corporations just before he went abroad to invite foreign investments to the state. The list was like dropping a bombshell on the BJP and its supporters – aspirants to the spoils. Before this, it could barely manage constituting a cabinet, as it had not been able to strike a balance between the various claimants and ended up generating great discontent.

The sub-regional petty rivalries soon came to the fore. In north Gujarat, there were cut-throat political rivalries between Atmaram Patel, a seasoned, crafty and well-rooted leader and A K Patel, party MP of long standing. A K Patel being closer to the chief minister-Modi faction, prevailed in keeping Atmaram Patel out of the cabinet and also out of the list of heads of boards and corporations. This angered Atmaram Patel and he joined hands with Vaghela and began the process of forming and consolidating a powerful faction to first check the excesses of the chief minister-Modi faction, and later revolt if need be. Many of Vaghela's supporters were also left out of the list by the chief minister. The seeds of internal discontent and factional warfare had thus been sown as a result of extremely lop-sided and politically unwise sharing of positions of power. The third major blow to its image of a 'disciplined' and 'committed' party

came while it began to govern and function. A coterie of a few men close and related to the chief minister and led by Modi, became the de facto centre of power. Major policy decisions and administrative instructions began to flow from this unconstitutional centre of authority. The ruling party's own MLAs could not get appointments to see the chief minister. The coterie gave sufficient and loud hints that it was they who mattered and ruled the state.

In the realm of policy-making, its execution and general governance, the inexperienced but ambitious BJP government burnt its fingers again and again by raking up controversial and sensitive issues. In order to quickly create an image of a 'model ruler', the party went on a blunder-prone. All the while it had the Congress as its target. It wanted to destroy it along with its 'minority-appeasing policies'. It launched an anti-Congress drive to demolish all centres of Congress support and dominance. It attacked the most powerful and deeply entrenched builder's lobby whom it saw as the backbone of the Congress in Gujarat. Many builders ran away from the state as their construction projects came to a standstill and as they were afraid of more harassment. Some were arrested under PASA or TADA. The next target was chairman of National Dairy Development Board, V Kurien, the architect and engineer of white revolution in India through his now famous Anand Pattern. The minister of civil supplies, Jaspal Singh, a former populist IPS officer-turned-politician, brimming with frenzied enthusiasm began raiding the godowns of NDDB. He also raided various hoarders and adulterators and sent out shockwaves among the traders in general. Kurien, unlike the builder's lobby, stood his ground and even counterattacked. The BJP government beat a hasty retreat and closed the chapter in favour of NDDB. Then came the turn of the union government. Jaspal Singh accused Buta Singh, a union minister, of being corrupt and sheltering anti-national

TABLE 2: VOTING TURNOUT BY REGIONS IN 1990 AND 1995 ASSEMBLY ELECTIONS

Region	1990	1995
Gujarat	52.2	64.4
Tribal	46.4	69.9
Rural	55.2	67.7
Semi-urban	55.1	63.5
Urban	46.4	55.4
Saurashtra (includes Kutchha)	49.1	61.8
North Gujarat	57.1	67.7
Central Gujarat	54.1	67.7
South Gujarat	48.9	67.6

clements. The health minister was almost caught red-handed in instigating and inflicting caste violence on dalits of Kadi town in north Gujarat. Education minister Nalin Bhatt, in a hurry to clear the mess in this field, launched a crusade against private tuition classes. He began to arrest teachers and video-shoot the running of tuition classes. The private tuition classes closed and many urban middle class parents lost the fees they had paid without receiving the service, as tuition fees are always collected in advance. According to one estimate, the private tuition classes in Ahmedabad city alone do a business of Rs 3 crore per annum.

In the realm of governance, the government's scheme of subsidised foodgrains at Rs 2 per kilogram ran into rough weather. As against the allocation of Rs 124 crore in the first year, the next year's budget provided for only Rs 77 crore. This reduction affected 8 lakh beneficiaries. As per its electoral promise, it slashed state transport bus fares by 20 per cent. This resulted in revamping transport coverage which deprived several remote rural and tribal areas of bus services. It launched several populist schemes to win over the beneficiaries as permanent vote banks. A populist scheme called 'Kuverbai nu mameru' (wedding dotes for the daughters of the poor) was launched with an allocation of Rs 5 crore. The Saraswati Sadhana scheme was launched for school-going tribal girls who were given bicycles. The Gokul Gram Yojana (village uplift scheme) was launched with big publicity but an allocation of a mere Rs 72 crore proved to be inadequate to meet real needs in villages.

On the political front, the BJP soon began to be equated with the Congress. The feeling that the BJP was simply replicating Congress culture and not providing an alternative, began to develop and spread right from the beginning. The open rebellion by Vaghela in October 1995 did serious damage to the party's image as a disciplined outfit. Vaghela is credited with having played a very crucial role in expanding the BJP's base in rural Gujarat by garnering up the support of the kshatriyas and OBCs for the BJP. Vaghela had all along been nursing his wounds, having been denied chief minister's post and his men kept out of office. This generated deep discontent. The national and state leadership failed to handle Vaghela's dissidence skillfully and imaginatively. The whole episode exposed the BJP's immaturity and inexperience. The struggle for power and domination within the party had all the elements of a suspense thriller – of hijack, violence, acrimony,

tragedy. It was also a comedy which the people of the state and outside watched with amusement and some shame. Vaghela and his 49 dissident MLAs were hounded and harassed so much that he had to take them away to Khajuraho, Madhya Pradesh in a private plane for their safety and security. After this episode, the party came to be popularly known as a party of 'Hazoorias' (pro-chief minister-Modi group, literally, yes-men) and 'Khajoorias' (Vaghela's MLAs who flew to Khajuraho). After this episode, initially a latent, and then open, fight broke out between the two groups. The ousted chief minister and his Hazooria faction, mainly cadres belonging to the RSS, Bajrang Dal and VHP, began to fight it out in streets, unmindful of party image or interest. In mid-December 1995, even the presence of Atal Behari Vajpayee could not deter the Hazoorias from disrupting a public function at Surat during which chairs were tossed at the dias. In January 1996, the former chief minister was presented with a sword at a public function at Dehgam near Ahmedabad ostensibly 'to kill Vaghela's Khazoorias' at the next opportunity. Again on January 20, 1996, in a big meeting of party workers at Ahmedabad, the party president, L K Advani could not stop the continuous shouting of anti-Khazooria slogans and beating up of the city's former mayor Mukul Shah by the Hazoorias. The party somehow managed to prevent cross-voting in the Rajya Sabha election. Just before the April-May 1996 Lok Sabha poll, the party was going through a phase of intense factional fights and a vertical split was almost on the cards. A fragile rapprochement was being worked out by a few politicised heads of temples but the former (ousted) chief minister was unwilling to call a truce with the Vaghela faction.

From the above account, it is clear that the BJP's popularity was likely to suffer heavily. Its losses could have been much greater had the Congress been in some shape. The Congress lost one golden opportunity after another to work as an opposition party and embarrass the BJP. The BJP went on offering issue after issue to it, but it failed to capitalise on them. It existed as a motley combination of various factions led by five or six top leaders, all pulling it in opposite directions for trivial gains and losses. The Congress literally sealed its own fate in the state, having suffered from massive internal squabbles, personality clashes, lack of a visionary and committed leadership, mutual suspicions and narrow partisan loyalties among its members. All in all, BJP's misrule is not likely to change electoral outcomes in the state in a sub-

stantial way. A few seats here or there may change hands. Only if the Congress resurrects itself or a third force rises, can a serious threat be posed to the BJP.

The 1996 polls in Gujarat were held in two phases – for 12 seats in the first round on May 2 and for the remaining 14 seats on May 7. There were two major parties in the contest. There were other smaller parties like Congress (Tiwari), Janata Dal, Gujarat Adivasi Vikas Paksh (GAVP), BSP, CPI, CPM, Samta Party, Akhil Bharatiya Jan Sangh, RPI, etc. which also jumped into the fray. There was very little scope of alliance formation or seat adjustments as the main battlelines were strictly drawn between the BJP and the Congress. As a prelude to the Lok Sabha polls, the BJP supremo Advani had launched another rath yatra from Ernakulam in Kerala which would cover 13 states and 8,849 kms and end in Delhi on April 14 1996. It was called suraj yatra or a march for 'good governance'. It was declared that while the BJP's rath yatra in 1990 had been for the Ayodhya temple, the 1992 ekta yatra for the Kashmir issue, the suraj yatra was for entering into the parliament. On March 18, the suraj yatra entered Gujarat. It was reported that hardly 500 people went to receive it in Bhilad. Vaghela and his supporters abstained. The yatra did not receive the expected response. Its meetings at Pardi, Navasari, Valsad, and Surat were ill-attended. These meetings laid bare the internal conflicts within the party. In Baroda, MLA Karan Singh Raj, belonging to the kshatriya faction, remained absent while the newly appointed state secretary, Chuntibhai Baraiya, a tribal, was serving water to the dignitaries on the dias during the Baroda public meeting. Along with Vaghela, chief minister Mehta also remained absent. An undeclared strategy in the BJP was gradually unfolding to eliminate Vaghela and his Khazooria supporters from the state's politics by denying them nominations or if nominated, by defeating them by sabotaging their poll campaign from within the party. Such factionalism also determined poll nominations in the Congress.

The Kutch-Saurashtra region, for example, has nine Lok Sabha seats. In the 1991 Lok Sabha poll, the Congress was able to win only one seat in Kutch. The remaining eight seats were won by the BJP. In 1996, the Congress did not renominate its sitting MP, Haribhai Patel in Kutch. Instead it brought in an outsider Dinesh Trivedi, a Calcutta-based businessman, backed by prime minister Rao but unwanted by local Congressmen. Trivedi had left the Janata Dal and joined the Congress just before filing of nomi-

nations. Haribhai Patel, sitting MP, resented this. He protested and decided to work for Trivedi's defeat.

The BJP leadership decided to allocate four Lok Sabha seats out of 26 to the RSS. Of these, three RSS candidates were to be absorbed in Saurashtra. As a result, the BJP denied re-nomination to three of its sitting MPs – in Bhavnagar, Porbandar and Rajkot. The sitting Rajkot MP (he had been winning this seat for two terms), Venkaria revolted against the party's decision and joined the Congress and secured its nomination. It was reported that Venkaria had joined the Congress for protection of his life and family. He developed differences with Vaghela sympathiser Chiman Shukla, a staunch RSS leader in Saurashtra. However, the local congressmen did not receive Venkaria's nomination cordially. As a result, it was quite a puzzle to find out who worked for whom in Rajkot.

The Congress was beset with similar problems. In Baroda, there was strong opposition by a group of congressmen to any gawkwad member being nominated for the city Lok Sabha seat. The Muslims had, though, suggested Ranjit Singh Gaekwad's name. His wife was initially keen on a Congress nomination despite stiff opposition from within but later opted out. The BJP's state general secretary and education minister, Nalin Bhatt was keen on her nomination from BJP whereas the BJP city unit president opposed it. The BJP decided to retain six sitting MPs. For the remaining 20 seats, the lists were sent to Delhi. The BJP faced a tough time deciding its nominee for the Baroda seat. The Hazooria and Khazooria factions fought it out fiercely. The nomination for the Anand seat was claimed by nine BJP contenders. The patidar and kshatriya candidates were posing problems of selection. The nominations for Kapadvanj in Kheda and Godhra in Panchmahal posed major problem. The Congress faced opposition from the erstwhile JD(G) faction, even though it stood merged with it, thanks to Chimanbhai Patel.

The campaign issues too kept changing tune and colours. The BJP launched its campaign on the hindutva card. The Congress raised economic issues. It condemned the BJP's in-fighting and communalism. The BJP was more effective in raising vote-catching slogans. Its campaigning was more organised than that of the Congress. The BJP's Hazooria faction joined hands with RSS-VHP to defeat their own Khazooria candidates. Shankersinh Vaghela was facing very difficult times in Godhra. Hindutva organisations worked for his defeat. Sadhu-sants

held dharma sabhas in Godhra and openly appealed to the people to defeat the 'Hindu-traitor' Vaghela. In other places, issues of corruption, criminalisation of politics, security, anti-national activities were raised by the BJP.

ELECTIONAL TURNOUT OUTCOME

The voters' disinterest and apathy towards the waveless, issueless and lacklustre 1996 general elections stood out as its most characteristic feature. Voting was the lowest in the state's history. The voters' apathy has baffled one and all. Vacations, heat, wedding season or migratory labour are inadequate to explain such exceptionally low turnout as these factors applied to other elections too. Widespread corruption in high places and the dishonest, double-faced conduct of politicians is also not a satisfactory explanation as Gujarat is not the only state affected by or sensitive to this phenomenon. What was specific to the state was the fierce factional infighting between two continuously warring groups of Hazoorias and Khazoorias in the BJP on the one hand and the lack of a united, competently managed and directed campaign by Congress on the other. This could certainly have dampened voter's enthusiasm but even this cannot by itself explain the phenomenon. With the election commission enforcing a strict code of conduct, the parties kept a sharp eye on campaign expenses. The candidates did not print and distribute the usual voter's slips, indicating all details of which booth to go to cast their votes. Many voters remained confused. This too could have contributed in some measure but does not provide a sufficient explanation as the EC's norms operated in the entire country.

Low voter turnout can be understood better by looking into the workings of the two major parties in the state, the BJP and the Congress. The BJP's storming to power in state in 1995 with the promise of a crime-free, clean politics for people's welfare, instead of the Congress brand politics of power and partisan interest, had heightened people's expectations a great deal. As we saw, the BJP's failure to share power wisely resulted in endless internal squabbles. The Congress too continued to remain divided. The people hardly had an incentive or choice to vote. If we compare the sexwise voting figures for 1996 with those of 1991, we can see the sharp drop among both. The male and female voting percentages decreased from 50.55 and 37.07 per cent in 1991 to 42.02 and 29.56 per cent respectively in 1996. Urban female voting declined noticeably. In Rajkot and Ahmedabad, it fell to as low as 24.41 and 21.29 per cent in 1996 from 41.92 and

31.35 per cent in 1991 respectively. Similarly, in Baroda and Surat, the same decreased to 24.81 and 28.59 per cent in 1996 from 41.54 and 37.12 per cent in 1991. This is an alarming development for democratic polity. It indicates the failure of canvassing and campaigning machineries of contesting candidates of both the major parties. More importantly, it shows that the credibility of the state regime and its popular legitimacy stand woefully eroded.

As Table 1 shows the results have sprung quite a few surprises. The BJP suffered losses and the Congress made gains. The BJP's vote share declined marginally from 50.4 per cent in 1991 to 48.4 per cent in 1996, while the Congress vote share went up sharply from 29 per cent in 1991 to 38.1 per cent in 1996. From a tally of 20 seats in 1991, the BJP could win only 16 out of 26 Lok Sabha seats. The hindutva forces, led by the RSS and VHP, manifested in the form of Hazoorias in the BJP, had decided to decimate the Khazoorias politically. As election day neared, they openly targeted Vaghela, the leader of the 'October rebellion', who was contesting from Godhra. Despite the BJP having big support in six of the seven assembly segments, Vaghela lost by a margin of 3,228 votes. The sadhu-sants made the Sarsa temple in Kheda their base to fight Vaghela. They took out a procession from Sarsa to Godhra. They moved through the entire town and declared that "by not voting for Vaghela, every pious, religious Hindu voter can earn the blessings (punya) of chardham yatra". The other slogan was: 'Santoni Chhe ekaj vaat, Khazooriaone maro laal' ('One and only message from saints is to kick the Khazoorias out'). Three of Vaghela's staunch supporters also lost in Surendranagar, Banaskantha and Baroda. Vaghela blamed these losses on a plot masterminded by the Hazooria leaders Keshubhai Patel and Narendra Modi. The Summary Table also indicates that in Gujarat the contest was essentially between two national parties as all the 26 seats were won between the two. No other party could come anywhere near posing a challenge to these two main rivals except in some places like Baroda where the two independent candidates captured 1,51,632 votes and the winning Congress candidate got 1,31,248 votes. It is interesting to note that 522 out of 577 candidates lost deposits. All parties other than the Congress and the BJP and the independents put together could muster only 12.79 per cent votes, fielding 555 candidates.

The tribal and Muslim vote became decisive. The Congress had so far been continuously losing its prime support base

of Muslims, ST and SCs to the BJP. A decisive halt was visible in this process in the outcome of these elections. In the entire tribal strip of the state, the BJP could put up a good performance only in the Valsad seat where union minister of state for rural development, Uttambhai Patel was defeated by the BJP's Manibhai Chaudhari by a narrow margin of 368 votes. Three factors seem to be responsible for Congress defeat in Valsad. The first was that a very huge number of disputed 10,008 votes were declared as invalid; second, that some Muslims in this constituency having historically and comparatively better communal harmony, voted for the BJP and the third, most decisive factor was the contest by Tiwari Congress, led by the old horse of the Congress (I) Zinabhai Darji. His goal was to ruin the prospects of the Congress (I) candidates in Gujarat and prevent them from winning. He succeeded in Valsad. The deposit-losing Darji nominee Naginbhai Patel, a relative of Uttambhai Patel, ruined the latter's prospects with his measly 1,308 votes, and this seat was lost to the BJP by a narrow margin of 368 votes. Everywhere else, Darji failed miserably as all the 19 of his tribal and other nominees lost deposits. These elections, thus saw Darji, the disillusioned Congress veteran of many electoral battles who had failed to rectify or reform the party from within, breaking away from it and jumping onto the Congress (T) bandwagon to damage Congress prospects.

As is evident from Table 3, a good deal of Muslim vote went to Congress but many also voted for the BJP. But on the whole, the Muslim voters had kept one and all guessing. There was no unanimous communal/collective statewide decision or strategy among the Muslims regarding whom to vote for. For instance, in Baroda it was left to the Muslim voters' own judgment, although they were advised to vote for a secular candidate. In Ahmedabad, the only Muslim candidate of the Congress was defeated because of two reasons. One, as Vaghela also conceded, his Khazooria candidate won because the opponent candidate was a Muslim. In the BJP's scheme of things, a Hindu Khazooria is better than a secular Muslim. Secondly, there was the apathy of the Muslim voters in Ahmedabad. Despite Muslims having 20 per cent of the total vote, the seat was lost. The voting was lowest at only 27 per cent in Ahmedabad. The Ahmedabad Muslims did not approve of the Congress and therefore, kept away from voting despite the Congress nominee being a Muslim. In Godhra, Muslims voted for Congress as Shantibhai Patel enjoyed

enough trust among them. In Valsad, Muslim voting showed a mixed trend of voting for both the parties. In Baroda too, the Congress candidate got Muslim votes. In the reserved SC Lok Sabha seats in Dhandhuka and Patan, the dalits favoured the BJP. Despite a division of dalit votes into chamars and vankars, the BJP won both the seats. The chamars voted en bloc for the BJP, whereas the vankar votes were split between the Congress and Congress (T). On both the seats, the voting was about 32 per cent. Besides, Table 3 also shows, across various variables, that Congress losses were BJP's gains. For instance, 60.9 per cent SCs voted for the BJP as against 34.8 per cent for the Congress. Similarly, two categories of educated voters cast 76 and 80 per cent of their vote to the BJP. Some 70 per cent of the new voters in the age group of 25 years and below favoured the BJP. In none of the age groups could the Congress rank higher than the BJP. The Congress could beat the BJP only on the economic and religio-social parameters. For instance, 65.9 per cent of the very poor and 55 per cent of the tribals voted for the Congress. So did the Muslims, 66.7 per cent voting for the Congress. Young, urban, educated and upper class groups voted for the BJP in the percentage band of 70 to 80 per cent as shown in Table 3.

Table 4 offers a regionwise picture and shows that the Hazooria faction, led by the ousted chief minister won eight of the nine seats in Kutch-Saurashtra region. The only seat lost in Saurashtra by the BJP was contested by Vaghlra's Khazooria nominee Koli Patel Sonabhai against a very formidable Congress heavyweight Sanat Mehta in Surendranagar. This seat is rated as one of the best nursed constituency in the state like that of Dinsha Patel's Kheda Lok Sabha seat. The credit for victory in both the cases goes to individual image, profile, commitment and constant contact with the voters rather than to the organisational inputs of the party or to any wave-like phenomenon. In north Gujarat, the Mehsana seat was retained by A K Patel of the BJP by a margin of 1,25,151 votes. A K Patel had wanted to contest from Gandhinagar as he was afraid of Atmaram Patel, a prominent Khazooria rebel leader's potential of defeating him. This seat is a well-nursed hindutva constituency thanks to the well-oiled RSS machinery. A K Patel's somewhat clean image, acquired years ago as a serving doctor in government hospital and then as founder trustee of a well-managed TB hospital in Vijapur, his home town and round-the-clock working of a band of dedicated and trusted RSS cadres and party workers

helped A K Patel win the seat with such a huge margin. The BJP lost two previously held seats of Sabarkantha and Banaskantha to Congress in north Gujarat. The Kutch and Surat seats were lost by the Congress due to unimaginative nominations as outsiders were fielded to face formidable BJP nominees. If a good local candidate were to contest in Surat, the BJP supremo from south Gujarat Kashiram Rana, would have found the going quite tough. Instead, he was given a cake-walk by the Congress. In central Gujarat, the Congress retained Anand and snatched Kheda from the BJP.

SOME FEATURES OF THE 1996 VLRDCI

The results of NES 1996 survey show why the BJP remains popular in Gujarat despite an image tarnished by internal crises. Right from the beginning the voters remained lukewarm to the poll process. The survey (n=484) showed that 97 per cent respondents did not participate in any campaign, about 80 per cent of them did not attend any election meeting and 60 per cent did not show any interest in the campaign. This speaks of the voters' apathy and disinterest in the election process in Gujarat. Door-to-door canvassing by candidates and party workers also remained slack and low-key as 80 per cent respondents reported that none came to canvass at home. As many as 304 out of 484 (63 per cent) respondents stated that except for the election campaign period, they do not take any interest in politics. More than 83 per cent respondents do not feel close to any particular party. At the same time, 94 per cent of the respondents were politically open to favour any party as they have not closed their mind to any particular party. All these probably indicate a correlation between this apathy/cynicism and the BJP's victory. Less than half the respondents (48.3 per cent) felt that their vote had an effect in running the affairs of the country. Does this show that people, despite high levels of apathy, are not averse to democratic politics. Could the low turnout also have worked in favour of the BJP, which despite everything, remains a cadre-based party?

Let us relate this situation to another indicator to see why the BJP benefits. Despite this ambiguous response, 78 per cent of the respondents (378 out of 484) had heard about the demolition of the Bahai masjid at Ayodhya which shows that the event had been continuously hammered as a Hindu triumph by the BJP. This was intended to keep it fresh in people's minds and to keep the ground fertile enough to cash on it politically as and when necessary in future. The hopeful

sign, of course, is that only 17 per cent openly and in an outright manner, justified the demolition and 28 per cent favoured building of a temple at the site as the survey showed.

People in Gujarat, desirous of 'a promised good governance' by the BJP, had actually a Hobson's choice to make. The Congress was not at all in shape to shoulder the responsibility of achieving higher levels of good governance. The people had to turn to the BJP as an 'optionless' option. Had there been a third party of substance and credibility, the results could have been different. The survey data has shown that intentionally and attitudinally the Gujarat voter favours a democratic political order but is disillusioned to find the parties in a mess. The voter in Gujarat still favours the BJP because it is considered the lesser evil. In places such as Kheda and Surendranagar where the track records of Congress' candidates were good, they have been elected by the voters. Elections in Gujarat have shown that the structure of available choice to voters has set limits on the entire electoral process and its outcome. The decade of Congress misgovernance (1985-95) is fresh in the mind of the voters. Unless a more viable, convincing alternative to the existing choice structure becomes possible, the popular perception and responses to various questions and issues of trust in democratic politics will decline in future. In the 1995 assembly elections, people had taken the BJP as an alternative to Congress. But it failed them. The result is popular alienation as shown in Table 5.

Table 5 contains information regarding levels of trust in different democratic institutions among the sampled respondents in Gujarat. It is sad to note that the four major institutions of a democratic political order, viz. party, police, politicians, and bureaucrats, do not enjoy popular trust. Institutions of local self-government, state government, judiciary and the election commission enjoy the highest extent of trust ('a great deal') among the respondents. This indicates that the executive arms of the government have come to suffer erosion of popular credibility and trust. This may well trigger off a serious crisis of legitimacy. On the other hand, credibility of such watchdog institutions as the judiciary and the election commission have increased. People have, it seems, begun to turn away from rule-menders and benders and seek refuge in rule retaining agencies such as the EC and the judiciary.

Since the 1996 election verdict, the people of Gujarat witnessed a high political melodrama. It all began in October

1995, with Vaghela's challenge to the BJP. It saw four chief ministers in a fierce fight for power. Vaghela, during his reign as chief minister for 12 months from October 1996 till November 1997, tried to build a Laloo Yadav-like populist personal political base, but failed miserably. With the entire state machinery behind his bye-election contest in Radhanpur in north Gujarat, Vaghela won the seat. Let us see in detail the nature of political competition, politico-electoral mobilisation by various parties for 1998 assembly and LS polls in Gujarat, the context of 1998 poll, nomination processes and the verdict.

CONTEXT OF 1998 POLLS

We saw earlier how chief minister Keshubhai Patel failed to keep the BJP MLAs together in the wake of Vaghela's revolt which forced his ouster within seven months of his becoming chief minister. Suresh Mehta became the new chief minister in October 1995 and managed to survive until October 1996 when Vaghela formally broke away from the BJP and formed his government with Congress support from outside. The BJP was eventually reduced to the strength of 76 MLAs. Keshubhai was not made leader of the opposition but was shifted to the national executive of the BJP as its vice-president. The interregnum between 1996-1998 saw the rule of Congress supported government of RJP, first led by Vaghela and later by Dilip Parikh. During this period, people in Gujarat saw a fierce competition for support bases and power, firstly between the BJP and RJP and later on between RJP and the Congress. Violent scenes were witnessed in the assembly over contested claims of majority in the house. The governor's role came under fire as it became partisan in favour of Vaghela's RJP and Congress. The office of the speaker and the deputy speaker of the Assembly

TABLE 5. TRUST IN VARIOUS DEMOCRATIC INSTITUTIONS IN GUJARAT

(Per cent)

Institutions	Extent of Trust		
	Not at All	Some-what	Great Deal
Central government	27.7	48.6	22.7

Police	52.8	41.5	4.5

Note: A total of 763 respondents were approached and 484 were available and responded.

also became politicised in this tug of war for power between the three main parties.

Vaghela too faced a daunting task in forming the ministry. He was in a hurry to ground and strengthen his RJP which was afloat without a proper social support base. Vaghela soon found himself hooked on the horns of a dilemma whether to create his own organisational base or to bank on Congress' support which was actually a mercy-lease. In carving his own organisational base, he began offending the Congress by undercutting Congress social support base. He began wooing Muslims as the true protector of their interests. He also began making inroads into tribal and other OBC dominated regions in the state which were areas of Congress dominance. He created five new districts of Patan, Anand, Dahod, Narmada and Navsari and 48 new talukas. This offended Congress and BJP immensely. He came up with a plan to levy one paise per litre on water use by the industries to generate funds for different water supply schemes, and formation of 'Gujarat Ashmita Sabha', etc. He raked up the controversy of reviewing the prohibition policy which is a symbolic bone of contention in Gujarat politics. Vaghela also indulged in various shady deals worth crores of rupees involving land, electricity generation and industrial licensing. Within the Congress, there was a move by the former JD(G) chief minister Chhabildas Mehta to share power in Vaghela ministry which was torpedoed by Solanki and Ahmed Patel as suicidal for Congress in coming polls. He also raised the issue of enough power to industry and agriculture in the state. He roped in the famous technocrat Sam Pitroda to prepare a blueprint of development in Gujarat in the next century. He declared the people of Gujarat as his only high command which used to irk congressmen of the state.

Vaghela also faced challenges from within. He failed to appease Atmaram Patel who became his opponent from within by gathering a band of 17 RJP-MLAs and played a secret role in his ouster as chief minister. As it is, Vaghela was under constant threat of withdrawal of Congress support. Vaghela's attempts to lure away BJP dissidents into RJP did not succeed and made uncertain his political survival. After being ousted, he put Dilip Parikh in his place and nursed a grudge against Atmaram Patel and the Congress. Vaghela suspected closeness between Atmaram Patel and Dilip Parikh. Vaghela committed one serious error of judgment and took a sudden and suicidal step of dissolving the state assembly on

December 25, 1997 without consulting either the Congress or the cabinet and the RJD workers. In a very dramatic fashion, he took Parikh to the governor and got the letters delivered to him, recommending dissolution of the house. He kept all his MLAs in the dark. He played a big losing gamble by holding assembly polls along with Lok Sabha polls.

The BJP was worried about one-to-one direct contest in the polls but Vaghela's adamant attitude made it a triangular contest, eventually benefiting the BJP. The Congress and RJP made grave errors of calculation. The RJP thought that it would win about 35 seats in the assembly and thereby keep the BJP out of power. This did not happen as Congress did not agree to the seat adjustment formula of the RJP. There was also a possibility of separation from the Congress, of JD(G)'s 18 MLAs.

The three main parties went to polls on different planks. BJP promised stability, good governance, end of corruption and cleansing of public life from opportunist politicians like Vaghela. Congress banked on Sonia Gandhi's popularity among the Muslims and the backward classes and promised stability in the wake of BJP's recent failure to rule the state and non-governance of RJP and corruption of Vaghela. RJP's claim was that it was a people's party and there was no 'high command' in Delhi as other parties had. Ironically the RJP was targeted by both Congress and BJP. The Congress-RJP alliance could not come through as its state chief C D Patel and AICC treasurer, Ahmed Patel opposed it. RJP was in total disarray as it could field relatively less known candidates to contest the 174 assembly seats and 23 LS seats. Congress' candidate Nanji Vakharia withdrew his candidature at Visavadar seat in favour of Keshubhai Patel. Kurji Bhesania of Congress, who had lost to Keshubhai in the earlier election, joined BJP. RJP's half a dozen ministers did not contest, fearing a rout. Vaghela along with others such as Bachubhai Sondarva in Keshod, Umesh Rajyaguru in Rajkot, etc, did not contest either LS or SA polls. From the Ashmita Rath, from where he campaigned, Vaghela churned out the achievements of his government which did not seem to impress the people. He used expensive press space to project the RJP's image. Vaghela depended on minorities, poor, and backward classes for votes. RJP's LS and SA candidates in most cases belonged to different communities.

The BJP canvassed and campaigned on the issue of electing people with clean image in public life. While doing so it projected the Congress and the RJP as the

two sides of the same coin. For the BJP, Keshubhai's first term, though short, was fondly remembered by the people as good compared to what followed it for about two years with three chief ministers and total misrule, corruption and empty boastful claims of people's support. Violence between RJP and BJP and RJP and Congress was feared and it did occur at several places. A major clash between RJP and BJP was avoided when Advani filed his nomination papers at Gandhinagar. As many as 8,000 polling booths were declared sensitive.

BJP's retaining all its sitting MLAs and MPs created a deep dissent. The hardliners and the moderates raised their voices over the issue of the image of the nominees. The selection of Jayaben Thakkar as the party's nominee for the prestigious Vadodara LS seat denied the opportunity to Jitendra Sukhadia whose name was recommended from local city and district units. But Thakkar's link with Narendra Modi prevailed in her selection. In north Gujarat's Banaskantha district, fielding of former Congress minister, Liladhar Waghela by the BJP on Deodar assembly seat created dissent. Similarly in Palanpur, nomination of Rekha Dwivedi was also resented as she was facing charges of corruption while on Palanpur municipality tenure. Her link with the Sangh parivar alone qualified her for nomination. The neighbouring Sabarkantha district also raised a hue and cry over wrong nominations in the Bayad assembly seat. Observer's proposals for nominations were ignored and the Sangh parivar links were given weightage. The hardliners of the parivar held demonstrations against re-nominations of 76 sitting MLAs. Protests were made against Vithalbhai Patel for Asarva (Ahmedabad) seat, Bharat Barot, Gopaldas Bhojwani and Kamlesh Patel. The moderates were on the whole disappointed over the nominations of Modi-loyalists and Sangh parivar members.

The remarkable thing about Congress nomination was that it perpetuated the national policy of dynastic political legacy. Bharat Solanki, son of Madhavsingh Solanki, AICC general secretary, contested assembly poll from Borsad in Kheda. Gunvaat Makwana, son of former MP and senior Congress leader Narsinh Makwana was nominated for Bavla reserved seat. Congress MP B K Gadhi's son Mukesh was to contest from Danta assembly seat in Banaskantha. Bharat Makwana, son of former union state minister for home Yogendra Makwana, was nominated for Sojitra reserved seat. The Congress list of LS and assembly nominees also caused resentments and protest. In all, Congress

nominated a total of 177 candidates for assembly and 26 for LS. Congress list contained 98 new faces below the age of 45 for assembly and 16 for LS. The caste composition of this list revealed 13 SC, 26 ST and 11 minority candidates while 76 were from OBC and 56 from upper castes. Eleven women were also nominated.

The result of assembly poll was a foregone conclusion as scales had already tilted in favour of BJP much before the poll process had commenced. The BJP won a comfortable majority of 117 seats with a vote share of 44.33 per cent. This marked an increase of 2.32 per cent vote share but a decrease of five seats as compared to its performance in 1995. The Congress won 53 seats with vote share of 35.03 per cent. The Congress' tally of seats increased by eight and vote share by 2.19 per cent over its 1995 performance. The RJP came third in its maiden contest with a measly four seats and 11.71 per cent vote share. The combined vote share of Congress and RJP came to 46.7 per cent which was higher by 2.4 per cent than that of BJP. Interestingly, the higher combined vote share of the Congress and RJP does not reflect in the same way when seats are compared. The RJP and Congress total of seats won comes to 57 which is far less than the 117 of the BJP. The Janata Dal in its new avatar (after its earlier merger with Congress by Chinanbhai Patel) won four seats and 2.66 per cent votes. The independents polled 5.47 per cent votes and won only three seats as compared to 18.71 per cent votes and 16 seats in 1995. Their role in 'majority-making' for an ambitious faction of a dominant party seems to have annoyed the state's electorate. The Congress was runner-up to BJP with 95 seats and RJP followed with 21 seats. The biggest and the narrowest victory margins were recorded in Ahmedabad. Ellishbridge seat, where Haren Pandya of BJP defeated Congress' Harin Raval by 64,520 votes, recorded the biggest margin. Kalapur seat, where Farooq Shaikh of Congress won by 398 votes by defeating B Khatri who had earlier been elected twice in succession was the lowest margin. Some stalwarts of both the parties suffered losses. Congress' Prabhodh Raval and CDPatel lost in Asarwa of Ahmedabad and Jalapur of Valsad respectively by slender margins. The BJP won 13 seats in the margin-bracket of 300 to 5,000 votes. Dilip Parikh of RJP lost by 15,890 votes in Dhandhuka. Nalin Bhatt of BJP lost in Padra (Baroda) by 4,749 votes. Thirty-six candidates of Vaghela's RJP lost deposit in Saurashtra alone.

After the poll, Congress and RJP blamed each other for the failure to strike a poll

alliance and understanding. RJP however claimed that it changed the agenda of political discourse from religion and hindutva to poverty and development. Regionwise, Saurashtra and Kutch continue to be the stronghold of BJP. Of the 65 assembly seats, the BJP won 58, Congress five, RJP and independents one each. In Kutch, BJP won five of the six total seats. It won all the eight LS seats in the region. Such reputed congressmen as Sanat Mehta, Shaktisinh Gohil and Chhabildas Mehta lost to the BJP in Saurashtra. In central and south Gujarat the Congress performed better. The LS seats of Kheda and Anand were retained by Congress, whereas Baroda seat was lost to BJP. Of the 13 seats in Baroda, the Congress won seven and five went to the BJP. Chhotaudepur reserved tribal LS seat was retained by Congress. In south Gujarat, the BJP managed to retain its Bharuch, Surat and Valsad seats. Mandvi ST seat could not be snatched from Congress as Chhitubhai Gamit held it for the seventh time in succession, though with a declining margin of victory. From a total 28 seats in the region, Congress had won only five in 1995 but this time its tally rose to seven. Congress was runner-up to BJP in 18 seats apart from the seven it won. Congress can improve its performance in this region. Bharuch and Valsad were particularly focused by BJP as it had unleashed Sadhvi Ritambhara and Pravin Togadia for aggressive campaigning there. Despite this, Bharuch was retained with much lower margin. This time voter turnout drastically improved. In 1995 assembly poll, 64.39 per cent voting was recorded whereas in 1996 LS poll it had slumped to a historic low of 35.9 per cent. In 1998 poll it sharply rose to 59 per cent.

In order to get an insight and understanding as to who voted whom, we used the analysis of data yielded from post-poll survey of LS. Table 6 shows that in Gujarat, the voting age group of 26-45 years constitutes 52.7 per cent of the total voters. Secondly, as can be seen the BJP is popularly placed among all age groups. Regarding genderwise performance, about 60 per cent males have preferred BJP and 56.5 per cent female voters have voted for BJP. Educationwise voters' party preference shows that illiterate voters seem to prefer the Congress more, as the gap between the preference percentage is less between Congress and BJP than in other categories. BJP primarily continues to be the party of middle and upper classes as 84.6 and 61.1 per cent college attending, graduates and above voted for the BJP. Of high school educated voters, 63.6 per cent chose the BJP. If we see party preference by occupation, again the same pattern repeats here as in the parameter of education. Seventy-five per cent white collar professionals voted for the BJP. The peasantry seems to have fully backed BJP as 61 per cent cultivators voted for the BJP. Congress is preferred to BJP by a difference of about 5 per cent by unskilled workers. If we see castewise preference, we find that the SC vote in Gujarat is almost evenly divided between the BJP and the Congress as 47.5 and 45 per cent voted for the two parties respectively. Congress has reportedly higher ST preferences - 46.3 as against 42.6 per cent for the BJP. The OBCs with 69.4 per cent are with the BJP whereas Congress and RJP has 29.5 and 14 per cent share of OBC votes in Gujarat. Religionwise party preferences show that 40 per cent Muslims have voted for BJP whereas 60 per cent have voted for the Congress. Among the

Source: Data from post-poll survey

Hindu votes, 59.7 per cent have gone to the BJP and 28.4 per cent to the Congress as reported in the survey.

The post-1998 BJP in Gujarat is quite free from any pronounced factionalism of the type and intensity which was witnessed between September 1995 and September 1996. However, the Keshubhai Patel-led BJP government is not free from internal squabbles, discontent and factional infighting. There are tensions across various poles ranging from routine to exceptional. There is a well known, proverbial almost, tension between the Suresh Mehta-led, liberal and democratic faction versus militant, ruthless, fascist Sangh parivar led by Pravin Togadia and chief minister himself. On caste count, there are tensions between patidars or patels and kshatriyas on the one hand and between the kadva and leva patidar or patels in Saurashtra on the other. These tensions have periodically erupted. In one such eruption, former chief minister, Suresh Mehta was insulted, mobbed, hooted down and attacked in a public function by Sangh parivar cadres in Saurashtra.

The BJP's failure to stem the factional rot within had resulted in a split in 1996.

The fact that a disciplined and committed party like the BJP can also go the Congress way when it comes to power had shocked the people of the state. Unless the BJP learns to strike an equilibrium among its hardliner and moderate contenders and claimants of power by being more flexible, amenable and liberal, it will keep winning and losing future electoral battles and waste the popular mandates. The caste factor is here to stay. But the hindutva card does not seem to have become redundant. It has so far proved successful in cutting across various caste identities at lower, middle and lower levels of caste hierarchies but if it continues to fail in rewarding the voters tangibly, its efficacy is bound to decline. However, from gradual to sudden rise of the BJP in Gujarat in the 1990s, its quick split into khajoorias and hazoorias, decline in 1997, re-emergence in 1998 and again indication of its decline in 1999 are quite unprecedented as in no other state has it tasted the sweetest and the bitterest fruits of political success and failure, rise and fall within a span of three years as in Gujarat during 1995-98. The state electorate has occasionally and positively responded to the economic issues raised here and there but not in any very

significant way. On the other side, the victorious ruling BJP has to ensure the conversion of its religious mandate into economic gains for voters. After all, basic human needs ride over all other considerations, including religious factors and they emerge as a litmus test of good governance and any regime's survival. Issues of providing work and water, sufficient power, health care, food, proper wages, tackling corruption, crimes and exploitation of vulnerable sections of society will acquire primacy and salience in state politics in the near future. Besides, the minorities of the state need special consideration which is possible only through an electoral mobilisation along a secular axis, as they have been terrorised in Gujarat like in a fascist-like regime. The record of human rights in the state is abysmal. A human rights commission at the state level needs to be set up urgently. The hindutva hardliners in BJP have to be checked either from within or from without the BJP by a reconfiguration of social support bases of the parties. Any political party in Gujarat that intends to take the reins of governance in hand will have to respond to these questions positively and urgently.

ACTIONAID™

ActionAid, an International Non Governmental Organisation with headquarters for its India programme in Bangalore and Zonal/Regional Offices in different parts of the country seeks to expand its human resource base.

PROGRAMME OFFICERS - VARIOUS OFFICES

The Programme Officer plays a crucial role in ActionAid's work. S/he is responsible for identifying and appraising NGO partners, supporting their work and monitoring progress.

Applicants must have at least three years experience in planning and managing development projects. Those with grass-roots experience will be at an advantage. A Post-Graduate degree in Social Sciences/ Management and with high degree of communication and computer skills desirable.

MANAGER - INFORMATION SYSTEMS - BANGALORE

The incumbent shall manage the organization's Information Systems unit and be responsible for operationalisation of ActionAid's Information Technology and Information Systems Strategy, assessment, procurement and management of Hardware and Software Systems (including documentation and user training and support) as per agreed standards and protocols, development and management of ActionAid's computer based Management Information Systems, utility software systems for effective management of its development projects and ActionAid's internet and intranet web-sites.

The candidates should be Post-Graduates in Computer Science, Engineering or Management, with at least 5 years of relevant experience preferably of which at least 2 years should have been in a supervisory/managerial capacity. They should be well versed with the latest in Information Technology, Information Systems and knowledge management. Expertise in Unix is essential.

SENIOR POLICY & ADVOCACY PERSONNEL

The incumbent will be responsible for coordination of policy research and analysis, conceptualising and coordinating advocacy campaigns, assisting the organization in providing inputs for micro-finance linkages, in drawing up and prioritising the advocacy agenda for the organisation, assisting in building research and advocacy capabilities and mainstreaming advocacy work at various levels in the organisation.

Applicants must have a Post-Graduate degree in a Social Science discipline with at least 5 years experience in policy analysis and appropriate research work. Those with grass-roots experience will be at an advantage.

Applicants for all the above posts should have good communication skills (both written and oral) in English and working knowledge of Hindi. (Applicants for the post of Programme Officers should also have good knowledge of at least one local Indian language.) Applicants should be prepared to be relocated to any of the offices in India, if necessary. Familiarity with the Voluntary sector would be an advantage. Women candidates will receive preference. All the above jobs involve extensive travel. Salary will be commensurate with experience.

Applications should be sent, within 10 days, to :

The Personnel Officer, ActionAid India, P.B. No. 5406, #3, Rest House Road, Bangalore -560 001.

Pragmatic Politics in Goa, 1987-99

Peter Ronald deSouza

The past two assembly terms in Goa were dominated by defections when MLAs left one party and joined another without facing the electorate again. This politics of pragmatism makes party ideology almost irrelevant. But voters do support parties on the basis of their policies. The MGP has not been able to translate its 'bahujan' ideology into votes and seats. The BJP has offered a softer version of hindutva than elsewhere in the country, but has not found many takers. The Congress is in a relatively strong position, but voters are unhappy with its unashamed practice of 'pragmatic' politics.

A review of the past 12 years of politics in Goa will allow us to move beyond the tumult of the moment to a study of the patterns which emerge, to a deeper evaluation of political events, issues, trends, and personalities. When these 12 years are read not as a series of moments but as the *longue duree* of a society, some interesting questions concerning the politics of democracies emerge. In this essay I shall stand back from the tumult of these 12 years and try and find, amidst the din and dust, something of significance.

I Introduction

The story begins with the attainment of statehood on May 30, 1987. From a union territory with an assembly comprising of 30 members the new state has now an enlarged assembly of 40 members, a change in numbers symptomatic of the increasing power of the state. This shift has consequences for the different domains of social life. In the economic domain, for example, the state has now to be fiscally more independent since it is less able and eligible for grants from the centre. This has resulted in a decline in state development expenditure [D'Souza 1997: 17]. The shift has also had symbolic consequences, in that now the citizens of Goa are on par with the citizens of other states in their ability to select their president and to decide their own futures. It has also had political consequences in that statehood has given greater autonomy to the political leaders thereby reducing the *de jure* power of the central bureaucracy and of the lieutenant governor. Decisions concerning items on the state list can now be taken in Goa and do not need the approval of the bureaucracy in Delhi as had been the case earlier under union territory status [Rubinoff 1998: Ch 5]. These consequences – economic, symbolic, political – have taken place during a period of dramatic changes in national politics; changes which, when read together with changes at the state level, present a picture of politics in Goa that is fairly complex. Let me elaborate.

In addition to the usual issues of agriculture, mining, transport, industry, unemployment, etc., that impact upon politics, the issues that need to be noted, if not analysed, with respect to their significance for state politics in the years 1987-99 are the following: (i) the transformation of land from a tool in the production process into an alienable commodity in an emerging market in and for land; (ii) the growing role of tourism in expanding the contribution of the services sector in the economy [Sawkar et al 1998], and in itself effects on identity politics; (iii) the demographic changes brought about by, immigration and emigration and the consequences of this migration for political and social life; (iv) the controversies centring around large development projects such as the Konkan Railway and the proposal for a free port, with respect to their irreversible impacts on Goa; and (v) the expansion in the size of the state bureaucracy as a result of which there is one government official for approximately every 26 citizens, making the state a rent-seeking rather than just an enabling state. I have thought it fit to foreground these five issues here because the dynamics of party and electoral politics in Goa have in considerable measure been influenced by them.

However, before I get into an analysis of the politics of the period, let me say something especially about the market in land because of the enormous impact it has had on the politics of this period. My comments will be in the nature of a series of propositions, a potential research agenda perhaps, since unfortunately there is little systematic study on this issue on which I can draw. I should like to begin by stating that the most significant factor in this decade of politics is the dramatic change in the status of land. Whereas earlier the value of land was assessed in terms of its contribution to agriculture now it is assessed in terms of its worth as a tradable commodity. A new group of players has emerged in this market in and for land, the most significant of which is the political

class of bureaucrats and elected representatives. The growth in this market has been because of the role of many actors eg, builders, landlords, tenants, politicians, each of whom has a stake in the network of transactions. The dynamics of this market has as yet not been mapped in terms of (i) the interests and strategies of each actor; (ii) the monetary volume of the transactions in the sector; and (iii) its contribution to the economy. But suffice it to say that it is very large as can be gauged from the changing physical landscape of the towns and beaches of Goa.

These transactions are further strengthened by the expansion of the tourism industry. Some of the instruments that the industry has developed for raising capital, such as the 'rent-back facility', where builder, hotelier, house-owner, and regulatory agency collude to create large properties in tourist sites, strengthen this market in land. Since all these activities involve getting many government permissions, covering the whole range from planning permissions to occupancy certificates, to loans from the Goa Economic Development Corporation, a state owned entity, the politician and bureaucrat become key figures in the various transactions involved. Further, since these transactions involve large sums of money, and since they constitute one of the major economic activities in the state, the political economy of government in Goa has begun to be constituted around this market in land. Goa has also emerged as a society with a significant middle class who bring new meanings to politics. They like to see politics as spectacle. I have made mention of this class here because its internal dynamics has significance for politics, particularly democratic politics.¹

The foregoing is a profile of a society undergoing change at many levels, and as a result of many forces, some of which are government induced, some of which are because of other agencies. The parameters of this change is vigorously contested on every plane, cultural [Angley

1999], environmental,² economic,³ social and of course political. This last is the theme of this paper which I shall examine a little later. Before I do so, however, I need to locate this reading of politics in Goa within the larger frame of Indian politics. Doing so is necessary because the process of linking up with the larger Indian polity shows impacts of the larger on the smaller which are both, direct and delayed, superficial and more enduring.

Three aspects of these linkages could perhaps be mentioned here to illustrate the point. The first is the culture of party politics in Goa. Party politics has acquired the same internal logic, perhaps through imitation, as party politics at the central level in terms of palace intrigue, factions, the authority status of the high command, the etiquette of subservience and sycophancy, and most significantly the blurring of the distinction between the personal and the public. The second is the centrality of politics to daily life, not just in a removed sense of 'everything is effected by politics', but in a more immediate sense of politics as spectacle, of a curiosity to know about the latest episodes in the long running and popular political drama. A measure of this centrality is the fact that Goa supports eight daily newspapers in three languages. The third aspect is the political cultural impact of the mobilisation around the demolition of the Babri masjid. This mobilisation has affected the way the

communities have constituted themselves, an observation that will become more apparent when we look at election results of the last decade particularly the rise of the BJP and the decline of the MGP.

The preceding elaborate prefatory note is intended to provide the perspective within which the high stakes that parties and politicians play for and that will be discussed in the following pages can be understood. The market in land is the text within which the actions and choices of political agents can be understood. This must be borne in mind when I discuss the politics of the period. My reading of the changes at the surface level of politics must be seen in terms of its base in the political economy of land. I will discuss the politics of the state in three sections: (i) the changes in the institutions of the polity; (ii) the trends within party organisations and the party system; and (iii) the emerging electoral landscape. Since elections are a sort of diagnostic tool for examining the state of the polity, this last section will help us understand better the consequences of the interaction between the domain of society and that of politics.

II

Changes in political institutions

An analysis of the experiences of political institutions in these twelve years establishes one clear fact, that an aggressive and aspiring political class, made up of different

segments, has emerged which has taken possession of political institutions and begun to fashion them after its own interests. The extent of this fashioning will depend upon the tension between the flexibility and resilience of the institution, flexibility to accommodate interests/directives, and resilience deriving from the logic of its rules beyond which it cannot go. The agency of this political class, brought in through individuals such as faction or party leaders, eg, Churchill Alemao, Ravi Naik, Ramakant Khalap, Manohar Parrikar, Wilfred D'Souza, Luizinho Falcão, or through groups such as Bahujan Samaj, Kshatriya Bhandari Samaj, the Catholic Church, and through the cultural perspectives within which they are located, begins to cause a strain on institutions which now have to negotiate a balance between the 'public interest', ostensibly expressed through their impersonality, and the 'particular interests' represented by the interventions of the political class. The outcomes of this struggle between the two interests can be seen as the episodes and events that make up the history of our institutions, in this case those of Goa during the years 1987-99. Let me illustrate with a few cases.

Let me begin with the institution of the legislature. Let me draw attention to some of the significant events that occurred during the period under review when the assembly completed two terms (1989-94

TABLE I DEFLECTIONS AND THE OFFICE OF THE SPEAKER

Speaker	Period	Political Party	Date of Defection/ Split	Petitioner	Against Defection/	Petition filed	Judgment given	No of Months	Verdict
Luis P Barbosa	22/1/90-14/4/90	Cong

and 1994-99), the third just begun in June 1999. The most repetitive aspect of this period was the act of defection when MLAs left one party and joined another without resigning and facing the electorate. Regardless of the constraints of the 52nd amendment, members, after elections, saw politics only in terms of their personal short-term interests and, therefore, unconstrained by party ideology changed sides quite often establishing firmly the politics of pragmatism [deSouza 1998]. Such pragmatism appears to have a considerable elasticity.

The data in Table 1 give us a synoptic account of the movement between parties of defectors, the role of the speaker, the time taken to pronounce judgment during which the defector continued to enjoy parliamentary privileges and in some cases even the exercise of power. It is a picture of the new culture of pragmatic politics that is emerging.

The next interesting aspect of the period is the 10 changes in government in these two terms indicating that the assembly developed an autonomy of its own with its 40 members willing and able to work out, short-term coalition combinations arrived at through constructed legislative majorities. Election opponents became allies and allies traitors [Fernandes 1997]. The frequent changing of coalition partners, and the lingual acrobatics that were employed to provide justifications for it, has resulted in the moral cement of society suffering severe erosion. The domain of public morality lost its ability to deter public men and women from transgressing the limits that underlay the ethics of representation, that constituted the evolved codes of political behaviour in a representative democracy. Not one MLA, during these 12 years, thought fit to get an endorsement from his voters for these shifts in association. Nobody resigned and sought re-election. While the initial defections caused some outrage, resulting in the voters punishing defectors in the 1994 elections, its continued occurrence dulled public morality with most of the habitual defectors returning in the 1999 elections. The only democratic code that seems to have retained some force is majority rule within the assembly. All else was negotiable. During this period seven governments lasted for less than one year, one less than two years, and two more than two years. One government lasted two days (Table 2).

These changes in government in some cases also involved changes of speakers who, empowered by the 52nd amendment to the Constitution, the Anti-Defection

Act, acted in a blatantly partisan manner deciding on the legality or illegality of defections on the basis of whether the defectors were changing over to the speaker's party. In some cases these decisions were taken in a matter of days in some cases months (Table 1) making a mockery of the spirit of the Act [deSouza 1998a]. In one case a member (Kashinath Jhalmi) appointed under the 52nd amendment to decide on the legality of the speaker who defected to become chief minister, served, during the period of the decision, as the law minister of the very same chief minister. The office of the speaker lost its high status as an office impartially regulating the discursive dynamics of the polity. It came to be seen as an office that is purchasable not earned. These defections resulted in jumbo cabinets with the number of ministers growing to 14 in a house of 40 members.⁴ Since members from the opposition, in alliance with factions from the ruling group, formed new governments, one could reasonably argue that during an assembly term, particularly 1989-94, many members in the legislature, because of jumbo cabinets and repeated defections, became members of the executive thereby undermining the doctrine of separation of powers between the executive and the legislature, an important principle of a democracy [deSouza 1998b:8]. The principle of collective responsibility also faced erosion since members from an earlier cabinet joined the following cabinet, which was formed through defections, and in their justifications challenged the integrity of the cabinets they had just left. These happenings in the assembly have shown (and no political party is exempt from this charge) that the moral force of the concept of the 'laxmanrekha', the limiting codes constraining behaviour in a democracy, is very weak in Goa.

During this period the institution of the governor also came under a cloud. Governor Bhanu Pratap Singh had to resign because of his dismissal of the Wilfred D'Souza government without consulting either the president or the majority group in the legislative assembly thereby violating the letter and spirit of article 16(4) of the Constitution. Further, this political competitiveness between groups brought the courts into the picture requiring them to now resolve issues of defection within the legislature. This is an undesirable development since it weakens the doctrine of separation of powers and sovereignty of jurisdiction. Now matters of defection, and the decisions of the speaker, because of the slovenly way in which they have been handled, have got linked to issues

of 'due process' and 'natural justice' [D'Mello 1994] making them thereby eligible for judicial review.

In contrast to these negative trends, however, the institutional topography of Goa also witnessed some positive developments. Since the 73rd amendment gave the third tier of government constitutional status. The Conformity Act in Goa also incorporated some of the provisions. As a result one-third of the seats in the 182 panchayats were reserved for women. Many new faces entered the political system generating a new dynamism and extending the range of representation. The panchayati raj institutions are in their early learning and have exhibited characteristics of collusion and competition with vested interests and dominant groups.

III

Trends within Party Organisations

There are five major players in the party system. The first is the Congress which I will call the 'dominant party', in a sense akin to Rajni Kothari's classification, since it sets the terms of party competition and since all the other parties develop their strategies in relation to it, or owe their existence to it. The second, in terms of its salience (although declining) during this period, is the Maharashtrawadi Gomantak Party (MGP) which has developed a peculiar master-slave relationship with the Congress. The third is the Bharatiya Janata Party (BJP) which has grown by cannibalising the MGP with which it once had a relationship, converting a vote bank that was rooted in a strong bahun ideology into one that can perhaps best be described as soft hindutva. The fourth and not insignificant group is the small, local, personality based parties such as the United Goans Democratic Party (UGDP) and the Goa Rajiv Congress Party (GRCP)⁵ who have the ability to win a few seats in the assembly and who, again to borrow Rajni Kothari's terms, can be described as parties

TABLE 2: DURATION OF CABINET GOVERNMENT

Chief Minister	Period	Duration
Churchill		
Alemao	March-April 1990	17 days
Barbosa	April-Dec 1990	9 months
Ravi Naik	Jan 1991-May 1993	28 months
Willie	May 1993-April 1994	16 months
Ravi Naik	April-April 1994	2 days
Willie	April-Dec 1994	8 months
Rane	Dec 1994-July 1998	48 months
Willie	July 1998-Nov 1998	4 months
Luizinho		
Faleiro	Nov 1998-Feb 1999	3 months
Luizinho	since June 1999	since June 9

of pressure with respect to the Congress. The fifth significant group is the independents who have, as in the 1989-94 assembly, sometimes held the balance of power. It is the dynamics between these five players which sets the character of the party system.

Of all the above it is the Congress that best exemplifies politics of pragmatism. This is evident in its success in accommodating opposed factions, in its converting into a fine art the practice of expelling and re-admitting politicians who had left the party bringing down its government on several occasions,⁶ in its stressing winnability rather than venality, in its manipulation of the election of the speaker,⁷ in its splitting of opposition parties especially the MGP and the UGDP,⁸ in its expansion of the cabinet and appointment of MLAs to 'lucrative' posts such as the chairmanships of the two planning authorities and of the Economic Development Corporation, etc. These are just some of the practices of the Congress which have ensured its dominance during the decade, except for brief periods when large sections left to form GPP (Alemão and others 1990) or GRCP (Willie and others 1998) (see Table 1). More than any other party the Congress has demonstrated an ability to manage dissidence in that it has even got implacable enemies to work together. In the 1999 cabinet, for example, Faleiro has managed to have both Ravi Naik and Churchill Alemão in the cabinet even though it was Naik who had imprisoned Alemão and proceeded against him when he (Naik) was chief minister. This success is because of a dual strategy of invoking the 'mind' of the high command, which few ambitious Congressmen would like to go against, and of tactically being one step ahead of the dissidents. Faleiro in 1999 has succeeded so far in curbing open revolt by having Rane as speaker, thereby holding the threat of disqualification over any dissidents, by accommodating major faction leaders within the cabinet, and by making regular trips to meet Sonia.

The MGP is a party with its eyes on the past. Unlike the Congress it had a mass base across most of Goa, based on its bahujan ideology, (I will discuss this later when I discuss the vote) and a fairly strong network of local leaders and followers which it has succeeded in frittering away. Unlike the Congress, the MGP has not had the capacity to manage factions and hence has bled regularly. Factions have left and joined the Congress. Ravi Naik, Narvenker, Wilfred Misquita, all felt that it would be better for their interest, and that of their

constituency, if they bargained their way into the Congress. The time horizon of most of these politicians is just one assembly and hence, when they saw themselves in the opposition, they strove to become members of the ruling party by defecting from the MGP to the Congress. As a result the politics of the palace replaced the politics of social classes, within which the MGP was earlier rooted because of its bahujan ideology. The MGP has also suffered because of poor organisation skills, because of a paucity of funds (unlike the Congress) since it has been in opposition for too long and dominant interests which depend on the goodwill of the state such as the mining lobby, or the industrialists and builders do not contribute in large numbers to its coffers. Another factor that has probably led to an erosion of the MGP social base is the immigration from other parts of India, a demographic change that favours national parties especially since this migrant population is concentrated in certain constituencies. It is estimated to be over 20 of the total population. The final factor that has compounded the MGP's woes is the cannibalising of its mass base by the BJP with which it had aligned in the 1994 assembly elections when it tried to consolidate what it perceived to be a cohesive Hindu vote. The strategy did not succeed (Table 4).

The BJP is a new party in Goa and has grown significantly from 0.47 of the assembly vote in 1989 to 26.19 in 1999. The BJP has succeeded by presenting itself in multiple ways (i) as an alternative to Congress – a picture which has found some appeal especially among the middle class disgusted by the politics of defection and pragmatism represented by the Congress (even Catholics in some constituencies voted for the BJP); (ii) as a soft hindutva party which has enabled it to poach on the MGP vote bank and to attract those who have a communal ideology; and (iii) as the state representative of the government at the centre. It has benefited from the Vajpayee and the Kargil factor where the BJP has got considerable media mileage. Its organisational strength

comes from its close links with the Sangh combine particularly the secretive RSS. These have so far been inadequately probed and so the extent of control by this extra-constitutional authority, the remote control mechanism, is not properly understood. Its leader Parrikar has been able to portray himself as an alert and aggressive 'leader of the opposition', a title which the party has now wrested from the MGP. When I disaggregate the votes of the last three assembly elections, I shall comment on the character of its social base and on its potential to challenge the Congress as the party of governance.

The smaller parties such as the UGDP, GPP, GRCP came into existence because of the political manoeuvrings of their leaders – Alemão, Barbosa, Willie, etc. They have no ideology, no potential to dethrone the Congress. They apply pressure on the Congress since they draw their support from the Congress vote base. Most of them are located in areas where the Congress is strong and have no potential to threaten the BJP or MGP. In fact they have formed governments by forging alliances with the MGP and BJP (Table 2). They achieve as groups what independents achieve as individuals which is to apply pressure on the Congress and to create the conditions for their merger or admittance into the Congress. The vote base of this

Note: P= Parliament; A= Assembly.

group is sizeable since it contains the protest vote against the politics of Congress which through the period has been in excess of 19 per cent of the vote (Table 3). These broad trends that I have identified do not convey (i) the importance of power brokers; (ii) the intensity of constituency level competition; (iii) the role of personal charisma; or (iv) the differences in voter preferences between new and old voters, men and women, urban and rural, educated and illiterate, etc. It does not illustrate the social profile of the vote. Table 3 presents a summary of aggregate votes polled and seats won by each party and gives a sense of the strengths of each group. The small parties and independents have been clubbed together.

IV Electoral Landscape

During this decade the most significant aspect of the electoral landscape has been the rise of the BJP, the decline of the MGP, and the spirited continuance of the Congress. In this section I shall not do a dissection of each assembly and each parliamentary election, since there are too many particularities to each and these do not lead up to or contribute towards a trend [for details see Fernandes 1997]. For example the 1994 assembly election was a protest vote against the politics of defection when 19 new members, many independents, and some small parties, were elected in the place of many stalwarts such as Ravi Naik, Sardinha, Sheik Haroon Hasan and Khalap [deSouza 1996]; or the 1996 parliamentary elections when the Congress lost both seats one to the MGP and one to the UGDP; or the 1998 parliamentary elections where they won both back. There were too many contingent factors unique to each election for us to be able to derive a trend by focusing on them. The significant feature of the 1989 election was the tie of 18 seats for both Congress and MGP, that of 1994 the alliance of BJP-MGP to consolidate the Hindu vote⁹ which instead got further fragmented since the MGP got less than it had in 1989, and that of 1999 the return of many of the party stalwarts who had been punished in the 1994 elections. Instead of looking at episodes or contingencies I shall look at aggregate voting figures to see if there are any significant trends emerging that have implications for the polity.

I shall divide Goa into four regions north new conquests (NN), north old conquests (NO), south old conquests (SO), and south new conquests (SN) which were impacted differently by Portuguese rule. In the old

conquests, Portuguese rule extended to over four centuries whereas in the new conquests it was for less than two centuries. This resulted in a demographic concentration of the Catholics in the old conquest areas. These are also the more developed regions where the population is more mixed and in which most of the big towns are located. This means that singular appeals are unlikely to produce results since the interests of one group are unlikely to harmonise with the interests of another group. The ideological politics of the BJP is likely to exclude groups which the pragmatic politics of the Congress is likely to accommodate. Hence the Congress, seen as a party of factions, always under internal stress, in contrast to the BJP, whose internal politics remains largely unreported and hence unknown, has a greater chance of forging a electoral majority. In these regions the division of assembly seats are as follows: NN – 12, NO – 11, SO – 11, and SN – 6. Table 4 gives the regional profile over the three assembly elections.

A study of Table 4 reveals three interesting trends. The first is the obvious one of the BJP's growth at the expense of the MGP, a shift in the ideology of the social base from strong bahujan to soft hindutva. The BJP has gained because of the vote against Congress misrule; because the MGP has been unable to present itself as an alternative to Congress, since its important leaders have, post-election, gone and joined the Congress; because of the absence of any alternative to Congress; and because of the Vajpayee factor. This growth has been remarkable in all regions even SO, and strongest in NN which had been the bastion of the MGP in 1989. The MGP has declined in all regions dropping from an aggregate of 39.52 per cent in 1989 to 14.03 per cent in 1999. It remains to be seen whether this is a terminal trend, and whether soft hindutva can replace strong bahujan the former being only a community based ideology whereas the latter ideology has characteristics of both class and caste. It also shows that the hindutva line has made inroads into the strong bahujan, social base even though only in a soft form because its more strident version, espoused by members of the RSS combine such as the Bajrang Dal and VHP after the demolition of the Babri masjid, has few takers in Goa. Alternatively one could ask whether the failure of the MGP lies more at the level of logistics, such as party organisation, poor campaign, inadequate resources, a failure which can be remedied through new leadership restating the bahujan ideology which has

an independent existence and which is experiencing a resurgence in other parts of India. The future of the MGP will be decided by the vision of its leaders.

The second important trend is the bargaining position of the independents and the other smaller parties. The vote of 19.5 per cent in 1989 going up to a high of 33.46 per cent in 1994 and steadying at 21.21 per cent in 1999, shows that there are some leaders who have localised support and who can and have used it to gain positional advantage for themselves either as ministers or as chairpersons of corporations. This is where the GRCP and UGDP, and some independents have the power to be spoilers. They are largely located in the old conquest areas especially SO. They have little influence in NN. This sizeable vote shows that there is a large floating voter group which is searching for a new practice of politics. It gets focused either through a charismatic leader such as Churchill Alemao in 1996, or a localised party such as the UGDP in 1994, to register their disaffection with the Congress. This floating voter represents the search for 'good governance' which the Congress is not seen as providing, and which the electoral system does not seem to offer either. The consequence hence is to apply pressure on the Congress by voting for what I referred to earlier as the 'parties of pressure'. This is not a vote that will go to the MGP or the BJP since it is essentially a secular vote.

The third important factor, paradoxically, is the continuing consolidation equally in all the regions of the Congress. While the defection factor may have benefited the BJP, in that a population that believes that the voting calculus should be driven by principles voted for it in disgust against the Congress, it also helped the Congress in that it gained new supporters brought in by those who had defected to it. The Congress seems to have maintained a steady support base across all three assembly elections and in all the four regions. This is significant because if it can retain its hold over SO and NO, as it appears to have done, because of the anti-communal and thereby anti-BJP vote, and because of the more mixed populations of these areas, then it can continue to be the party of governance because these regions may have been willing to vote for the MGP because of its bahujan ideology but not for the BJP because of its hindutva ideology. The BJP therefore faces a glass ceiling beyond which it cannot rise. Defections therefore have a double impact on the Congress, depleting and replenishing its support base. It helps the Congress

to retain its mixed, secular character. So even though Congress rule has meant instability, because of defections, during election time the Congress benefits because the alternatives appear less desirable especially to populations in SO and NO. In addition to this the Congress benefits from political leaders who have considerable skill in managing elections and who have large war chests. Politics is good business for the Congress, in some cases a family one. The Congress dominance shows that pragmatic politics gives better dividends than ideological politics.

The foregoing has shown that politics in Goa seems to have developed a considerable autonomy in that the actions and decisions of groups and leaders are hardly constrained by either the rules that govern institutions or the moral codes that underlie democratic politics. The mechanisms of accountability which is democracy's chief virtue also do not seem to deter this class of political leaders since, in the decade under review, they seem to have worked out strategies to overcome them. The examples of defections, of the role of the speaker, of winnability in elections are cases in point. The managing of elections and of defections has become the key to ensuring a continued capacity to govern. The Congress leads in this capacity. This is still a long way off from democratic governance. The Congress, and the others, lack this capacity.

Notes

[I should like to thank Adi H Doctor for comments and Alito Siquiera, Aureliano Fernandes, Venecia Cardoso, Santosh Vernekar, Mohan Mangueshkar for assistance with data.]

1 Some data on Goa

- (i) per capita net state domestic product at current prices in 1998 Rs 19,719;
- (ii) per capita bank deposits in 1998 Rs 41,380;
- (iii) birth rate per 1,000 of population in 1998, 17.97;
- (iv) death rate per 1000 of population in 1998, 7.54;
- (v) literacy in per cent in 1998, males 83.64, females in 1998, 67.09;
- (vi) roads per 1,000 sq km of area in 1998, 2038;
- (vii) urban population to total population growth (per cent) 1987=32.03 to 1998=41.01;
- (viii) agricultural workers to total workers (per cent) in 1998, 23.94;
- (ix) per capita domestic consumption of electricity 1987= 77.39 to 1998= 208;
- (x) motor vehicles per lakh of population 1987=7,876 to 1998=22,483;
- (xi) population served per hospital in 1998, 10,662.

2 The discussion on the Konkan Railway is a case in point. See the note prepared by the Citizen's Committee titled 'Summary of Main

Issues/ Arguments Related to the Konkan Railway Route Alternatives', (May 19, 1993) where the pros and cons of the three routes are presented in terms of costs, environmental impacts, safety, and development consequences.

- 3 The proposal to convert Goa into a free port raised a host of issues. The presentation 'Understanding the Environmental Implications of a Free Port for Goa', January 10, 1998 by Ligia Noronha at the International Centre, Goa sets clearly the agenda for such a debate.
- 4 Jumbo cabinets became an election issue in 1999 resulting in the Congress giving an assurance that the cabinet size would not exceed eight.
- 5 Some other parties are: (now defunct) Goan People's Party (GPP) and Gomant Lok Poxx (GLP).
- 6 Narvenker, Alemao, Shirodkar, Willie, Mauvin are just some of the regulars.
- 7 In 1994 the Congress had the speaker protest manipulate the secret ballot to declare a tie and then cancel it and use the method of a voice vote to elect the speaker Tomazinho Cardozo.
- 8 There are many instances of this in the last decade in 1994 Wilfred Misquita and some others left the MGP and joined the Congress, in 1999 Parulekar and Jose Philip left the UGDP to align with the Congress.
- 9 Since the MGP has its base in the bahujan Hindu vote and the BJP in the saraswat Hindu vote it was felt that an alliance would consolidate the Hindu vote, an argument that overlooks the internal contradictions of caste and class within the Hindu community.

Twilight of Congress Hegemony

Emergence of Bi-Polar Alliance System in Karnataka

Sandeep Shastri

After its dismal performance in 1996, the Congress attempted to widen its support base among the OBCs and the minorities and is now projecting itself as the 'natural' choice of the electorate. With the splitting of the Janata Dal, the state is likely to witness bi-polar contests between the BJP and its allies and the Congress.

THE verdict of the Karnataka voters in the 1996 and 1998 Lok Sabha elections is significant for several reasons. The twilight of the Congress hegemony was witnessed in Karnataka in the 1996 Lok Sabha elections, with the Janata Dal winning 16 seats and the BJP emerging victorious in six constituencies. The Congress was relegated to the third position with only five seats. In 1998, the Janata Dal was pushed to the third position winning only three seats. The BJP/Lok Shakti alliance secured 16 seats and the Congress increased its tally to nine seats.

Prior to the 1996 elections, the Congress Party¹ had, in all previous elections save the one in 1967 secured more than 80 per cent of the Lok Sabha seats in the state. Even in 1967 it had secured two-thirds of the total number of seats. This time around, party nominees were elected in less than 20 per cent of the seats (five seats). For the Janata Dal,² its best ever performance in earlier elections was in 1984, when it won 4 of the 28 seats (14 per cent). Having failed to register even a single victory from the state in the 1991 elections,³ the party's performance in the 1996 poll was commendable, as it won as many as 16 of the 28 seats (57 per cent). The BJP won its first Lok Sabha seat from Karnataka in the 1991 Lok Sabha elections when its candidates emerged victorious in four of the 28 seats (14 per cent). In this election, the party marginally improved upon its earlier performance by winning six seats (21 per cent). The Karnataka Congress Party (KCP) registered its presence in the Eleventh Lok Sabha, by winning one seat. The party later merged with the Congress.

NATURE OF POLITICAL COMPETITION

An analysis of the Lok Sabha election results in Karnataka, prior to the 1996 elections, clearly demonstrates that the voters have strongly endorsed the candidature of those who contested on the Congress Party ticket. In the first 10 general elections to the Lok Sabha, held between 1952 and 1991, the Congress Party had won nearly 90 per cent of the seats. Even

on the four occasions when it did fare badly at the national level – 1967, 1977, 1989 and 1991 – the relative performance of the party in the state was appreciably better. In the 1967 Lok Sabha elections, though the Congress won only 54 per cent of the seats at the national level, its candidates were elected in 67 per cent of the seats in the state. In the 1977 Lok Sabha elections, the Congress had secured just 28 per cent of the seats at the national level, but won more than 90 per cent of the seats in the state. In 1989, the party secured merely 37 per cent of the seats at the national level but captured 96 per cent in the state. In 1991, the party won 44 per cent of the seats at the national level and 81 per cent in the state. Karnataka was verily a Congress bastion when it came to Lok Sabha elections.

Even when the electorate has given a clear mandate to a non-Congress Party to form the government in the state, it has continued to endorse the candidature of Congress candidates in the Lok Sabha elections. In the December 1984 Lok Sabha elections, the Congress won 24 of the 28 Lok Sabha seats. The Janata Party, which was then the ruling party in the state, was in a position to win merely four seats. However, in the assembly elections held just four months later, in March 1985, the same electorate gave a clear mandate to the Janata Party to form the government, electing its candidates in 139 of the 224 seats (over 60 per cent).

The composite state of Karnataka (earlier called Mysore) came into existence in 1956, subsequent to the reorganisation of states on linguistic lines. Four principal regions became part of the state: (a) Old Mysore (formerly a part of the princely state of Mysore); (b) Hyderabad-Karnatak (formerly a part of the territory of the Nizam of Hyderabad); (c) Bombay-Karnatak; and (d) the Madras Presidency and Coorg regions. Prior to independence and the reorganisation, the Old Mysore region has generally played a dominant role in Karnataka politics. This region accounts for half the Lok Sabha and assembly

constituencies in the state. A quarter of the Lok Sabha seats and those of the state assembly are in the Bombay-Karnatak region. The rest is distributed in the other two regions.

The caste factor has played a crucial role in electoral politics in the state. The lingayats and vokkaligas are considered the dominant castes and have been major players in state politics. The traditional stronghold of the lingayats has been the Bombay-Karnatak and Hyderabad-Karnatak regions, while the vokkaligas are a major force in the Old Mysore region. While the lingayats and vokkaligas account for 10.8 per cent and 15.3 per cent of the state population (together a little over 16 per cent), over the last four decades, a majority of the members of the state assembly and a significantly large number of Lok Sabha members have belonged to these two communities. The non-dominant backward castes emerged as a major political force when Devraj Urs became the chief minister in 1972. Urs was the first chief minister who belonged to the non-dominant backward castes. Urs attempted to unite the non-dominant backward castes and thus break the hegemony enjoyed by the dominant castes. Since the late 1970s, the non-dominant backward castes have had a powerful impact on electoral outcomes and their representation in the legislature and state council of ministers has grown [see Shastri 1994, 1995; Shastri and Latha (forthcoming)].

The Karnataka electorate has also not favoured regional parties, either in Lok Sabha or assembly elections. Electoral competition has largely been between the Congress on the one hand and Socialist Party/Swatantra Party on the other till the late 1960s. After the Congress split in 1969, the two factions of the Congress were the principal political forces. With the formation of the Janata Party in 1977, it became the principal opposition party at the state-level. The BJP emerged as a third force in Karnataka politics with the 1983 assembly elections. Ever since, it has attempted to consolidate its electoral base.

Though regional parties have occasionally been formed, they have had limited electoral success. Devraj Urs floated the Kranti Ranga in the early 1980s but the party later merged with the Janata Party. S Bangarappa, a former chief minister of Karnataka, broke away from the Congress to form the Karnataka Congress Party in 1993. In the 1994 assembly elections that party secured 10 seats in the 224-member house, way behind the Janata Dal, Congress and the BJP. It was principally responsible for damaging the prospects of the Congress candidates in several constituencies, thus enabling the Janata Dal and BJP candidates to emerge victorious [Shastri 1995:44]. The Karnataka Congress Party has since, merged with the Congress. Yet another regional party, the Karnataka Rajya Raitha Sangha (KRRS) formed to protect the interests of farmers has also performed dismally at the polls with just 3.6 per cent of votes, winning merely two seats in the 1989 assembly poll and one seat in the 1994 assembly elections (2.8 per cent of votes). The emergence of the Lok Shakti and its role and position in Karnataka politics is assessed at length, while analysing the 1998 Lok Sabha poll.

ELECTORAL POLITICS IN 1980s AND 1990s

An ideal backdrop for the analysis of Karnataka politics in the 1990s would be the outcome of the 1983 assembly elections and subsequent political developments. Till the 1983 assembly elections, the Congress had a near monopoly over power. As mentioned earlier, it had also captured a majority of the Lok Sabha seats from the state in successive elections till 1996. The 1983 assembly elections had resulted in no party securing a clear majority of seats. The Janata Party – which was the single largest party – formed a minority government under the leadership of Ramakrishna Hegde, with the outside support of both the Leftist parties and the BJP. The maturity of the Karnataka voters was strikingly demonstrated yet again in 1984-85, when they elected 24 Congress nominees (out of 28) to the Lok Sabha in December 1984 and within a few months – in March 1985 – expressed a desire that the Janata Party government continue in power in the state, by giving the party a clear majority in the assembly elections. However, the Janata Party was soon caught up in an internal power struggle. In August 1988, chief minister Ramakrishna Hegde resigned, accepting moral responsibility for the tapping of telephones of political leaders. S R Bommai was elected to succeed Hegde as chief minister but his

government appeared to stumble from crisis to crisis. Within less than eight months of assuming office, in April 1989, the Bommai government, faced a major crisis when dissident legislators wrote to the governor withdrawing support to it. The governor dismissed the Bommai government and the state came under president's rule.

The 1989 assembly elections, held after a spell of seven months of president's rule, saw the Congress Party winning 178 seats in a 224-member House, securing in the process, a three-fourths majority. Never before, had the Congress Party – or for that matter any other party – secured such a high percentage of seats in assembly elections in Karnataka. The party that had been elected to power in the previous election, the Janata Party, now in its new incarnation as the Janata Dal, just managed to retain its status as the principal opposition party by securing 24 seats, a steep fall from the 139 seats it had earlier won.

The voters had unequivocally endorsed the claims of the Congress Party and had nursed the fond hope that the infighting and instability witnessed during Janata Party rule would be a thing of the past. Such optimism on the part of the voters could be justified on the ground that the Congress Party had explicitly stated in its election manifesto that if voted to power, it would ensure stability and progress in the state. For, any party that has had to cool its heels in the opposition for seven long years, would be expected to take its elections promises seriously. The Congress Party had all factors going in its favour with the 1989 assembly election results – a fund of goodwill, a steam roller majority and an opposition that had been decimated and was in total disarray. However, gradually the party seemed to lose direction. The voters in the 1991 Lok Sabha elections sounded a warning, when only 23 of the 28 Congress nominees were elected. The party leadership did little to remedy the situation.

Having changed its legislature party leader and chief minister thrice in five years, the Congress was plagued by infighting and internal discord, which contributed to a lacklustre performance at the governmental level. One of the major problems that both Bangarappa and Moily faced as chief ministers was that they had to silently accept a situation, where their senior ministers time and again, expressed their lack of confidence in their leadership. It was very clearly, the familiar story of a public mandate not respected, a public mandate treated with insensitivity and the

gradual evaporation of public support – all self-inflicted.

It was against this backdrop that the 1994 assembly elections were held. The emergence of the Janata Dal as the majority party in these elections took many observers by surprise. The party, which had barely managed to win 24 seats in 1989 and did not win a single seat in the 1991 Lok Sabha elections, was hardly expected to stage such a dramatic comeback, in spite of the dismal performance of the Congress government. While many attributed the Janata Dal victory to the anti-Congress vote or the 'anti-incumbency syndrome', this cannot be the sole explanation. Even if it were to be assumed that the voters were unhappy with the Congress, they had an option of voting either for the Janata Dal or for the BJP. The fact that the Janata Dal secured a majority was indicative of the positive choice of the voters. Further, it must be noted that the Janata Dal victory had little to do with the national agenda of the party. In Karnataka, the state leaders of the party, had distanced themselves from the developments in the party at the national level. The electoral verdict was essentially dictated by local issues and developments. The emergence of the Janata Dal as, what many believed, a federal party was welcomed by large sections. It must be said to the credit of the Janata Dal that the groundwork for a spirited election campaign had been laid well before the announcement of elections by the leadership 'troika' of Ramakrishna Hegde, Bommai and Deve Gowda. Bommai rightly declared that the election verdict was a 'victory for collective leadership' (*The Times of India*, December 10, 1994).

1996 LOK SABHA POLL

The 1996 Lok Sabha elections were held within a year and a half of the return of the Janata Dal to power in the state. The three major political parties – the Janata Dal, Congress and BJP – had evolved elaborate electoral strategies, as success in these elections was critical for them, both regionally and nationally. For the Janata Dal, winning a sizeable number of

TABLE 1 LOK SABHA ELECTIONS 1996, KARNATAKA

Party	Votes Polled	Seats Won	Seats Won (Per Cent)
JD	34.9*	57.1	16
INC	30.3	17.9	5
BJP	24.9	21.4	6
KCP	3.1	3.6	1

The CPM an electoral ally of the Janata Dal polled an additional 0.4 per cent of votes.

seats in the state, was vital for the survival of its government. Earlier, in 1984, the then chief minister Ramakrishna Hegde had resigned on moral grounds after the Janata Party had won just four Lok Sabha seats in the state. For the Congress, a large contingent from Karnataka was vital, as it was one of its 'safe states'. For the BJP, Karnataka seemed to be the only launching pad in the entire South and a creditable performance in the state could bolster its chances of inching towards the half way mark in the Lok Sabha.

The Janata Dal faced a major crisis during the campaign, with some leaders emphasising that the election was a referendum on the performance of the state government while others wanting the party to exclusively focus on the failures of the central government. But for this controversy, the party's campaign was, by and large, well organised. It made a determined effort to expand its social base, under the collective leadership of Deve Gowda (a vokkaliga), Ramakrishna Hegde (a brahmin) and Bommai (a lingayat) and the conscious and clear projection of a second line of leadership consisting mainly of backward class, dalit and minority leaders. In view of the apparent resentment in northern Karnataka (where the lingayats wield tremendous influence) about the perceived domination of vokkaligas in the state's administration, the party campaign in this region was largely left to Hegde and Bommai. The reasonably good record of the state government – which had just completed 17 months in office, also helped the Janata Dal.

The Congress on the other hand, did not appear to have sufficiently recovered from the defeat it had suffered in the 1994 assembly elections. Little effort was made to co-ordinate the campaign and prominent leaders of the party, who had been denied nomination stayed away from the campaign and in some cases appeared to have indirectly helped the nominees of other parties.

The BJP appeared to have altered its strategy, with good governance ('Su-raaj') under the leadership of Vajpayee, being its main campaign slogan. Hindutva appeared to have been pushed to the background and was raised towards the end of the campaign as an afterthought. The party was handicapped by the fact that it had no effective charismatic leadership at the state level.

The Centre for the Study of Developing Societies (CSDS) post-poll survey in Karnataka clearly reveals that more than 72 per cent of the respondents were not

interested in the election campaign. Nearly 80 per cent had not attended any campaign meeting and more than 90 per cent were emphatic in stressing that they had themselves not participated in any campaign. However, it is significant that among the respondents who expressed a definite view on the subject, nearly 70 per cent felt that their votes mattered. Further, more than 40 per cent respondents asserted that they made up their mind as to whom to vote for on polling day and another 25 per cent stated that the decision regarding voting was made a few days before the poll.

The voter turnout in the state was just over 60 per cent. This was substantially higher than the voter turnout in the 1991 Lok Sabha poll, when only 55 per cent of the voters exercised their franchise [Shastri 1994:383]. The voter turnout in the Lok Sabha elections (1996) was significantly lower than in the 1994 assembly elections, when more than 68 per cent of the voters had cast their votes. In Karnataka, since the 1970s, the voter turnout in assembly elections has been considerably higher than in Lok Sabha elections [Shastri 1995:45].

ANALYSIS OF 1996 ELECTORAL VERDICT

Though the Janata Dal won more than 57 per cent of the seats, it secured only 35 per cent of the votes. Parties winning a majority of seats with only a minority of the votes – referred to by Rae, as a system of 'manufactured majorities' [Rae 1967:74] has become common under the first-past-the-post election system. The Congress on the other hand, secured a little over 30 per cent of the votes, but won just 18 per cent of the seats. There is not much variation in the percentage of votes polled and seats won in the case of the BJP and KCP. Even though the BJP secured one seat more than the Congress, its votes share was significantly lower. A similar trend was seen in the Karnataka assembly elections in 1994, when the BJP emerged as the largest opposition party (pushing the Congress to the third position) but polled less votes than the Congress [Shastri 1995:14, 20-22].

The votes polled by the Congress in the 1996 Lok Sabha poll, were the lowest ever polled by the party. In previous Lok Sabha elections its votes share never fell below 40 per cent in the state. Even in the assembly elections, it managed to secure more than 40 per cent of the votes, save in 1994 when it polled a mere 27 per cent. The Janata Dal, which polled nearly 35 per cent, recorded its best ever performance in terms of votes, in the last decade. Earlier, in the 1977 Lok Sabha elections,

it had secured 40 per cent of the votes and in the 1984 Lok Sabha poll its votes share was 35 per cent. The larger votes share for the party in these two elections – though it won only two seats in 1977 and four in 1984 – needs to be viewed in terms of the absence of a third force. The principal contest was between the Congress and the Janata Party. In the 1996 Lok Sabha poll there was a three-way split of votes between the Congress, Janata Dal and the BJP.

The BJP, which polled a little less than 25 per cent of the votes in 1996, had secured a higher percentage of votes in the 1991 Lok Sabha elections – nearly 29 per cent – though it secured only four seats then as compared to six seats in 1996. That the Congress secured fewer of seats and higher percentage of votes as compared to the BJP can be explained in terms of the nature of electoral contest in the 28 Lok Sabha constituencies. While the Janata Dal nominees emerged victorious in 16 constituencies, they secured the second position in as many as six constituencies. Thus the party registered its presence in 23 of the 28 constituencies. The BJP candidates were victorious in six constituencies and secured the second place in another six constituencies. The party was thus, in the first or second position in only 12 of the 28 constituencies. In the case of the Congress, though it secured only five seats, its candidates emerged second in as many as 15 constituencies. The party was thus in the first or second position in as many as 20 of the 28 constituencies. It is also worth noting that while only two Janata Dal and three Congress nominees forfeited their security deposits, as many as 8 BJP candidates lost their security deposits.⁴ It thus becomes clear that while the Congress was a principal contestant in more than 70 per cent of the constituencies, the BJP was in the first or second position in only 43 per cent of the constituencies. A similar trend was seen in the state assembly elections held in 1994.

An analysis of the swing of votes from the 1991 to the 1996 Lok Sabha elections reveals that there had been a 17 per cent swing in favour of the Janata Dal. There

TABLE 2: LOK SABHA ELECTIONS, 1996: PRINCIPAL CONTESTANTS

Principal Contestants First and Second Position	No of Constituencies
Janata Dal-Congress	12
Janata Dal-BJP	4
Congress-Janata Dal	4

BJP-Congress	3
BJP-Janata Dal	3
KCP-BJP	1

had also been an 11 per cent swing against the Congress and a near 4 percentage point swing against the BJP.

A constituencywise analysis shows that, in the case of the Janata Dal there has been a swing in favour of the party in as many as 26 of the 28 constituencies. In 16 of these constituencies, the swing was as high as 10 percentage points. Of the two constituencies in which there has been a fall in the percentage of votes, in one (Bidar) an ally of the Janata Dal – the CPM, had fielded a candidate. In the case of the Congress, there was a swing against the party in all but one constituency. In 15 of these constituencies, the swing against the party was more than 10 percentage points. The BJP had a mixed fortune in this regard, as in 10 constituencies there was a swing in favour of the party and in the other 18 there was a swing against it. In nine of the constituencies the swing against the party was as high as 10 per cent. Interestingly, in all the 4 constituencies where the party had emerged victorious in 1991, there was a swing of votes against the official party nominees. The standard deviation calculated, for the swing of votes of all parties shows that in the case of the BJP the standard deviation was significantly higher (10.88), implying that the variation in swings was much greater in its case.

If the votes polled by the political parties in the 224 constituencies, in the 1994 assembly elections, are viewed from the angle of the 28 parliamentary constituencies clubbing together the votes polled in the eight assembly constituencies which form a single parliamentary constituency, the Janata Dal candidates secured the highest votes in 21 of these constituencies, the Congress in four and the BJP in three.⁵ In the Lok Sabha elections, both the Congress and the BJP were in a position to win two seats each, from among the seats in which they had secured a majority in the 1994 assembly elections. The Janata Dal won only 15 of the 21 seats in which it had secured the highest votes in the 1994 assembly elections.

An analysis of the partywise swing of votes from the 1994 assembly polls to the 1996 Lok Sabha elections reveals interesting trends. In the case of all three major parties – Janata Dal, Congress and BJP – there has been a swing of votes in favour of the parties in a majority of the constituencies. In the case of the Janata Dal, there was a swing in favour of the party in as many as 19 of the 28 constituencies. For the Congress there was a swing in favour of the party in 20 of the 28 constituencies and for the BJP there was a swing in favour

of the party in all but four of the constituencies. This implies that the performance of the BJP and the Congress in the Lok Sabha elections, has shown a significant improvement as compared to the assembly elections of 1994.

The fact that there has been a swing of votes in favour of all the three major parties in the Lok Sabha elections as compared to the assembly elections also implies that there has been a greater consolidation of votes in favour of the three major parties in the Lok Sabha elections. Between them, these three parties account for more than 90 per cent of the valid votes polled in the Lok Sabha elections. On the other hand, in the 1994 assembly elections, they accounted for only 78 per cent of the valid votes polled,⁶ with independents and other minor parties securing 22 per cent of the votes.

A three-way split in votes in most constituencies in the 1996 elections is evident from the fact that in 19 of the 28 constituencies (68 per cent), the votes polled by the winner and the immediate loser total up to less than 75 per cent of the valid votes polled. Further, in only one constituency (Chikkodi) did the winning candidate secure a majority of the valid votes polled.

The margin of victories, as seen in terms of the percentage of votes polled [Shastri 1996:157], shows that the victory margins of the successful Congress candidates were in the less than three per cent range, which implies that all the five Congress MPs from the state, won by slender margins. In the case of the Janata Dal, six of the 16 victories were by margins of less than three per cent of the valid votes polled. These victories were decisive in ensuring that the Janata Dal won a majority of the seats in the state. In five other constituencies, the margin of victory of the Janata Dal candidates was more than 10 per cent of the valid votes polled. In the case of the BJP, some of its candidates won by slender margins while others won decisively.

A comparative assessment of the performance of various parties in the four regions of the state reveals interesting trends. The Janata Dal did exceedingly well in the Old Mysore and Hyderabad-Karnatak regions but failed to register its presence in coastal Karnataka. While the Congress drew a blank in the Hyderabad-Karnatak region, it secured its seats in the Bombay-Karnatak, Old Mysore and coastal Karnataka regions. The BJP registered victories in all the regions, but its performance was exceptionally poor in the Old Mysore region, where the percentage

of seats it secured was much lower than its overall state average.

A majority of the candidates fielded by the Janata Dal and the BJP hailed from the dominant castes – the lingayats and vokkaligas. While the Janata Dal fielded eight lingayats and seven vokkaligas, there were 11 lingayats and five vokkaligas from among the BJP candidates. The Congress fielded four lingayats and seven vokkaligas. OBCs accounted for eight of the Congress candidates, seven of the Janata Dal and four of the BJP. The Congress and the JD had fielded five dalit candidates each, while the BJP fielded four dalits. The Congress nominated two Muslims and the Janata Dal, one. Of the 28 candidates who emerged victorious,

10 belonged to the dominant castes – five lingayats and 5 vokkaligas. Among the other victors were four dalits, six from the OBCs, two Brahmins, two Muslims and one each from Idiga, Kuruba, Jain and Christian.

Though the dominant castes account for only 36 per cent of the victors, in the Janata Dal they account for half the victors, three lingayats and five vokkaligas. It is significant that all the five vokkaliga candidates who emerged victorious hailed from the Janata Dal. Both the brahmins and the remaining dominant caste victors were elected on the BJP ticket. All the Congress victors belong to non-dominant, non-forward castes. The skewed representation from the dominant castes has also been noticed in the elections to the state assembly held in 1994.

1998 LOK SABHA POLL.

It would be relevant to recall at this stage, the major political developments in Karnataka subsequent to the 1996 Lok Sabha elections as they appear to have had a major impact on the nature of electoral preferences expressed in 1998. The Janata Dal's creditable performance in 1996 came as a surprise to many political observers (including Janata Dal leaders themselves) and was a crucial factor in the choice of Deve Gowda as the leader of the United Front and his subsequently becoming prime minister. However, the suspension of Ramakrishna Hegde from the Janata Dal, within days of the Deve Gowda government winning the confidence vote in the Lok Sabha, shattered the unity which had been so tenuously maintained by the party leadership in the state ever since 1993. The promise of unity held out by the leadership trioka (Hegde, Bommai and Deve Gowda) had played a significant role in ensuring the party's victory both in the 1994 assembly and the 1996 Lok Sabha elections.

Further, the performance of the Janata Dal government in the state under the leadership of J H Patel left much to be desired and did not appear to inspire confidence among the Janata Dal workers. It has been argued that the manner in which the state government functioned and the forces that appeared to call the shots were clearly indicative of the influence and power wielded by the dominant castes. Even among these castes, many lingayats – especially in northern Karnataka – were convinced that the vokkaligas alone were manipulating and managing power. This development resulted in the gradual alienation of the other backward communities (OBCs), minori-

ties and dalits. The polarisation on caste lines within the ruling Janata Dal came to the fore when Laloo Prasad Yadav rebelled against the national leadership of the party (which included Deve Gowda), with the OBC leaders in the party at the state level, using the occasion to express their displeasure at the manner in which the vokkaligas appeared to control and manipulate the government machinery at the state level. Several OBC leaders in the state Janata Dal, who in the past had been staunch supporters of Deve Gowda, now openly expressed their dissent at the manner in which Deve Gowda's confidants were attempting to use the state machinery for furthering their own caste/personal interests. The above factors had a crucial impact on the 1998 poll. The clear erosion of the support for the Janata Dal was evident in the results of the bye-elections to the state assembly held between 1996 and 1998.

The formation of the Nava Nirmana Vedithe and later the Lok Shakti by Ramakrishna Hegde triggered off further realignment of political forces. While on the one hand it permitted the supporters of Hegde to unite under his leadership, it also provided an alternative to those in the Janata Dal who were unhappy with or against those controlling the party in the state.

After the 1996 Lok Sabha poll, the Congress did attempt to rethink its strategy in view of its dismal performance in the state. As mentioned earlier, though the party was relegated to the third position

in the 1996 poll, in terms of votes it came second, way ahead of the BJP. The party made serious attempts to widen its support base among the OBCs and minorities, especially in view of the Janata Dal being perceived as a party that served the interests of the dominant castes. Leaders from among the OBC and dalit communities were accorded prominent positions in the party, including the presidency of the KPCC and leadership of the Congress Legislature Party (CLP). With Sitaram Kesri taking over as the Congress president, the return of Bangarappa and his supporters was successfully negotiated (later when Bangarappa once again left the party many of those who had earlier aligned with him preferred to remain in the Congress). However, the party was unable to launch a serious and sustained campaign against the lacklustre performance of the Janata Dal government in the state. The party also found it difficult to effectively and convincingly explain its outside support to the United Front government at the centre. Above all, the party was plagued by serious infighting and absence of an effective state level leadership.

Soon after the 1996 poll, the BJP attempted to consolidate on its performance in the elections. The party realised that though it may have emerged second in the state, in terms of votes share, it was five percentage points behind the Congress. When the 13-day Vajpayee government was forced to resign, having failed to muster the necessary support in the Lok

* Based on the figures in the Chinnappa Reddy Report.

Sabha, the BJP launched a widespread campaign to generate a 'sympathy wave'. The post-poll survey conducted by the CSDS soon after the installation of the Deve Gowda government in 1996, showed that a little over 12 per cent of the respondents favoured Vajpayee as prime minister. In the pre-poll survey held at the time of the announcement of the elections, only a little over 4 per cent of the respondents favoured him as the prime minister, implying an 8 percentage point increase in support. The party found itself in an advantageous position as it could highlight both the failures of the United Front government at the centre as well as the poor performance of the Janata Dal state government. The party made serious efforts to win the support of sections of the powerful lingayat community in northern Karnataka. It is in this context that alliance with the Lok Shakti is significant. The BJP-Lok Shakti alliance was mutually complementary and the calculation of the BJP was that by aligning with the Lok Shakti, it would be possible for the party to widen its support base. The strategy paid rich dividends. The importance that the Karnataka voters attached to the 1998 poll can be seen from the fact that in all the constituencies in the state, there was an increase in the percentage of voter turnout.

ANALYSIS OF 1998 ELECTORAL VERDICT

Electoral and political analysts have emphasised the importance of the anti-incumbency factor in recent elections in India. However, in Karnataka the impact of the 'anti-incumbency syndrome' is distinct in two significant ways. In most other states, the principal Opposition party was the beneficiary of the anti-incumbency mood. In Karnataka, even if it were to be conceded that the incumbency factor worked against the Janata Dal, it must be emphasised that the voters were presented with two alternatives to the Janata Dal, the BJP/Lok Shakti alliance and the Congress. Terming the Karnataka verdict as an anti-incumbency vote would only be partially true, as the results also reflected a positive preference expressed in favour of the BJP/Lok Shakti alliance.

The relegation of the Janata Dal to the third position in Karnataka, is likely to have a long-term impact on the party's role in state politics. The votes share of the party has fallen by nearly 13 percentage points. In 25 of the 28 constituencies there was a swing of votes against the party and in most cases the decline was by more than 10 percentage points. The party nominees were in the first or second

position in only six of the 28 constituencies, implying that the party was a principal contestant in less than one-fourth of the seats. Ten of its candidates lost their security deposits; of these two were sitting MPs and one a state minister. Nine of the 10 sitting MPs of the party who sought re-election on the party ticket were defeated. All the four state ministers who contested the elections, were defeated.

Even though the Congress has improved on its previous performance with its votes share having registered an increase of over 5 per cent, it was unable to repeat its pre-1996 performance of winning a majority of seats in the state. Its nominees finished first or second in all constituencies save one, indicating that it was a principal contestant in 27 of the 28 constituencies. None of its candidates forfeited their deposits. As mentioned earlier, infighting in the party appears to have been largely responsible for the defeat of the party candidates in several constituencies. Further, the party preferred to re-nominate many of those who were defeated in 1996. Six of those defeated in 1996 and re-nominated in 1998, had to once again taste defeat, some losing by wide margins.

The BJP/Lok Shakti alliance appears to have benefited the BJP more than the Lok Shakti. Of the 13 seats the BJP won (of the 18 it contested), five were seats it retained from the previous elections and another five seats were those where it had come second in 1996 – having lost by narrow margins. Only three seats were those where it had come third in the previous elections. All these three seats are in the Old Mysore region, where the influence of the Lok Shakti was largely limited. The BJP was a principal contestant – its nominees came first or second – in 15 of the 18 constituencies in which it fielded candidates. Only one of its candidates lost his deposit.

Attention also needs to be focused on the Lok Shakti's performance. The party was able to win three of the 10 seats it contested. Its candidates came second in five constituencies, making it a principal contestant in eight of the 10 constituencies. Its capacity to ensure the switch of Janata Dal votes to the Lok Shakti/BJP alliance remains untested as in six of the seven constituencies where its candidates lost, the seats were earlier held by the Janata Dal and were wrested by the Congress.

When the electoral performance of the various parties is seen regionwise, it is noticed that the BJP did exceptionally well in the coastal Karnataka (where it won

all the three seats) and in Bombay-Karnatak (where in alliance with the Lok Shakti it won all but one of the seats). In Old Mysore, the BJP was in a position to win six of the 14 seats it contested. All the Lok Shakti victories were in the Bombay-Karnatak region and the party drew a blank in the Old Mysore and Hyderabad-Karnatak regions. Its poor performance in the Hyderabad-Karnatak region needs to be taken note of as it had fielded candidates in three of the five constituencies in this region claiming them to be its strongholds. All the three Janata Dal victories were in the Old Mysore region. While five of the Congress victories were in the Old Mysore region, the party won three seats in the Hyderabad-Karnatak region and one seat in the Bombay-Karnatak region.

If we examine the social background of the elected MPs, we find that a significant number (15 of the 28) hail from the dominant castes – 10 lingayats and five vokkaligas. In the Bombay-Karnatak region, save for one reserved seat, in all the other constituencies, lingayats have been elected. A significant number of the BJP/

Lok Shakti candidates in the Bombay-Karnatak and Hyderabad Karnatak regions hailed from the lingayat community and as the alliance did well in these regions, six of the 13 BJP MPs and two of the three Lok Shakti MPs were from this community. The number of MPs from the non-dominant backward castes has registered a sharp decrease. Only five of the Lok Sabha MPs from Karnataka belong to the OBCs and of them four were elected on the Congress ticket

ANALYSIS OF SURVEY DATA

An analysis of the data from the survey conducted by the CSDS in 1996 and 1998 indicates interesting trends with regard to Karnataka. As it was a panel study, it is possible to assess changes in voter preferences and attitudes across two elections. The survey data reveals that the support for the Congress was spread over all age-groups and remained largely unchanged from 1996 to 1998. In the case of the BJP, it has significantly higher support among the younger generation (below 35 age group) in 1996, while its support was more evenly spread out across various age groups in 1998. However, if the support that the Lok Shakti (the ally of the BJP) is taken into account, the alliance appears to have greater support among the younger generation. In 1996, the Janata Dal support was more pronounced among those above 35 years of age. In 1998, the decline in support is also more pronounced in this category. In 1996, the Congress enjoyed greater support among women as compared to men, while in the case of both the Janata Dal and the BJP, their support was more pronounced among men as compared to women. However, in 1998 no significant difference is noticed in this regard.

A decisive swing of the Muslim vote in favour of the Janata Dal was apparent from the 1996 poll survey results, as was the continued suspicion about the BJP among this community. This remained largely unchanged in 1998, with the slight decline in the support that the Janata Dal received being transferred largely to the Congress. Significantly, the Lok Shakti had little support among the minorities and was also not in a position to secure for its alliance partner any increase in the minority votes. While the backward communities voted in significant numbers for the Janata Dal in 1996, their support seems to have gone the BJP/Lok Shakti way in 1998. The support for the Congress was evenly spread between urban and rural areas in 1996 but declined sharply in urban areas in 1998. The BJP appeared more popular in urban

areas and the Janata Dal in rural areas. The Lok Shakti's popularity too, was more significant in urban areas.

The 1996 post-poll survey also clearly showed that a majority, a little over 50 per cent, of the respondents felt that there has been no major change in the relations among social groups during the five-year period from 1991 to 1996. While 35 per cent felt that there was greater harmony among social groups during this period 12 per cent were of the view that tensions

among social groups had increased. The response of the voters to the tension resolving agencies is revealing. Over one-third of the respondents (36 per cent) felt that the caste/caste-leaders were the tension-resolving agency. While 22 per cent opined that the police played a major role in resolving social tensions another 16 per cent pointed out that panchayats help resolve social tensions. Only 8 per cent felt that the judiciary was the tension-resolving agency.

* 1996 figures in brackets.

While more than 70 per cent of the respondents felt that there was greater harmony among the various caste groups today, it is significant to note that just about 58 per cent of the respondents felt that there was defusing of tension between religious groups. A little over 54 per cent felt that tensions between dalits and non-dalits had reduced. While one of every four respondents felt that there was greater friction between the rich and the poor, an equal number were undecided on the question and half the respondents felt rich-poor harmony had actually increased. It is also significant that while over 60 per cent of the respondents felt that members of a particular caste voted for different parties, only 48 per cent felt that it was not important to vote along caste/community lines. A little over 30 per cent felt that it was important to vote on caste/community lines while 22 per cent were undecided in this regard.

In the light of the formation of a 13-party coalition government at the centre, headed by a former chief minister of Karnataka, in June 1996, the reaction of the respondents in Karnataka, about the feasibility and suitability of coalition governments merits scrutiny. In the pre-poll survey, while 19 per cent of the respondents saw nothing wrong in the formation of a coalition government, 21 per cent were willing to accept a coalition government in exceptional circumstances. More than one-third of the respondents (34 per cent) were not favourably inclined to the formation of such a government under any circumstances. Another significant 26 per cent had no opinion on the subject. The post-poll survey was conducted in Karnataka, after Deve Gowda had become prime minister. Only 28 per cent of the respondents favoured a coalition government and 23 per cent were for fresh elections. The number of respondents who had no opinion on the subject had risen to 48 per cent. It is interesting to note that the support for a coalition government had dropped especially after its formation at the centre. During the pre-poll survey the percentage of respondents willing to experiment with coalitions was higher as compared to those in the post-poll period.

A reaction in the post-poll survey, linked to the lukewarm response to coalition governments, is that nearly 22 per cent felt that the Congress should have formed the government after the poll and another 14 per cent supported the BJP's claim. Only 13 per cent justified the United Front's assuming office at the centre. Once again, nearly 40 per cent of the respondents were undecided. The respondents' response to

the question who was their choice for prime ministership reveals interesting trends. During the pre-poll survey, Narasimha Rao was favoured by nearly 15 per cent of the respondents and Vajpayee was supported by a little over 4 per cent. Hegde was considered most suitable by 5 per cent of the respondents. In the post-poll survey, held after Deve Gowda had become prime minister, the support for Narasimha Rao dropped to just below 13 per cent and rose in the case of Vajpayee to over 12 per cent. Nearly 19 per cent of the respondents favoured Deve Gowda as prime minister. The first prime minister from Karnataka had significant support in his home state though the support for Vajpayee also registered a substantial increase.

EMERGING POLITICAL TRENDS

In the past, whenever the ruling party in the state fared badly in the Lok Sabha elections, political compulsions either necessitated the dissolution of the assembly and the holding of fresh elections (1971, 1984) or resulted in mass defections to the party that emerged victorious in the Lok Sabha poll and the formation of an alternative government (1980). This time around it was anticipated that in the event of the Janata Dal facing a rout in the poll either the ruling party MLAs would join the Lok Shakti in large numbers, resulting in the formation of an alternative government or the assembly would be dissolved causing fresh elections. However, no such developments took place. With Lok Shakti leader Ramakrishna Hegde joining the Vajpayee cabinet, the Janata Dal MLAs were reluctant to join the Lok Shakti, in view of their reservations about who would lead the alternative Lok Shakti/BJP government. Further, the BJP was not too enthusiastic about the formation of a Lok Shakti/BJP government with the help of Janata Dal MLAs crossing over to the Lok Shakti as such a government would have the Lok Shakti in the drivers seat with the BJP having to play second fiddle. Both the BJP and the Lok Shakti did not appear keen on fresh elections, as such a development had the potential to adversely affect their alliance. In the event of an assembly poll, the BJP/Lok Shakti alliance would come under severe strain on the question of which party should be the senior partner. In the light of the slim majority of the BJP-led government, neither the BJP nor the Lok Shakti were keen to take any step that would adversely affect the stability of the central government. The Congress too, did not seem to favour immediate elections.

The party was unhappy with its performance in the Lok Sabha poll and wished to further stabilise its position in the state. Besides cashing in on the non-performance of the Janata Dal government in the state, the Congress hoped that the problems that the BJP-led coalition government at the centre was likely to face, would result in the erosion of its support and return of the voters to the Congress. It thus suited all the major players in Karnataka to maintain the status quo and permit the assembly to complete its full term.

Over the last 18 months, since the 1998 Lok Sabha elections, significant political developments have been witnessed in Karnataka. Sitting in the opposition (both at the centre and in the state), the Congress saw itself as the 'natural choice' of the electorate in the next assembly poll. In order to attract the support of the dominant vokkaliga community, an influential leader from this community was appointed as state Congress president. Leaders from the other dominant castes – the lingayats and those from backward communities were appointed to other important positions, in order to balance the social equations. However infighting continued to plague the party. Two developments need to be noted in this context. The Congress admitted to its fold several Janata Dal leaders and those who had joined Ramakrishna Hegde's non-political outfit the Nava Nirmana Vedike. This has caused intense heartburn among the Congress 'loyalists'. Secondly, party leaders from the influential lingayat community, have felt sidelined and one of them (who was in the race for state Congress presidentship) has left the party to join the BJP.

The Lok Shakti has done little to consolidate its base in the state. With Hegde joining the government at the centre, his interests in state politics appears to have waned, resulting in the state leadership of the Lok Shakti being left to deal with developments in the state. Further, Hegde made little effort to iron out the differences between those in the Lok Shakti and the Nava Nirmana Vedike (the Vedike was a non-political platform created by Hegde when he was expelled from the Janata Dal and continued even after the Lok Shakti was formed in order to accommodate those Janata Dal MLAs who had aligned with Hegde but did not wish to suffer disqualification under the Anti-Defection Law). This resulted in many Vedike leaders joining the Congress.

The ruling Janata Dal continued with its lacklustre performance. Differences between Deve Gowda and chief minister J H Patel surfaced from time to time. The

increased interference of Deve Gowda's supporters (including his two sons, one of whom was a minister in the state government) in the state administration further increased the tensions between Patel and Deve Gowda.

The BJP has attempted to further consolidate on its electoral success in the 1998 polls. Having led in 95 of the 224 assembly segments in the 1998 Lok Sabha poll, the party hoped that with the support of the Lok Shakti (which led in 25 assembly segments – making a total of 120 of the 224 assembly segments) it would be in a position to form the government.

The split in the ruling Janata Dal on the eve of the Lok Sabha and assembly polls is a development of immense political importance and may significantly effect the electoral prospects of the major political players. The realignment of political forces was a natural corollary to the internal developments in the Janata Dal in recent years. It is the culmination of a process, which began, with the suspension of Ramakrishna Hegde from the Janata Dal, soon after Deve Gowda became prime minister. It needs to be borne in mind that in 1996, Hegde had a major role to play in the choice of J H Patel as the leader of the Janata Dal Legislature Party in Karnataka. Deve Gowda had favoured Siddaramaiah for this position. Patel has for many years been regarded as a Hegde loyalist. The blatant interference in the administration by Deve Gowda's supporters during Patel's reign and the chief minister's inability to arrest the trend and the anointing of Siddaramaiah as the chief minister-in-waiting, should the Janata Dal win the assembly elections, were all indicative of the increased tensions between Patel and Deve Gowda. Further, many of those who have aligned with the Patel faction of the Janata Dal were erstwhile staunch supporters of Deve Gowda who developed serious differences with him in recent years. With the Patel faction of the Janata Dal aligning with the Lok Shakti and supporting the National Democratic Alliance (NDA), the bargaining power of the latter has increased tremendously. It appears as if the BJP, in spite of its opposition to the entry of the Janata Dal faction into the NDA, would have to reconcile itself to conceding more seats than it would have earlier, to the Lok Shakti/Janata Dal (Patel) combine in Karnataka. Even though the BJP won in 95 of the 224 assembly segments in the 1998 Lok Sabha elections, to be able to defeat the Congress an alliance with the Lok Shakti/Janata Dal (Patel) is crucial. Even in the 1998 Lok Sabha elections, the Congress was a

principal contestant (in the first or second position) in 27 of the 28 constituencies, while the BJP/Lok Shakti alliance was a principal contestant in 25 of the 28 constituencies. Earlier, in the 1994 assembly elections, the BJP, was a principal contestant in only 64 of the 224 constituencies whereas the Congress was a principal contestant in as many as 158 of the 224 constituencies [Shastri 1995:20-24]. The Congress has been shocked out of its complacency after the recent split in the Janata Dal. An alliance between the BJP-Lok Shakti-Janata Dal (Patel), would result in a near one-to-one contest, between the alliance and the Congress with the third force (Janata Dal – Deve Gowda faction) being relegated to the background. From tri-polar electoral contests, Karnataka seems to be heading towards a bi-polar alliance system.

Notes

- 1 The term Congress Party is used to refer to the Indian National Congress prior to 1969, the Indian National Congress from 1969 to 1971, Indian National Congress from 1971 to 1978 and the Indian National Congress(I) after 1978
- 2 While using the term Janata Dal, the reference is to the Janata Party from 1977 to 1989.
- 3 Though H D Deve Gowda was elected to the Lok Sabha in 1991 from Hassan (Karnataka), he had contested on the Samajwadi Party ticket.
- 4 Section 158 of the Representation of Peoples Act 1951, states that a candidate who secures less than 1/6 of the votes polled, forfeits the security deposit.
- 5 While calculating the votes polled by parties in the 1994 assembly elections, the eight assembly constituencies which form part of one parliamentary constituency are taken together
- 6 The margin of victory has been calculated in terms of the percentage of valid votes polled,

in view of the fact that the electorate, voter turn out and number of valid votes varies considerably from constituency to constituency.

We are a group of historians, sociologists and anthropologists working on the sociology of religion and religious communities in India. In order to explore what we see as some of the inadequacies of the sociological framework in dealing with religious communities, we are planning a workshop in March 2000. Our main concerns centre around the issues of developing a historicized approach to the study of religion, to expanding the sociology of the relation between text and practice and understanding the interaction between the different religious streams. These as well as specific issues relating to the study of religious groups such as the question of the text, conversion, 'syncretism', and social organization will be some of the themes of the workshop.

Political Realignments in Post-NTR Andhra Pradesh

K Srinivasulu
Prakash Sarangi

The volatility of the electoral performances of Telugu Desam Party and Congress in the post-N T Rama Rao Andhra Pradesh could be symptomatic of deeper changes in their social bases. The voters have accepted Chandrababu Naidu as NTR's successor, and have continued to accept him as such even after he moved away from some of NTR's policies. But the OBC, ST and Muslim supporters of TDP have shown some unease recently. Both the TDP and the Congress experienced seat changes and swings in their vote margins in 1998 elections with the BJP deriving some benefit from this.

THE political scenario in the post-N T Rama Rao phase of AP politics has been characterised by both continuity and change. While the continuity is transparent in the dominant presence of the Telugu Desam Party (Naidu) (TDPN) and Congress(I) in the state politics, the change is something that defies precise characterisation. Electoral terrain is not merely a field of contest among political parties for power but significantly also a site of participation and articulation by popular classes of their interests and aspirations (and their co-optation by competing parties).

The orchestrated view is that the 1996 and 1998 Lok Sabha elections, keenly contested by the rival Telugu Desam groups – TDPN and TDP Lakshmi Parvati (TDPLP) – for the political legacy of N T Rama Rao (NTR), and between them and the Congress(I), have settled the social forces between the TDPN and the Congress(I) as two major players in the political arena. This view could be a very limited reading of the significance of these elections. The seat changes and increased vote margins witnessed in these elections between the TDPN and the Congress(I) on the one hand and between them and the BJP on the other have been attributed in the popular press to the local specificities. What is lost sight of in this crass empiricism is the possibility that the volatility evident in the electoral performance of dominant parties in the post-NTR period could be symptomatic of deeper changes in their social bases. Here an attempt is made, by locating these two elections in a historical perspective, at reading the electoral fluidity as indicative of a realignment of social forces carving out political space for an alternative articulation, the precise form and character of which is yet to crystallise.

The state of Andhra Pradesh was formed in November 1956, by merging Telangana – a region of nine Telugu-speaking districts

of the erstwhile Hyderabad state with the 11 districts of the Andhra state. The Hyderabad state which was under the rule of the Nizam became a part of the Indian union as a result of the police action in September 1948. The people of Hyderabad, under the leadership of the Communist Party of India (CPI), had waged a prolonged struggle against the Nizam's oppressive rule. The Congress Party had also been in the forefront of the people's struggle in this area. The Andhra state on the other hand, was formed in October 1953 by separating the Telugu-speaking districts of the Madras presidency, consequent upon an agitation by the Telugu-speaking people for a separate state of their own. The Andhra state itself consisted of two regions: the rich and fertile coastal Andhra districts and the poor and backward districts of Rayalaseema region. Thus the present Andhra Pradesh comprises of three geographical regions of Telangana, coastal Andhra and Rayalaseema,¹ each with its distinct regional profile. Each region's history, socio-economic development and political culture are invariably reflected in the electoral processes and outcomes.

Caste has been the basis of political grouping and mobilisation of electoral support in the state right from the beginning. Reddys and kammas, who constitute only 6.5 and 4.8 per cent of the state's population respectively, are the two politically dominant communities. The most important source of their power has been their control over land [Elliot 1970]. As the major landholders and occupants of important positions in the villages, they have traditionally controlled village political life. In the course of time they have expanded their activities into other spheres of the economy, i.e., business, transport, contracts and industry [Upadhyaya 1988; 1997]. The reddys are distributed in all the three regions of the state, but their

dominance is noticeable especially in the Telangana and Rayalaseema regions. The kammas, on the other hand, are dominant primarily in the coastal districts and their influence in other regions is negligible.

The brahmins are numerically very small, comprising as they do, a mere 3 per cent. They were politically active during nationalist movement. They are not an economically powerful group, and hence, their influence has declined during the last few decades. Among the other forward class peasant castes, the kapus, velamas and rajus are important castes that matter to a significant extent in state politics though they are confined only to smaller pockets in terms of their numerical presence and influence. The other backward castes (OBCs) comprising 46.1 per cent constitute a very large proportion of the state's population [Reddy 1989]. There has been process of gradual realisation of their numerical strength and collective interests in political and economic spheres, among these castes which became increasingly visible in the post-emergency period. This is a consequence of the process of economic development, state policies and expansion of educational opportunities and the politics of patronage pursued by the Congress under Indira Gandhi. Thus they are in a position today to challenge the traditional landowning castes in the rural areas. The scheduled castes (SCs), constituting 15.5 per cent of the population, are gradually emerging as a politically salient group. The two most numerous castes among them, the malas and madigas, comprising the bulk of agricultural labour are present all over the state. Andhra Pradesh has 6 per cent tribal population which is largely concentrated in the forest areas of the Andhra and Telangana regions. Similarly, the Muslims who constitute about 8 per cent of the state's population have their distinctive

impact on the politics of the Telangana and Rayalaseema regions.

I Era of Congress Dominance

The dominance of the Congress Party in the political history of Andhra Pradesh continued uninterrupted for three decades till it was upset by the TDP in the 1983 assembly elections. In the early years of independence, this region had witnessed a credible anti-Congress ideological articulation and popular vote. The left, comprising of the communists and different shades of socialists, was the mainstay of this opposition both in the Telangana region of Hyderabad state and Andhra state. Their failure to evolve into an alternative strong enough to displace the Congress is an instance of a lost possibility. After the formation of Andhra Pradesh state, the left has registered a gradual decline both organisationally and ideologically. Organisationally, it had been weakened and ideologically it got diffused as a result of successive splits following serious disputes on crucial politico-ideological questions.

In contrast to the left, the Congress during this period, displayed tremendous dynamism and political tact in tackling the challenges facing it. By conceding the demand for the 'Vishalandhra' state, organised on a linguistic basis, the Congress virtually hijacked an important issue of the left agenda. Further, through different agrarian reform measures, like the zamindari and jagirdari abolition, tenancy and land reform legislations, the Congress regime sought to address the crucial agrarian and land questions brought to the centre of Indian politics by the agrarian struggles of the 1940s. The overall changes, induced by the earlier agrarian radicalism and subsequent state reform have substantially altered the agrarian structure thus leading to the decline of the support base of the left. Added to these factors, there was ideological confusion and uncertainty in the communist camp as a result of Soviet Union's support for the Congress Party's formal commitment to create a 'socialist pattern of society'. In part, this confusion and uncertainty was both a cause and an effect of the split in the party between the CPI and CPI(M). In the meanwhile, the Congress Party was consolidating its position by accommodating in its fold, splinter groups which had earlier defected from the party, especially the Krishikar Lok Party of N G Ranga and Kisan Mazdoor Party of T Prakasam. It was also trying very hard to win over sizeable support from the Muslim community which was disenchanted after the police

action and the merger of Hyderabad in the Indian union.

The Congress Party maintained its absolute supremacy for almost two and a half decades, starting from the state's first election in 1957 (Tables 1 and 2). In the five elections to the legislative assembly during this period, it won between 57.5 percent and 76.3 percent seats and between 39.3 per cent and 52.3 per cent votes. In the six Lok Sabha elections during this period, its share of seats in the state varied from 68.3 per cent to 97.6 per cent and its vote share varied from 46.8 per cent to 57.4 percent. It is interesting to note that the Congress Party did not lose its dominance in any of the elections, not even in the 1967 election when it lost power in as many as eight states nor in the 1977 election, when it was completely routed in almost every corner of the country. On the contrary, it sent a record number of 41 members to the Lok Sabha in 1977. Thus, the Congress Party's performance during this period was significantly better than that of any other political party. Apart from the communist parties, the other parties which contested elections at different phases but had only a marginal influence on the state's politics were the Swatantra Party, the Jan Sangh, Socialist Party, Praja Socialist Party, Republican Party of India, Majlis-e-Ittehadul-Muslimeen, Congress (O) and Janata Party.

The Congress Party's sterling electoral performance during this period however, conceals a major weakness, its internal factionalism. It was the clash of personalities among Congress leaders which was reflected in several powerful agitations in the state: for a steel plant during the mid-1960s, for a separate Telangana in the late 1960s and the Jai Andhra movement in the early 1970s. These agitations also partly symbolised a struggle for power among different strata of society. Several of Indira Gandhi's initiatives in introducing socio-economic programmes aimed at addressing the interests of, and rallying the sup-

port of marginalised groups like backward castes, dalits, tribals and women.

Indira Gandhi's populist radicalism and political strategy of mobilisation and accommodation of marginalised groups was instrumental in increasing the social polarisation along both caste and class lines. This not only led to the breakdown of the traditional patron-client relationships at the local level but also paved the way for the decline of the political control of dominant landed castes. Indira Gandhi's populism and radical rhetoric, by raising the aspirations and expectations of the marginalised social groups and communities, opened up a new phase of political contradictions. Thus caught up in the contradictions and intense factionalism – a reflection of the contradictions – the Congress under Indira Gandhi increasingly resorted to centralisation of power: at the political organisational level in the high command of the party and at the governmental level in the centre. The consequence of this process was the erosion of regional leadership and initiative. The failure of the Congress Party to accommodate contending interests, its inability to channelise the politicisation of marginalised communities opened up new political possibilities. It is against this background that the emergence of the TDP in AP has to be appreciated.

II Emergence of Telugu Desam Party

The 1980s brought about an important change in the political history of the state. The Congress Party tasted defeat for the first time in the electoral history of the state. It was a sequel to the intra-party factional conflict and repeated 'diktat' from the 'high command' leading to frequent changes of chief ministers, as witnessed by four changes in a five-year period preceding the 1983 assembly elections. As a reaction to these centralising tendencies in the Congress, a regional party emerged with a proclaimed objective to

TABLE 1: LOK SABHA ELECTION

represent the interests of Telugu people. N T Rama Rao, a popular film star, launched the TDP on March 29, 1982 which within nine months of its formation emerged victorious in the 1983 assembly elections by successfully rallying the non-Congress vote. The TDP won 202 seats out of a total of 294, whereas the Congress Party could secure only 60 seats. The CPI and CPM got four and five seats respectively. Only one seat went to the Janata Dal and three to the Bharatiya Janata Party (BJP) (Table 2). For the first time a non-Congress government was established. A similar pattern was discernible in the 1984 Lok Sabha elections which followed shortly, after dramatic developments at the state and national levels.² The Congress Party secured only six seats out of a total of the 42 it contested, with 41.8 per cent votes, whereas the TDP got 30 out of the 34 seats it contested with 44.8 per cent votes (Table 1). This was in spite of a sympathy wave in favour of the Congress(I) following the assassination of Indira Gandhi.

The emergence of NTR as a political force not only changed the course of political developments but also the very style of politics itself. "While Indira Gandhi broke patron-client ties at the local level, she herself emerged as the key patron. This trend initiated the process of 'depoliticisation' of party workers which ended in loss of credibility of Congress politicians. Thus, NTR, who was a newcomer to politics, enjoyed greater credibility than most men long associated with public life" [Reddy 1989]. Starting with the slogan of protecting the 'self-respect' of the Telugu people, which he claimed had been lost during Congress rule, he went on to unfold his specific programmes to promote the welfare of the Telugus. A mythological hero on the celluloid screen was transformed into a real life hero of the masses. He used the Telugu sentiment very well during election campaigns. He reached out to the masses by personally touring the state aboard his 'Chaitanya Ratham' – a campaign vehicle fitted with gadgets like a public address system. His

use of cassettes, posters and cut-outs symbolised new modes of effective political communication.

NTR's entry into politics also altered the traditional caste calculus in the state's electoral politics. The kamma caste, which has come to play a dynamic role in the state economy, could never secure a chief ministership during the Congress regime, though there were six chief ministers belonging to the rival reddy caste. NTR, being a kamma, could become a rallying point for the kamma groups by providing them with an opportunity to realise their political ambitions and demonstrate their potentialities. He tried to create a support base among the backward castes, rural poor and women by means of several populist policies and by facilitating their accommodation in the power structure.

An event of critical significance to the consolidation of NTR in state politics was the revolt of a section within the TDP in 1984. Nadendla Bhaskar Rao, NTR's finance minister, revolted against NTR and became the chief minister with the support of the Congress after having got NTR dismissed from the chief ministership. NTR went back to the masses with an appeal to 'save democracy'. He was re-instated in power within a month because of massive public protest. But he recommended the dissolution of the assembly and fresh elections were conducted in March 1985. This time NTR entered into seat adjustments with non-Congress(I) parties like CPI, CPM, Janata and BJP. NTR's TDP cornered as many as 202 seats, more than what it had bagged in 1983; the Congress could secure only 50 seats. With this massive mandate, NTR went ahead with a vengeance to introduce his welfare schemes and administrative reforms. He became very popular with his subsidised rice scheme, which provided rice at Rs 2 a kilo for the poor and a slab rate of electricity for the farmers. To strike at an important institutional support base of the Congress, NTR abolished the village officers system, 'patel-patwaris', and to make the bureaucracy responsive to the people NTR initiated administrative

decentralisation by dismantling revenue taluka and panchayat samitis.³

The next assembly and Lok Sabha elections were held in 1989, in which the TDP lost its dominant position to the Congress(I). The latter bagged 181 seats in the assembly and came back to power after a gap of seven years. The TDP won only 74 seats. Similarly, in the Lok Sabha elections, the Congress Party secured 39 out of 42 seats and 51 per cent votes whereas TDP secured a mere two seats and 34.5 per cent votes. This position of the Congress Party suffered a setback in the 1991 Lok Sabha election when it won 25 seats and 45.6 per cent votes. While the TDP increased its share to 13 seats and 32.3 per cent votes (Table 3). This election marked also the entry of the Bahujan Samaj Party (BSP) into the election fray in Andhra Pradesh. It contested 77 seats, but could not secure even a single seat. Though the Congress Party came back to power it did not seem to have learnt anything from its past mistakes. It continued with the old culture of internal bickerings and factional conflicts resulting in frequent change of chief ministers. These factors in a significant sense contributed to the TDP's comeback to power in the 1994 elections.

In the assembly elections of December 1994, the TDP swept the polls capturing a massive 217 seats (251, if the share of its allies, CPI and CPM, is added) out of a total of 292 seats for which elections were held. The Congress Party won only 25 seats. The vote share of TDP and its allies was 49.5 per cent compared to 33.2 per cent of the Congress. In the coastal region, the TDP won 105 seats out of a total of 133 seats, compared to the Congress Party's poor performance in securing only 10 seats. In Telangana region, the TDP won 69 seats out of a total of 107 seats. The Congress could secure only six seats, the lowest ever. Out of a total of 52 seats in the Rayalaseema region, the TDP secured 40 seats compared to 10 of the Congress. The TDP also established its strong presence in the SC and ST constituencies. Out of a total of 39 SC seats, it won 28, while the Congress won

only two. CPI and CPM, the TDP's allies, got four and five seats respectively. All the 14 ST seats were captured by the TDP and its allies.

Strategic to the TDP's overwhelming victory in the 1994 assembly elections were the promises of prohibition, subsidised rice, allotment of house sites and the supply of subsidised janata cloth. These promises could capture the imagination of the weaker sections, especially the SCs, and OBCs. Crucial to the analysis of this appeal are the statewide women's movements against arrack and the dilution of the subsidised rice scheme during the Congress rule (1989-94). As a result, the Congress campaign that these welfare programmes cut into developmental expenditure did not cut much ice. In any case, benefits from developmental programmes are not likely to be as tangible as those from welfare schemes. That most of these subsidy expenditures were extracted from the excise revenues and that there could be a difficulty in continuing either the welfare schemes or NTR's new slogan for total prohibition, did not register in the minds of voters. On the contrary, a combination of both the schemes appealed to the electorate, especially the women voters in rural areas, most of whom voted for the TDP. In the 1994 elections, there was also a clear shift of Muslim votes from the Congress to the TDP. It could be because the Muslims in the state held the Congress(I) and the BJP equally responsible for the demolition of the Babri masjid. Added to this, NTR's earlier tenure as chief minister (1983-89) was remarkable for its maintenance of communal harmony.

The entry of BSP into state politics in a big way during the 1994 assembly elections raised some hopes of a third force in the state. BSP supremo Kanshi Ram generated initial euphoria among the SCs, STs and OBCs by raising the slogan of political power to 'bahujans' (majority). There was anticipation that the BSP would be able to cut into the fortunes of both the Congress(I) and the TDP [Srinivasulu 1994]. It could not win a single seat though it contested from 218 constituencies. In fact, all candidates except one lost their deposits. Only 12 candidates could secure more than 5,000 votes. The failure of the BSP to take off in the state's politics could be attributed to the disenchantment in the ranks because of the arrogance and authoritarian attitude of Kanshi Ram. But his attempt to organise the votes of the weaker sections under one banner might have a lasting impact on the state's politics in the future.

III NTR's Legacy and 1996 Elections

Crucial to the analysis of the 1996 Lok Sabha election in the state are: the removal of N T Rama Rao from chief ministership in August 1995 and his death four months later. After NTR's comeback to power in 1994, the TDP which had all along appeared as a monolithic organisation under the total grip of the supremo, saw an internecine struggle in its rank and file which finally culminated in the coup against NTR. The chief reason for this was the perception among NTR's family members of an increasing political hold of Lakshmi Parvathi. NTR's biographer-turned-second wife, over NTR. NTR's son-in-law, Nara Chandrababu Naidu, supported by family members, successfully rallied the support of 190 MLAs and forced NTR to resign from the chief ministership, and himself assumed the leadership of both the party and the government. Though this coup resembled the one engineered by Nadendla Bhaskar Rao in 1984, this time there was neither a sympathetic press nor any significant popular protest to bring NTR back into power.

Further, with NTR's death on January 18, 1996 the political scenario in the state changed significantly. The family members, who had earlier quarreled for power, now started fighting not only for his dead body and property but also for his political legacy. Naidu, with the power of state government in hand, had already walked away with the support of the rank and file of the party. He was determined to show that the TDP electorate were also with him. Lakshmi Parvathi, heading the NTR faction now named TDPLP, on the con-

trary, wanted to prove that the mandate of the 1994 assembly elections was for NTR and that the same electors would legitimise her own choice as NTR's political heiress.

Thus by the accident of circumstances Lakshmi Parvathi emerged as a new player in Andhra Pradesh politics. Her only political capital was the popular sympathy at NTR's demise: she carved out a niche for herself, however, by adding to this her own oratorical skills. She went round the state exhorting people to undo the injustice meted out to her husband and vanquish the 'back-stabbers'. Public response was unprecedented, as evidenced in her first public meeting 'Simha Garjana' (lion's roar) in Vijayawada, followed by 'Ugrashankharavam' (clarion call) in Tirupathi. Almost all the national leaders of Janata Dal threw their weight behind her, even if it was only to show respect to the departed leader of the National Front. Given this political scenario, many political commentators confidently predicted that she might sweep the polls. But the absence of any capable organiser or strategist in her party who could translate the sympathy factor into votes was her major disadvantage.

Chief minister Naidu, an astute politician, was keenly looking forward to the Lok Sabha elections in order to establish his credibility and prove his claim of being the true and rightful political heir of NTR. Indeed, he was to face elections for the first time as the leader of his party. His and his party's destiny depended on the outcome of these elections. He got a shot in the arm when the Election Commission recognised his faction of TDP as the real TDP and was renamed as TDPN, NTR's

	Vote	2.6	4.2	3.8	1.7	6.5	10.5

Note: 'Vote' is per cent to total vote cast.

election symbol, the bicycle, was also allotted to Naidu. He tried his best to continue all the populist policies associated with NTR. He consolidated his position by deciding to give 10 lakh new cards for subsidised rice and distribute forest land to the poor through the co-operatives. Government programmes like 'prajala vaddaku paalana' (government to the doorsteps of the people) and 'shramdanam' (contributory labour) were used as vehicles to reach out to the people.

The left parties, the CPI and the CPM, which have been sailing with the TDP since 1984, sided with Naidu. By supporting Naidu they could get not only easy access to him but also by allying with the TDPN retain at least the two seats they had in the last Lok Sabha. That their gamble paid off was clear from later developments.

Political contestation as far as the rival Telugu Desam groups were concerned was for the political legacy of NTR. As a result, NTR's main political plank, ever since he launched the TDP, of 'anti-Congressism' got considerably diluted.

This was to turn out in favour of the Congress(I). In the Lok Sabha elections of 1991 the Congress Party had won only 25 seats, 22 of which were won after the assassination of Rajiv Gandhi in the middle of the election process and hence with a possible sympathy wave. This was followed by the 1994 assembly elections where the party was trounced. NTR clearly hoped to repeat this performance during the Lok Sabha elections. But the sudden demise of NTR and the developments in the TDP camp considerably brightened the prospects of the Congress(I). It is no exaggeration to suggest that the more the division in the TDP votes, the better would be the performance of the Congress. In fact the Congress Party has been commanding a solid votebank in Andhra Pradesh. About one-third of the voters were committed Congress supporters who have lent support to the party in the successive elections since 1983 whether there was an NTR wave or not. The Congress leadership was so assured of success that it made hardly any efforts to patch up its internal dissensions. This was in spite of the fact that winning a sizeable number of seats from the state was very crucial to the party's overall strategy of retaining power at the centre. Andhra Pradesh being the home state of P V Narasimha Rao, the party's performance in AP was watched all over the country and hence the political stakes for the Congress Party were quite high.

The rest of the political parties have been only minor players in the political

battle. The BJP and MIM have their major support bases only in the Hyderabad-Secunderabad area. The BJP has been trying to expand its support base and had contested in 40 constituencies in the 1991 Lok Sabha elections but could win only the Secunderabad seat. It did, however, win an appreciable number of votes in many constituencies, especially in the Telangana region. But it was expected that minute caste calculations in the state could overturn the hindutva plank of the BJP. The Janata Dal, which was an ally of the TDP in the 1991 elections, had fared miserably and had hardly any organisational strength left to activate itself in 1996.

The 1996 elections, the first election in the post-NTR phase, were intensely fought for the political legacy of NTR by both the TDP groups. Lakshmi Parvathi, following NTR's practice, launched her campaign from the temple town of Tirupathi. In her 'Taraka Rama Chaitanya Ratham' – a modified version of the campaign vehicle made famous by NTR – she travelled throughout the state holding big rallies as well as street corner meetings. She proved to be a great crowd puller, especially in rural areas. Though she lacked the electrifying appeal of NTR, she had enough oratorical skills to enthuse the crowd to listen to her. She appealed to the emotions of the voters by playing a recorded speech of NTR which called Naidu and his group of MLAs 'traitors'. She sought help from the people for what she called 'Naraasura Samhaaram', which means elimination of the demon Nara (referring to Nara Chandrababu Naidu). She tried to convey the message that NTR was the victim of back-stabbing by his own family members and that NTR had wanted the back-stabbers to be taught a lesson. Parvathi's earlier experience as a 'Harikatha' artiste helped her to captivate the masses. She had learnt well NTR's skill of turning adversity into advantage. For example, when she lost the 'bicycle' symbol to the rival faction, she asked the people to vote for her new 'lion' symbol because the bicycle has been stolen by the thieves.

While Parvathi imbibed many aspects of NTR's style of campaigning, she con-

veniently forgot NTR's most important plank, 'anti-Congressism'. She invariably projected herself as anti-Naidu and never as anti-Congress. In fact, there were even rumours that she might support the Congress Party after the elections. It was evident that she lacked the knack, experience or sane advice to convert the sympathy into votes. While her crowd pulling abilities were extolled by the media, different phases of CSDS pre-poll surveys⁴ revealed that her support base among voters was only between 5.45 per cent and 9.67 per cent. Several of NTR's key organisers at the local level had already deserted her and she had very few effective middle level leaders.

Naidu on the contrary displayed meticulous planning and execution of electoral strategy. Naidu made all possible efforts to project his closeness to NTR and his policies. He freely used NTR's portraits and speeches to whip up voter enthusiasm. While NTR's photograph found a place on the cover of Naidu's election manifesto, he selectively used the speeches where he was praised, especially the one NTR made after his reinstatement as chief minister in 1984, "Chandrababu Naidu is an astute politician. But for his struggle, the Telugu Desam would not have been reborn. I will never forget his services" (*India Today*, May 15, 1996:66). Naidu's oratorical skill and crowd pulling capabilities were poorer compared to that of Parvathi. But he tried to make up by using the private satellite channels to reach the electorate in remote villages. Parvathi did nothing to counter this propaganda, not even by showing a clipping from NTR's press conferences denouncing his son-in-law. Naidu used the election as an opportunity to widen his party's organisational network. He made his MLAs personally supervise the party's campaign in their respective areas. He tried to galvanise the civil servants to create an impression that his is a responsive administration. He tried to prove time and again that he was continuing with the populist welfare policies associated with NTR. That Naidu benefited from the continuation of NTR's policies of prohibition and subsidised rice scheme is clear from Table 4.

TABLE 4. PRE-POLL SURVEY RESULTS

(Per cent)

Party	Support for Prohibition among Political Party Supporters		Beneficiaries of Rice Scheme	
	Approving	Disapproving	Beneficiaries	Non-Beneficiaries
INC	44.5	57.8	38.3	53.6
TDPN and allies*	45.4	28.5	49.5	33.2
Others	12.0	13.8	13.8	13.2

Note. * CPI and CPM

Source: Pre-poll survey, CSDS, 1996.

Perhaps he could convince the people regarding the continuation of welfare and developmental programmes which stood in stark contrast to an essentially negative campaigning by Parvathi. It is no wonder, therefore, that Naidu got the votes while Parvathi got the crowds.

Complacency in the Congress camp was quite evident throughout the campaign. It had no novel programmes to announce, nor any charismatic leader to project. It did not display any well planned campaign strategy. It was bogged down in its own internal factionalism so much that it could not contain dissidence even during this crucial period. Several senior leaders had to be suspended right in the middle of campaigning. The sorry state of affairs in the party was evident from the episode in Karimnagar where a former chief minister, K Vijayabaskara Reddy, was humiliated by a section of Congressmen in the presence of the party president and then prime minister, P V Narasimha Rao. Hence, it was clear that the Congress Party in the state was simply waiting to collect the spoils of the war between the two factions of TDP. Its complacency was increased by media projections that it could sweep the polls with a tally of 40 seats out of a total of 42 if it could just manage to keep its 1991 support level intact (*India Today*, April 30, 1996:62). But it was not an easy gamble, as Congress leaders might have realised later.

Thus there were three major players in most of the constituencies: the Congress; TDPN and its allies, CPI and CPM; and TDPLP supported by Janata Dal and BSP.

As before, caste calculations had gone into the process of nomination of candidates by different political parties. The reddy, who are traditionally identified with the Congress(I) bagged 12 of its nominations for the 34 general category seats. TDPLP selected 10 reddy and 12 kamma and was therefore dubbed as an upper caste party. The rival TDPN, following the time-tested strategy of NTR, tried to court OBCs, who constitute 44 per cent of the state population. Naidu nominated as many as nine OBC candidates, besides a judicious selection of reddy and kamma depending on their strength and influence. Naidu even picked up an ST candidate in Warangal against a powerful reddy candidate of the Congress(I) and a backward caste candidate in the velama dominated Karimnagar constituency. TDPLP's selection of candidates, in contrast, was not based on any reasoned political calculus. For instance, the party chose to give tickets to rich and influential persons of forward castes in constituencies where the weaker sections are domi-

nant. This in spite of the fact that the OBC voters who have traditionally supported NTR were expected to be crucial decision-makers in the choice between the two TDPs. It was clear that while the Congress and the TDPN kept the caste arithmetic in view in the process of nomination of candidates; the TDPLP looked for candidates with greater local influence.

The results of the 1996 Lok Sabha elections in AP reflect the resolution of the contestation between the TDPN and TDPLP for the legacy of NTR in favour of Naidu. The Lakshmi Parvathi group, though it garnered 10.6 per cent popular vote, failed to convert this into seats. The Naidu group securing 16 seats and its allies CPI and CPI(M) two and one seats respectively together with 37.9 per cent vote could succeed in establishing its supremacy vis-a-vis the Lakshmi Parvathi group. The major beneficiary of the battle between the two TD groups following the split in the party was the Congress(I).

The Congress Party's performance in AP would seem to be spectacular if seen in the overall context of the debacle of the party throughout the country. The voters of AP have a reputation of being different from the national mainstream. In 1977, when the Janata Party made a clean sweep all over the country, AP elected 41 Congress MPs out of a total of 42. Again in 1984, when the Congress had a massive lead throughout the country, TDP and its allies had won 35 seats. In 1989, when the Congress lost power at the centre, AP sent 39 Congress MPs to Lok Sabha. Electoral politics in AP has been different, so also have the strategies, calculations and predictions associated with it.

In the 1996 election, the Congress polled 39.7 per cent votes and won 22 of 42 seats. This was much less than the 31 seats it held in the previous Lok Sabha⁵ and was measly compared to the early predictions of a clean sweep in the state. But if the votes of the two TDP groups were to be aggregated, the Congress would have won in only six constituencies. Moreover, the TDPN and its allies could wrest as many as 15 seats which the Congress had held in the last Lok Sabha. The Congress in turn could wrest only four seats from the TDP.⁶ The split of the TDP votebank between the rival groups thus benefited the Congress(I). This is evident from the fact that the two TD groups together polled 43.2 per cent which equals what the undivided TDP secured in 1994 assembly elections.

The BJP which lost its lone seat seat of Secunderabad to the Congress, got a second position both in Hyderabad and Secunderabad and a third position in six other constituencies. The sensitive Hyderabad seat was retained by Sultan Salahuddin Owaisi of MIM. The voting pattern in Hyderabad constituency suggests that while MIM had a strong support base in the four urban segments, the BJP consolidated its position in the three rural segments, sometimes at the cost of the two TDP groups.

If we make a regionwise analysis (Table 5), the performance of the TDPN and its allies in the coastal region was better than expected. They could secure 11 seats out of a total of 21 compared to 10 seats of Congress. On the other hand, the Congress Party's share in the Telangana and Rayalaseema regions was better than

Source: CSDS data unit.

that of TDPN and its allies. In the Telangana region the Congress Party secured eight out of 15 seats compared to six of its adversaries. In the Rayalaseema region the former won four out of six seats compared to two of the latter. But the performance of the Congress Party in Rayalaseema region in 1996 was worse than that in 1991, when it had won all the six seats. Its vote share also declined here, from 59.7 per cent to 43.1 percent, though it has improved compared to its share of 37.4 percent, in the 1994 assembly elections. Its vote share declined also in the coastal region, from 47.1 per cent in 1991 to 41.1 per cent in 1996, but has increased from 37.1 per cent during the 1994 assembly elections. Its support base in the Telangana area remained more or less the same at a little over 37 percent, both in 1991 and 1996, which is considerably more than its share of 27.6 per cent in the 1994 assembly elections. Surprisingly, the vote share of TDPN and its allies in both the Telangana and Rayalaseema regions, in the 1996 elections is more than that of the undivided TDP and its allies in 1991 elections, though for obvious reasons it is less than that of 1994 assembly elections. While in Telangana its vote share increased from 29.1 per cent to 33.2 per cent, in Rayalaseema it went up from 33.2 per cent to 44.8 per cent. In the coastal area it marginally declined from 42.9 per cent to 39.4 percent.

In the general and ST constituencies, both the groups, the Congress and the TDPN and its allies, were more or less evenly placed in terms of both seats and votes (Table 6). But in SC constituencies, the Congress had a distinct edge. It won five out of a total of six seats. Its vote share was 42.7 per cent compared to 37.6 per cent of the latter. It seems that the Congress continues to maintain its support base among the scheduled castes.

There does not seem to be a remarkable shift in the caste composition of the MPs after the 1996 election or of MLAs after the 1994 election. As before, the reddy and kamma are overrepresented. About 26 per cent of the representatives are reddy, whereas they constitute only 6 per cent of the population. Similarly, about 16 per cent of the representatives are kamma, who are only 4 per cent of the population (Table 7). These two communities have steadily maintained their share among the state's MLAs and MPs at these levels since independence [see Reddy (1989) for comparative data on other elections]. The share of brahmins is declining gradually. The proportion of backward caste MLAs and MPs has remained more or less at the

same level as before; but it is very low compared to their strength in the population. Out of the seven backward class MPs, six belong to the TDPN and its allies and one belongs to the Congress Party. Eight out of 11 reddy belong to the Congress and only three to its rival. But the latter has four out of seven kamma MPs from the state and the rest belong to the Congress Party. Though both have shared one seat each in ST constituencies, the TDPN could manage to get one of its ST candidates elected in a general constituency at Warangal. Thus no political group is dominated by an exclusive caste category. However, higher proportions of reddy and SCs are found in the Congress and those of kamma, BCs and STs in TDPN and its allies.

The CSDS 1996 post-poll survey provides us some useful clues to understand the socio-economic background of the supporters of different parties. Though the survey data does not indicate a distinct polarisation of political forces on the basis of any single parameter, it is possible to discern some general trends. Among the SC voters the Congress Party had a larger support base whereas a larger share of ST votes had gone to the TDPN. The latter had a slight edge in the support of OBCs. But among the upper castes, the Congress continued to get a higher level of support. No other political party, including the TDPLP, could claim a sizeable following in any specific category of voters (Table 8). We might infer from these data that while NTR's supporters among the OBC and the ST groups have transferred their loyalty to Naidu, those among the SC groups have moved over to the Congress Party. The survey confirms the established notion that the TDP has its stronghold among the rural electorate and especially among the women due to NTR's policies of welfare

and prohibition. These segments could be seen to have shifted their allegiance to the TDPN in the keenly contested 1996 elections.

In the absence of any large group of people who identify themselves with any political party,⁷ it is difficult to conclude whether any of these traditional support bases are going to be stable. This doubt is reinforced when we examine the 1998 electoral outcome.

IV Drifting Social Support: 1998 Elections

The elections to the Lok Sabha in 1998 within two years were a consequence of the fractured verdict in the 1996 elections. The formation of an unstable government by the United Front of 13 parties with outside support by the Congress(I) has been instrumental in bringing the regional parties to the centre of Indian politics. The historically dominant Congress Party has been reduced to certain pockets of the country and its relevance made proportionate to its ability to reflect the aspirations of the regions. The apparently fragmented verdict of the 1996 elections, mirroring the process of regionalisation of Indian politics, signals the celebration of autonomy and distinctness of different regions that have been characterised by differential historical, linguistic and socio-economic background.

It is in this context, that the TDPN has come to assume a significant role in the unfolding theatre of politics at the centre in the period following the 1996 elections. The TDPN, though it had just 16 MPs in the 11th Lok Sabha, played a key role in forging a non-Congress(I) and non-BJP coalition at the centre by actively negotiating with the time-tested and fairly successful strategy followed by the undivided

TABLE 6: CATEGORYWISE ANALYSIS: LOK SABHA ELECTION

TDP under NTR's leadership. It may be recollected that it was NTR who, after his coming to power in 1983, initiated the process of forging a national alternative through a series of conclaves of the non-Congress parties. NTR followed a two-pronged strategy of: (a) forging an anti-Congress alliance with the left in the state; (b) pursuing the politics of the non-Congress coalition at the national level. The culmination of this was the formation of National Front of which NTR was the chairman till his death. By actively participating in this process Naidu sought to demonstrate his conformity to NTR's legacy and carve out a niche for himself in the national politics.

But the major changes to be found were initiated in the policy domain soon after the 1996 elections. It is here that the increasing distance of Naidu's government from NTR's regime has to be seen. Emerging confident from its performance (vis-a-vis that of TDPLP) in 1996 elections, legitimised by the support of the left and further propelled by its newfound place in the national politics, the TDPN government initiated a public dialogue on some of the quintessentially NTR schemes and policies like Rs 2 a kilo rice scheme and prohibition policy as a preparation for policy changes. As analysed earlier, these policies were crucial in NTR's comeback to power in the 1994 assembly elections. NTR's mandate in 1994, needless to say, was hinged on his commitment to implement them in spite of the problems of resource mobilisation.

The support for NTR among the popular classes was derived from these populist policies. In contrast, the urban middle classes have generally seen NTR's policies as being detrimental to the development of the state. This obviously lent credence to the view that the total prohibition and Rs 2 a kilo scheme were major causes for the fiscal crisis of the state.⁸ Further the flow of illicit liquor into the state is seen as an evidence of the impracticality of the proposition of total prohibition. The public dialogue exercise initiated by the Naidu government vindicated this view.

Following the opinion mobilisation exercise and as a measure towards the improvement of the state's fiscal position TDPN government introduced modifications in the prohibition policy and subsidised rice scheme. Thus prohibition was partially lifted and the price of subsidised rice was hiked from Rs 2 to Rs 3.50 a kilo and the quantity was reduced from 25 kilos to 16 kilos per family. In addition the hike in slab rates on electricity and

water cess for agriculture were effected. These policy changes were part of the larger agenda of economic reforms in the state that made a departure from the policy framework of NTR's regime [Srinivasulu 1998].

The broad consensus among the political parties, cutting across ideological persuasion, posed no major problem to the TDPN in pursuance of its reform agenda. But it was not to be the case with the left parties. But their being 'friendly opposition' forced them to remain silent on these crucial issues.

The elections to the Lok Sabha in 1998, occasioned by the fall of the UF government following the withdrawal of support by the Congress(I) was something neither the AP Congress(I) nor the TDPN was prepared for. Finding themselves once again in the electoral fray, these two major players in the state politics displayed visible disinterest as there could be no substantial issues with regional relevance for them to focus their attention on, except for their traditional mutual opposition.

The BJP, which had lost even its lone Secunderabad seat in 1996 elections, in contrast, displayed enthusiasm and dynamism. The BJP, it may be recollected, in spite its meagre presence in most of the constituencies, contested almost all the seats since the 1991 parliamentary elections. What marked it out this time obviously was its success in attracting a number of cinema stars and dissidents not only from the TDPN but a significant chunk also from the Congress(I) on the eve of the elections. The BJP's campaign this time was in fact star-studded with all the glamour and hype that goes with the Telugu commercial cinema. But what the BJP tried to harp on was the slogan of 'able leader and stable government'. By focusing on the failure of the UF coalition to provide a stable government – in which

TDP was a partner – and the opportunist support to it by the Congress(I) from outside, the BJP vigorously projected Vajpayee as the prime ministerial candidate to convey the message that it alone could be a better bet for stable government.

In the Congress (I) and the TDPN camps, especially at the grass roots, one could see a sense of exhaustion. The dynamism and issues that dominated the 1996 electoral campaign were missing this time. In a sense, the campaign issues in 1998 were a mere repeat of that in 1996. While for the Congress(I), the coming of the elections so soon was largely its own making, for the TDPN, the failure of UF experiment was enough to dilute its enthusiasm. If the context of the 1998 elections, for the reasons stated above, put both the Congress (I) and the TDPN at a disadvantage, the BJP tried to turn this to its advantage and more specifically the BJP tried to gain sympathy from its government's collapse after 13 days in power in spite of being a major party as a result of the actions of the Congress(I) and UF partners.

If exigencies of the 'hung' Lok Sabha constituted one dimension, then the regional issues centred around the governance of the TDPN and its policy reversals constituted another significant dimension of the electoral campaign. Thus the BJP focused on the TDP's failures. The BJP's star campaigners were most vocal on the TDPN's back-out from its stated adherence to NTR's policies. Further, what enthused the BJP in this respect was its alliance with the TDPLP. There were the suicides among cotton farmers in the northern Telangana districts during 1997-98 due to the successive failure of cotton crop on account of the failure of governmental agencies to provide extension services, to supervise quality control of seeds, fertilisers, pesticides and other

TABLE 7: CASTE COMPOSITION OF MLAs AND MPs IN ANDHRA PRADESH

Caste	Per Cent in Population (Approx)	MLAs in 1994 Elections		MPs in 1996 Elections	
		Number	Per Cent	Number	Per Cent
Brahmin	3.0	1	0.3	2	4.8

Note: * One ST candidate was elected in general category constituency.

inputs [Andhra Pradesh Rythu Sangham 1998; *Vaaritha*, February 16, 1998, Hyderabad]. This in turn is seen to be a consequence of the liberal reforms. The failure of the government to respond to the crisis in any significant way, as the suicides continued, was sufficient ground for the BJP and Congress to target the TDPN during the election.

Though the Congress made the policy reversals by the Naidu government the central issue, its lack of conviction and absence of any policy alternative was quite conspicuous. What was transparent in this election was an unprecedented enthusiasm for the BJP not only among the middle classes but also in the farming community in northern Telangana as well as in coastal districts. The message that seems to have gone well with them this time was the BJP's stability plank. Thus 'let us give a chance to the BJP' was the refrain often heard during the campaign (field interviews, February 1998).

In the social background of the candidates fielded by both the TDPN and Congress(I) there was no significant change from 1996. While the Congress(I) had shown a preference for candidates from the dominant peasant castes of reddy and kammas, the TDP as in 1996 fielded candidates from OBC background. In addition, the Congress(I) contestants list included a number of new candidates leading even to the exclusion of incumbents. This could be seen as a reflection on the factional infighting in the party. In contrast, the TDPN displayed greater continuity and stability.

For the first time the BJP has made its mark on the political scenario of the state in a big way through considerable gains in terms of popular vote and seats. This election has seen a considerable shift in the social support of the almost all the parties. This turned to the advantage of the BJP. Its convincing victories in four constituencies, two each from Telangana and coastal Andhra demonstrates this. Thus, besides its traditional stronghold of Secunderabad, it won Karimnagar seat from the TDP in Telangana. In this velama dominated constituency, for the first time in its history, a BC candidate won on the TDP ticket in 1996. The BJP fielding a velama candidate defeated the TDP incumbent and a veteran Congress(I) candidate belonging to the velama community. Thus the BJP got one each from the TDP and Congress(I) and came second in as many as three constituencies in this region.

The BJP's gains in coastal Andhra, considering the fact that this region had

never witnessed any communal tensions and that BJP's popular vote percentage was just 1.9 in 1996, deserve serious attention. Thus it would be instructive to analyse the factors contributing to the successful garnering of two seats, one each from the TDP and the Congress(I) in this region.

If the alliance with the TDPLP was a major factor in the BJP's performance, assuming that a substantial proportion of its 10.7 percent support in 1996 has shifted to the BJP, the gains from the TDPN and Congress(I) could be no less important. Mudragada Padmanabham, a dissident Congress(I) leader belonging to the kapu community, with a considerable influence in the two Godavari districts not only among the kapus but also among other communities, joining the BJP on the eve of the elections, considerably tilted the support base of the Congress(I) to the BJP. This is evident in the fact that in Rajamundry and Kakinada, won in 1996 by the Congress(I) and TDPN respectively, the Congress(I) has been reduced to a third position.

Though the Congress(I) has maintained its balance sheet by winning 22 seats this time as well, it has seen a significant shuffling of seats. It could win only 12 of the seats it won in 1996 and lost as many as eight seats to the TDP and allies and two seats to the BJP. In turn it gained 10 seats from the TDP compensating even for its losses to the BJP.

What is worth noting about the performance of the Congress(I) are the upsets it suffered in the reserved constituencies. While it won five of the six SC constituencies and one of the two ST constituencies in the state, this time it succeeded in winning only in three SC reserved constituencies. It lost the ST seat it held last time.

If the replacement of the candidates and denial of tickets to the incumbents is one reason for the seat changes of the Congress(I), then the deeper changes in the socio-political context could be another. Though it is difficult to say anything definite about the changing social bases of the Congress(I), a significant drift in its social support could be observed. The shifts away in two significant social constituencies of kapus and madigas in the Congress(I) social coalition could be seen as indicative of the changes in its support base.

If the Mudragada factor was critical to the shift of the kapus away from the Congress(I) to the BJP in the coastal districts, the schism in the traditionally Congress supporting scheduled castes

along the mala-madiga caste line substantially eroded Congress support. The agitation of the madigas for the categorisation of the SCs into four groups for the benefit of reservations in education and employment took a serious form after the 1996 elections. The madiga reservation struggle against the existing policy of reservation for the SCs that has benefited the malas disproportionately to their size in the SC population has been supported by the TDPN government. Its promise to strive for the necessary modification had led to the rallying of the madigas around the TDPN thereby ensuring the political polarisation of malas and madigas on party lines [for an analysis of the dalit movement see Srinivasulu 1999]. As a result of this, with a substantial section of the madigas shifting to the TDPN, the Congress(I) could be said to have substantially lost its base among the madigas. Though it is difficult to assess the impact of this polarisation on the political process, it would not be an exaggeration to say that it was one of the factors which had contributed to the shuffling of the seats in 1998.

Source: Post-poll survey, CSDS, 1996.

Concluding Remarks

The state projects a seriously contested electoral scenario with the TDPN and Congress(I) competing for power with approximately equal support bases. In this situation the probability of alteration in power is very high. Whichever group is in power tends to dominate, though for a limited period. The Congress(I) lost its monopoly of holding on to power in 1983 but continued to be an important player in state politics.

The second party which dominated the electoral scene both in 1996 and 1998 was the TDPN and its allies CPI and CPI(M). The contest for NTR's legacy by the TDPN and TDPI.P has been settled in favour of the former and this has been vindicated by its electoral performance in the last two elections and further by the decimation of the TDPI.P.

The analysis of the 1996 and 1998 Lok Sabha elections provides interesting trends in the politics of the state. Seen against the background of the long-term alignment of political forces which began with the emergence of the TDP in 1983 and consolidated over the years with significant shifts in the support of the OBCs, STs and also the Muslims towards the TDP, the last two elections show certain volatility and uneasiness in these social groups.

Though in 1996 the Congress(I) and the TDPN could largely retain the support of the constituents of their respective social coalitions, in 1998, in contrast, there could be witnessed a marked departure. The seat changes and swings in the vote margins of these parties across regions and constituencies could be read as indicative of significant shifts in the social support of the Congress(I) and the TDPN. The process of increasing articulation of aspirations and interests by different social groups, especially those in the subaltern ranks, through both issue based movements and leader centred mobilisation can be said to have contributed to the volatility of their electoral support. This has rendered the social coalition of support of both the parties critical.

In this process the political parties which, dictated by the exigencies of their electoral calculus, have directly or otherwise encouraged specific caste articulation could find themselves at the receiving end. The case of madigas illustrates this. If the support of the madigas could be rallied successfully by the TDPN in the 1998 elections with its promise to fulfil their demand for the SC categorisation, its

failure to do so in the meantime turned the madigas against it subsequently. In varying degrees it is true of other communities and their allegiance to political parties. In such a situation even denial of party ticket to a particular community could become a sufficient reason for the withdrawal of its support. The case of the kapus in coastal Andhra is an instance of this.

If the overall performance of the BJP in the 1998 election is an outcome of the contextual specificity of this election, then its dramatic gains are indicative of the disequilibrium in the social coalitions of the TDP and Congress(I). Though the BJP succeeded in rallying the support of a significant section of Andhra electorate, its victory in the four constituencies is largely due to the weakness of the main rival party in these constituencies. The seat changes witnessed between the last two elections, which have been between the TDPN and the Congress(I), vindicate the inference that support bases of the two dominant rivals is fluid and the electoral pendulum can swing in favour of either of them.

Yet it would be pertinent to note that the unstable nature of existing social coalitions of support of the two major parties and the resultant political volatility provides space for alternative articulation. In the absence of such a possibility, the social forces, needless to say, would settle down in the existing political equation, perhaps with some alterations.

Notes

- 1 There are 10 districts in Telangana, nine in coastal Andhra and four in Rayalaseema. Coastal Andhra has very fertile delta areas formed by the Godavari and the Krishna rivers. The Telangana and Rayalaseema regions, on the other hand, are backward regions with low agricultural productivity. Both these regions have vast natural resources which are largely unexploited. The Telangana region is industrially better off, though most of the industries are located in and around Hyderabad.
- 2 The reference is to: (a) the dramatic ouster of NTR from chief ministership by governor Ram Lal following the revolt in the TDP led by Nadendla Bhaskar Rao and NTR's subsequent comeback to power following massive public protest; and (b) the assassination of Indira Gandhi.
- 3 'Patel-patwaris' were traditional village officers: the former was vested with powers to maintain law and the order and the latter to collect land revenue. These hereditary positions invariably held by the upper castes: the former by the reddyis and latter by the kaminas, not only provided access to power and wealth but were also sources of corruption. Further they were traditional support structures of the Congress Party. By abolishing them,

NTR not only gained popular appreciation as these institutions had acquired notoriety of sorts in the perception of the popular classes but also struck a serious blow at the Congress support system. In their place NTR created village administrative officers to be recruited through open competition. Some of the patels and patwaris fulfilling the requisite qualifications were also accommodated. These reforms were part of the larger administrative reforms (which include the restructuring of the revenue and panchayat raj institutions) introduced by NTR during his first term (1983-89) in office [Srinivasulu 1990].

- 4 The first phase of the survey was conducted about one month before the election and the second one about 10 days before the election.
- 5 It had won 25 seats in 1991 election and six MPs joined the party later.
- 6 TDPN wrested 13 seats from the Congress. Adilabad, Srikakulam, Bhehili, Anakapalle, Kakinada, Machilipatnam, Chittoor, Karimnagar, Narsapur, Narasaraopet, Warangal, Nagarkurnool, Hindupur. Its allies, the CPI and CPI(M) wrested the Badrachalam and Kaminam seats respectively. The four seats wrested by the Congress are Guntur, Vijayawada, Anulapuram and Vishakapatnam.
- 7 Only 11.7 per cent of the respondents from AP felt that they were close to any political party during the 1996 post-poll survey conducted by the CSIS.
- 8 The white paper on the state of AP economy entitled, 'State Finances: The Factual Position' brought out by the state government (Government of AP: 1996) reinforces this view.

Shifting Political Loyalties in Uttarakhand

Pradeep Kumar

The people of Uttarakhand have broken from their traditional centripetalist politics and the movement for a separate state of Uttarakhand has become spontaneous, no longer dependent on politicians for mobilisation. This makes Uttarakhand a distinct political entity for analysis. The region has recently voted for the BJP as it had no other choice – it rejects Mulayam Singh Yadav's Samajwadi Party and any party that associates with it.

UTTAR PRADESH, the most populous and politically the most crucial state, is representative of India in more ways than one. Not only has it variously been referred to as the 'heartland' ('hridaya pradesh'), nerve centre of the political 'mainstream' and the like, it has also tended to monopolise 'centripetalist' politics in India. While many other states developed their linguistic, cultural or ethnic identities long ago, the only identity that UP has ever been familiar with has been the Indian identity, or in the narrowest sense the Hindi identity. Interestingly, the latter does not always refer to the Hindi belt and, in its broader version, is claimed to be symbolic of 'Indian identity'. While most other states/regions have derived their linguistic-cultural identifications from their respective regional languages, UP is seriously 'handicapped' in its lack of any region-specific language – Hindi being evocative of Hindustan, yet another name for India that is Bihar an entity much larger than UP.

It was the excessive emphasis on 'nationalist' and 'all-India' politics that hindered the development of UP as a region. In fact, one reason why it was kept intact as one state, despite its culturally heterogeneous and administratively somewhat unmanageable size, was its nationalist political ethos. The latter was considered to be a reasonable antidote to the possible emergence of the forces of vivisection and disintegration, released in the wake of the partition and the subsequent reorganisation of states on a linguistic basis. UP's tremendous diversity in terms of culture, dialects, geographical terrain and religious composition, etc., was considered to be insurance enough against the centrifugalism of the 'peripheral' zones. In other words, this multicultural state, supporting a huge population on a territory larger than that of many nation states of Europe, was supposed to act as an 'anchor' for the Indian nation state. It was this political belief, more than any other reason, that not only kept the state undisturbed all through the stages of reorganisation in the 1950s and the 1960s, but even encouraged the merger of three princely states with

it, after independence. These princely states were Benaras, Rampur and Tehri Garhwal. It is not as though the reorganisation process simply bypassed UP; it was its commitment to centripetal politics that made it so.

While it will be difficult, and even a bit out of context here, to make an evaluation of the role that the state eventually played in national politics in the last 50 years, it can be safely maintained that, of all the regions in the country, UP has continued to persist with its centripetalism, its continuous downward journey on the economic front notwithstanding. Surprisingly, despite decades of economic underdevelopment, there seems to have been hardly any serious popular support for the division of the state. Much of the protest against the jumbo size of this political conglomerate has come, ironically, from the 'outsiders', and there too, from among the intellectual circles, who in any case have very little contact with the ground reality in India. Moreover, the intention of these supporters of UP's division has invariably been 'to cut it to size', to curb its overrepresentation in the parliament, to which it sends 85 members out of the total 545. What, in fact, has deterred the successive governments from dividing the state is perhaps the absence of any genuine/serious mass-based demand for its division. Thus one of the four unwritten rules, which according to Paul R Brass, have governed the reorganisation of states in India, namely, the demand being supported by the popular assertion, has largely been missing in the case of UP until recently.

I

Uttarakhand as Political Region

Uttarakhand, comprising the 12 hill districts of the Garhwal and the Kumaon divisions of west UP, has been an exception of sorts. Even though what applies to other cultural zones of UP (like Bundelkhand, Rohilkhand, Awadh, Bhojpur and Doab) also applies as much to Uttarakhand, it may be worth noting that in addition, Uttarakhand has a distinct geographical identity which makes it much

more unique as a region than many others. Interestingly, some of these regions do not have even a strong self-perception of being a distinct entity and may have existed as regions more in the minds of linguists, social-anthropologists and psephologists. The Upper and the lower Doab are just two cases in point which perhaps would be difficult to identify if one were to depend exclusively on the technique of self-identification.

As against the cultural regions of the UP plains, Uttarakhand has remained more 'isolated' on account of its hilly terrain. The latter has even imparted it a historical identity. While most rulers of the plains could annex more and more territories and expand their territorial empires, thereby forcing their subjects to come under single administrative control, the mountainous districts remained perpetually 'inaccessible'. Even when some rulers were successful in bringing these under their subjugation, it was more a *de jure* subjection than a *de facto* one. Consequently, the hill dwellers remained more or less untouched by the upheavals in the plains. In fact many migrants from these plains, who became fugitives in wake of some of the invasions, (particularly those of 'Muslims'), sought refuge in these 'remote' sanctuaries.

Even though the movement for the creation of a separate hill state of Uttarakhand is sufficiently old, it did not gather mass support and largely remained submerged underneath the centripetalist politics of UP till recently. The region of Uttarakhand identified itself with the 'mainstream' of UP as it contributed three chief ministers to the state – more than its quota in terms of its population.

There has, however, been a major shift in the political thinking of this region in the last few years, and developments in these years have brought the issue of creation of a separate state on to the main agenda of electoral politics in the region. It is too complex a development to hazard the identification of any single factor or 'cause' as being responsible for the 'massification' of the demand for a separate state in these years. However, some

major political events which ignited the tinderbox can perhaps be identified without much hesitation. This identification is particularly important because of their direct impact on the electoral politics of the region. It is these events which we shall discuss later, which 'massified' the movement for a separate hill state and actually changed the political scenario in the region. The simmering discontent arising out of economic neglect could be converted into a movement powerful enough to exert pressure on the state and central governments, only after a series of events in 1994 and 1995 energised the masses. Even the existence of the Uttarakhand Kranti Dal (UKD), since 1978-79, had made very little impact on the politics of the region, although the party came into existence with the avowed aim of fighting for a separate Uttarakhand.

It all began in August 1994 when the agitationists who had been sitting on 'dharna' at the divisional headquarters of Garhwal in Pauri were forcibly removed by the administration on August 8. The agitationists were largely students, their parents and guardians, particularly women, some employees and political activists, who were demanding revocation of the UP government order to extend the 27 per cent reservations for the OBCs to the hill districts. The latter have almost negligible (2 to 3 per cent) OBC population and giving them a 27 per cent quota would have clearly meant inviting more people from the neighbouring plains to occupy the seats in educational institutions of the hills. This infuriated the people and sowed the seeds of discontent to which subsequently, the UKD volunteers also added the demand for a separate state of Uttarakhand. This demand was put forward as the only final solution to such anomalies created time and again by the government at Lucknow which had very little understanding of the peculiar problems of the hills. The difficult mountainous terrain and a distinct geographical character have made it difficult for the planners to imaginatively tackle the problems of the hill dwellers. However, the demand for a separate state could not have been so militant but for the mishandling of the agitation by the administration. The agitationists were beaten up, fired upon and sent to far away jails. This only reinforced their belief that they could not be treated well by the state machinery which was indifferent to their demands. To worsen the situation further, the firings at the Uttarakhand agitationists at Khatima, Mussorie and Rampur Ka Tiraha (Muzaffarnagar) resulted in deaths of many

young men and women. The climax came when the agitating people on their way to Delhi in connection with a national rally on October 2, 1994, were stopped near Muzaffarnagar, and the police assaulted them brutally. There were widespread allegations of the rape of women activists by the policemen themselves. The administration, which was then under the control of the Samajwadi Party-Bahujan Samaj Party (SP-BSP) coalition and its chief minister, Mulayam Singh Yadav, only added insult to injury by imposing curfew on several areas in the hills where people were not familiar even with a regular policeman. It is important to understand these details because, more than anything else, it is these events that created an anti-UP psyche in the hills. No amount of economic neglect and no amount of 'development of underdevelopment' had been enough to bring the region out of the centripetalist politics of UP. Regionalism, like in rest of the state, had remained until then, an anathema in the region, something equated with 'anti-nationalism'.

It is these developments that have, of late, given Uttarakhand a distinct political identity. It will not be an exaggeration to maintain that in the last three and a half years, Uttarakhand has developed its own identity in UP politics, thereby subsuming the hitherto prevalent Garhwali and Kumaoni identities. All steps to curb the agitation by the government have only added to the alienation of the region. Most of the victims of police firing have become 'martyrs' to the cause of Uttarakhand and numerous marble slabs have come up in many towns of the region that list their names in commemoration. Several public places (like chowks/parks) have been dedicated to them by the people. This indicates a stage where the movement has attained spontaneity, no longer dependent on small-time politicians for mobilisation. It is one of those rare cases where various political parties are trying their best to ride on the popular wave by appropriating and stealing the slogans of the masses. The agenda has been set by the people, and the political parties are vying with each other to respond to this. In short, Uttarakhand has, in a psychological sense,

seceded from UP. This naturally has implications for electoral politics.

This development makes sense if we treat Uttarakhand as a distinct political entity for our analysis and not any more as merely one subregion of UP. It surely qualifies the region for separate treatment here. No other region in UP would qualify for such a treatment in view of the lack of political assertion in the manner in which it has happened in Uttarakhand.

II Electoral Background of Uttarakhand

UP, one time bastion of Congress politics in India, has also the distinction of being the state which has witnessed its near total political annihilation in the last decade. Even a cursory look at the electoral tally shows that the Congress has experienced a continuous slide in its electoral support base, ever since the ninth general elections to the Lok Sabha (1989). Its support, in terms of votes polled, declined sharply after the eighth general elections (1984) when it had polled as high as 51 per cent votes, a figure which declined thereafter to 30.9 per cent (1989), 18.7 per cent (1991), 8 per cent (1996) and finally to its nadir a little over 4 per cent (1998). The figures in last three general elections have taken the party's electoral support to a level which is much lower than even the post-emergency decline when, despite all odds, the party managed to enlist 24.9 per cent voters' support in March 1977. The alliance of the Congress Party with the BSP a relatively young region-based party in UP in September-October 1996 assembly poll, and that too on humiliating conditions – the Congress getting only 125 seats out of a total of 425 – reveals its pathetically decline.

UP is currently undergoing the process of some kind of a political 'sagarmanthan' (churning), and the politically fluid situation at the moment points towards this uncertainty. Several new forces have come to the fore in last one decade or so. If hindutva became a symbol of mobilisation by the BJP, almost simultaneously the politics of backwards was given a boost by the Janata Dal and its various incar-

TABLE 1: LOK SABHA POLLS: UTTAR PRADESH (1984-98)

Year	Congress		BJP		BSP		SP
	Seats	Vote Share (Per Cent)	Seats	Vote Share (Per Cent)	Seats	Vote Share (Per Cent)	
1984	83	51.0	0	6.4	–	–	–
1989	14	30.9	8	7.4	2	9.4	–
1991	5	18.7	51	32.8	1	8.7	–

1998	0	4.0	58	39.2	4	21.8	20

nations. The dalits, who found themselves outside both these social and political forces, gathered around Kanshi Ram's BSP. Thus diverse pulls changed the support bases of almost all the political parties. The BJP, which was at one time confined to the upper castes, had to mobilise a sizeable section of the backwards (like the lodhas, the kurmis, etc), the Janata Dal and Samajwadi Party of Mulayam Singh Yadav, made particular efforts to enlist the support of Muslims who constitute a sizeable 16 per cent plus in UP, the BSP broadened its base to include several backwards among the backwards (i.e., the extremely backward castes among the OBCs) as copartners with the dalits. Interestingly, the word 'dalit' itself became popular in UP only in last few years when Kanshi Ram and Mayawati started making public attacks on Mahatma Gandhi for popularising the word 'Harijan' for the scheduled castes. 'Dalit politics' became the crucial deciding factor after the dalits refused to remain tagged on to the national parties like the Congress as mere junior partners, where they were required more for swelling their electoral support, than for any genuine political coalition. It may be interesting to look at the rising prospects of the BSP in UP. Almost from scratch, it built up its support and has become a major player in state politics. In short, while the BJP cut into the upper caste base of the Congress, the BSP weaned away the scheduled caste voters from the 'dominant party' of yesteryears. It is only the SP/JD support among the upper backwards like the yadavs, and the koeris and even some kurmis that has largely remained intact, even though this combination of parties has taken different political names varying from Bhartiya Kranti Dal (BKD) to Dalit Mazdoor Kisan Party (DMKP), Bharatiya Lok Dal (BLD), Lok Dal (LD), Janata Dal (JD), Bharatiya Kisan Kamgar Party (BKPP) and even Samajwadi Party (SP). This later incarnation of the BKD absorbed the left-over socialists in UP politics to extend its base to some of the lower backward sections of the population in east and central UP.

It is however important to mention here that the backward castes themselves do not constitute a meaningful category, even for the purposes of electoral analyses. The dominant upper backwards, the depressed backwards and the dalits are the three different backward caste groups in UP that make the winning combination for any party. The SP-BSP alliance for the 1993 assembly elections actually pursued this caste combination as the old AJGAR

formula devised by the late jat leader Charan Singh had obviously failed to muster enough electoral support from among these groups. Thus it could not take various incarnations of the JD (BKD/BLD/LD/JD/DMKP) anywhere beyond a coalition with some of the parties of the upper castes. The division of the backwards into three parties, mentioned earlier, ensured that they remained political appendages whereas the major constituents of the coalition always had a more decisive say in politics. While the JD concentrated on the upper OBCs, some Lohiaites made a dent in the lowest OBC votes, even though not very successfully. The socialist parties and the BKD (or JD) in UP made an attempt to combine the strength of the two groups by welding the political and economic power of one with the numerical strength of the other, but in view of the schism between the two, they fell short of a winning formula. The caste statistics in UP reveal that the jats, the yadavs, the kurmis, the koeris, the lodhas, etc, together constitute only about 15 per cent of the total population. As against this the depressed backwards (i.e., the lower OBCs) constitute about 25-30 per cent, nearly double the population of the less backward castes. This is very crucial for any electoral game. However, the yadav leadership of the OBCs has largely failed to sufficiently mobilise this group of castes, maybe due to the backward-backward rivalries between the two. The SP-BSP alliance of 1993 actually was an attempt to weld these groups, along with the Muslims and dalits, together into a winning combination, which however could not succeed.

The social and political upheaval that has characterised electoral politics in UP in the last few elections, has hardly had any direct impact on Uttarakhand. The results of last few general elections indicate the fast declining fortunes of the Congress Party as against a sharp rise in BJP, SP and BSP support in the state (Table 1). Contrary to these general trends in Uttar Pradesh, one finds a somewhat different political scenario in Uttarakhand (Table 2).

Uttarakhand had the distinction in 1991, of being the only region in UP to give a very high percentage (40.3 per cent) of votes to the BJP, which made a clean sweep of all the four parliamentary seats. In comparison, Bundelkhand, another such region where the party won all the four seats, however, gave the BJP only 31.9 per cent votes. In fact, the BJP's score, in terms of valid votes polled in Uttarakhand was the highest when compared with that of any other political party in any region of the state. Yet, it was in this region that the BJP suffered the most and could manage to win only half the seats in the parliamentary elections held in May 1996, securing only 30.2 per cent votes. The only other parties to have suffered such an electoral damage were the Congress and the Janata Dal, but then their loss should be analysed in view of the divisions and splits, in their ranks. If Congress (T)'s and Samajwadi Party's votes are clubbed with their parent parties' votes, the tally comes to 44 per cent and 8.2 per cent respectively. Thus the Congress is in fact a net gainer and the Janata Dal's loss is that of around 4 per cent votes. It is only the BJP which lost approximately 10 per cent votes without having faced any split in the party that could have affected its base in the region, and despite having slightly gained in its overall tally in the state. The only other region in the state where the BJP lost considerably in the last five years was Rohilkhand, where its seats went down from seven to two (out of a total of 10), and the vote share accordingly declined to just 29.1 per cent, from a high of 37.5 per cent in 1991. In all other regions, the BJP actually gained in terms of votes, barring Poorvanchal where its vote share declined by only half a percentage point.

The electoral profile of Uttarakhand can be better understood by looking at the social and cultural composition of the area. The region, being largely mountainous, has remained somewhat cut-off historically from the plains. Most rulers of the plains, right since the days of the Mughals,

who tried to extend their control over the Garhwal and Kumaon hills, could do so only symbolically. The local chieftains, who at times accepted the suzerainty of the 'emperor' from the plains, enjoyed considerable freedom at the regional level, his 'acceptance' being only formal and confined to contributions to the treasury, etc. 'Muslim rule' in the plains affected the hills in a different manner. Many residents of the plains who felt suffocated under the 'alien' rule for some reason or the other, migrated to the hills which were generally considered to be inaccessible. This helped them preserve their culture and religious rites. Many hill dwellers are thus descendants of those who migrated to the hills hundreds of years ago. Most of these were either from the priestly classes or were associated with some of the 'kshatriya-rajputs'. Even though the claims of many of these upper castes today may be doubtful in terms of their sociological status, the process of sanskritisation seems to have helped them move upward, over the years. This may account for the negligible percentage of 'backwards' and Muslims in the population of Uttarakhand. It is this peculiar population composition of the region that sets it apart from the UP plains where 'backwardisation of politics' has changed the political climate of the state almost completely. Thus a rising party of the dalits which is fast cutting into the dalit base of the Congress Party, the Samajwadi Party of Mulayam Singh Yadav which seems to have cornered the Muslim votes, once the monopoly of the Congress Party, and the Janata Dal, the legatees of Chaudhary Charan Singh's Bharatiya Kranti Dal and Bharatiya Lok Dal, are just not electorally relevant to the region. It is only in the 'terai' belt of the Nainital district, now renamed Udham Singh Nagar, that the 'backward' caste votes have sizeable strength. This perhaps accounts for the relatively better performance of the SP/BSP in this district.

III Electoral Politics since 1996

UP went to the polls twice in 1996, first in May for the Lok Sabha and then in September-October for the vidhan sabha. The instability resulting from no party gaining a clear majority has forced mid-term elections on the state. The term of the vidhan sabha has in practice reduced to a period of about two years. Thus, after 1991, vidhan sabha polls were held in 1993 and then recently in 1996. While in 1991, the BJP formed the government at Lucknow, in 1993, it was the SP-BSP combine that eventually succeeded in

forming its government under the chief ministership of SP supremo Mulayam Singh Yadav. However, soon this arrangement gave way to the BSP-led and BJP supported Mayawati government, which like its predecessor could not last long, as soon after its formation, the BJP withdrew support which it had lent 'from outside'.

A cursory comparison of the five elections held in last 5-6 years, i.e. Lok Sabha polls 1991, and 1996, and vidhan sabha polls 1991, 1993 and 1996, indicates some very interesting developments in UP. While the fortunes of the main political players have remained almost unchanged overall, the Uttarakhand region has experienced severe upheavals in terms of the performance of the main political actor of the region, the BJP. It is interesting to note that the main political players in the Lok Sabha elections in 1991 and 1996, the BJP, the JD and the Congress, secured 51, 53, 22 and 17 (including SP), five and five seats respectively. Similarly, in the assembly elections held in 1993 and 1996, the main political actors in UP won nearly the same number of seats. The tally was BJP 176 and 177, the SP-BSP 177 and 176 (clubbing the two even though there was no seat adjustment in 1996), the Congress 28 and 33, and the JD 26 and 15 (including the breakaway Bharatiya Kisan Kamgar Party), seats respectively. It seems the various political combinations have exhausted the limits of mobilisation of their respective social support structure. As pointed out by a number of studies on UP, these political formations have, quite neatly, carved out caste-based electoral support. Thus, while the SP gets its major support from the upwardly mobile backward castes (such as the yadavs) and the Muslims, the BJP depends largely on the upper castes and some of the Sanskritised castes from among the backwards (kurmis, and lodhs in particular). Similarly, the BSP has concentrated on the dalit vote – the scheduled caste votes in general and the chainar votes in particular – and the Congress has retained some support among the upper castes even though it has generally lost a majority of them to the BJP. Any further mobilisation on caste basis alone is perhaps unlikely to result in any major change in the electoral fortunes of any of these political formations. This partially explains the phenomenon of a hung assembly for the third time in a row.

It is in this respect that the politics of the Uttarakhand region differs somewhat from that of the rest of the state. As mentioned earlier, the 'backwards' are a negligible group in the hills (except in the terai region) and it is the upper castes,

namely, the brahmins and the rajputs (thakurs) who constitute the support base of the main political parties like the BJP, the Congress and the Congress (T). The SP-BSP support is practically confined to the Chakarata region in Dehradun district and the terai region in the Udham Singh Nagar district. These two subregions of Uttarakhand are somewhat different from the rest of the hills in terms of the composition of the electorate. Most of the tribals and the scheduled castes are concentrated in these regions, apart from the migrants from West Punjab who came as refugees in the wake of the partition in 1947 and have now become owners of large agricultural farms. Thus, all the major political parties of Uttarakhand are cutting into the same caste clientele. This perhaps accounts for the major upheavals in the fortunes of these parties in the Lok Sabha and the vidhan sabha polls. The brahmin-thakur rivalry often makes or mars the fortunes of individual candidates. Interestingly however the kind of excessive caste-based polarisation that has characterised the 'manthan' of UP politics for a decade now is by and large missing in Uttarakhand hills. Even the dominant issues that determine the outcome in the UP plains are different from those that decide the fate of Uttarakhand politics. While issues like the construction of Ram temple at Ayodhya and politics of hindutva may be important in the hills as well, these recede into the background in the context of more important ones like the creation of the Uttarakhand state. Since most political parties which matter in the region's politics are already committed to the creation of a separate hill state, the real issue has become the 'sincerity' or 'lack of sincerity' in making efforts in that direction. Except the CPM, which is quite hostile on this issue, most other parties

TABLE 3: ASSEMBLY ELECTION 1996:

have generally tended to support the statehood demand. The SP and BSP, even though not very favourably inclined to this demand, have nevertheless sided with it by passing a resolution in its favour during their reign in Lucknow. The BJP had already done so during Kalyan Singh's chief ministership earlier. Even the CPI has always supported the creation of a hill state. The Congress prefers a 'regional council' type arrangement or a union territory status for the region. Thus it is only the CPM which does not favour the creation of Uttarakhand, but then it has practically no support base in the region.

It is this 'consensus' in favour of the demand for a hill state that has somewhat changed the political scenario in the Garhwal-Kumaon hills. While all parties favour the demand, none has finally succeeded in appropriating it fully. Even the only regional party of the hills that owes its very name and origin to the demand for Uttarakhand, the UKD, has failed miserably in consolidating the gains of its efforts to mobilise the masses on this issue in last three to four years. It is in this context that the Lok Sabha and the vidhan sabha polls in 1996, and the Lok Sabha poll in 1998, need to be analysed in order to understand the swiftly changing fortunes of some of these parties.

Ever since the demand for Uttarakhand 'massified', the UKD, the only regional party in the UP hills, has spearheaded the agitation. The UKD which was founded in the late 1970s had raised the demand several times in the past as well, but it remained a marginal force in the absence of a mass-base of the movement. The demand in fact remained confined to intellectual circles and consequently, at the polls it could hardly generate any sentiments in favour of the pro-Uttarakhand candidates. It was precisely this that enabled the national parties in the past to keep their electoral bases intact in the region. The Lok Sabha elections held in 1996 were the first when the issue was brought on to the agenda. Earlier, in the 1991 Lok Sabha elections, the BJP had swept the polls, winning all the four seats from the region. Even though the 'Ram-wave' was largely responsible for this, the BJP's attempt to appropriate the Uttarakhand slogan ('Uttaranchal' as it calls it), was also partly responsible for the handsome margins with which the BJP candidates won the seats. However apart from passing a resolution in the UP state assembly during chief minister Kalyan Singh's regime (which was subsequently repeated even by the 'villain' of hill politics, Mulayam Singh Yadav's government in

UP), the BJP did nothing at the centre to create the hill state. Its sizeable strength at the centre between 1991-1996 had made the hill dwellers hopeful of some pressure being built up on the centre in this matter. This was the background to the declaration of Lok Sabha elections in March 1996. There was enough resentment among the people to boycott the polls to protest against the lackadaisical attitude of the centre. Since the UKD boycotted the elections, the people were left with very little choice except to vote for the national party candidates. Thus half the seats were won by the Congress (T) and the BJP each. Table 2 shows the declining fortunes of the BJP compared to its score in 1991.

The results of the Lok Sabha polls were along expected lines because there was no other serious contender in the region thanks to the boycott call. The Congress had long been out of the race in the region, as in the rest of the state. The SP and the BSP had earned the wrath of the hill dwellers during the agitation in 1994, resulting from the Muzaffarnagar incident of firing and rape. The Mussorie and Khatima firing incidents also generated hatred against the SP-BSP government.

Thus, except in Nainital, the SP-BSP remained at the fourth position. Only the Congress (T) posed a serious challenge to the BJP in the region, from whom it snatched two seats, Garhwal and Nainital. Both the winners, Narayan Dutt Tiwari and Satpalji Maharaj, were very popular candidates. Tiwari was not only the party's national president but was hailed as a 'parvat putra' (son of the hills) and 'vikasputra' (harbinger of development) in the Kumaon region. His defeat in the previous Lok Sabha polls was deeply regretted by his electorate in Nainital who insisted on 'correcting' this 'mistake' in the 1996 elections. Most buildings in the Kumaon hills are associated with his efforts to generate a climate for economic development in the hills during his two tenures as UP's chief minister.

The BJP retained Tehri and Almora seats from where its candidates Manbendra Shah, the ex-maharaja of Tehri, and Bachchi Singh Rawat, won by margins of 35,000 and 57,000 votes, respectively. Shah's margin was reduced by nearly 11,000 votes from that in the 1991 elections.

Throughout the UP hills the boycott call seemed to be evoking good response on the eve of the Lok Sabha poll (1996), but the euphoria generated among the Uttarakhand activists soon disappeared when, on polling day, a reasonably large number of voters (35-40 per cent) turned out to vote. This proved all those wrong

who had claimed that the hills had been totally alienated from the political parties who were not putting enough pressure on the centre to force it to accede to their demand. Two things accounted for this. The caste factor in some towns, where rajput-brahmin rivalries induced voters of their respective communities to vote for their candidates, leading to 'counter turn-out'. The second factor was the logic of the 'first past the post' system where a candidate securing maximum votes would get elected, even if only a handful of voters finally turned out to vote. This made the whole idea of boycott look ridiculous, and the candidates could persuade the voters to turn up on the polling day.

IV

Recent Shifts and Future Prospects

It was only in May 1996 that the BJP had a setback in Uttarakhand when two out of the four Lok Sabha seats in the region were snatched from it. The two notable winners from the Congress (T), as mentioned earlier, were party president N D Tiwari himself, and Satpal Maharaj who subsequently became minister of state for railways. This was despite the fact that the BJP was the first party to have passed a resolution in the vidhan sabha for a separate state of 'Uttarakhand' during its reign in Lucknow. The anger of the people was then largely directed against the BJP's attempts to 'sabotage' the boycott call given by the Uttarakhand Samyukta Sangharsha Samiti (UKSSS), the joint action committee.

Most voters then believed that the political ambition of a party like the BJP was too compelling a factor to allow it to join an apparently 'non-political' movement like the one being launched for Uttarakhand state. The verdict in the vidhan sabha poll (October 1996), however, gave a nearly clean sweep to the BJP - 17 out of 19 seats in the region. The Kashipur seat in Terai and Chakrata in Jaunsar Bawar area were the only ones it lost. The party repeated this performance in the recently held 1998 Lok Sabha poll. This despite the absence of a 'Ram lila' this time, and despite the United Front (UF) prime minister having announced from the ramparts of the Red Fort, the decision of his government to create a separate state of Uttarakhand. Deve Gowda had perhaps expected a change after this announcement in favour of the Congress (T), a constituent party of the UF. It seems that the entire thing boomeranged and even the support that had existed before for the party disappeared altogether. This per-

haps explains the defeat of N D Tiwari who until recently headed the Congress (T) before contesting the 1998 Lok Sabha election on Congress (I) ticket.

Besides the Congress (T) being the only constituent party of the UF having a base in the region, the UKD had also set its eyes on at least a sizeable chunk of seats, consequent to the agitation for a separate state it has spearheaded for over a decade now. It may be recalled that, unlike the BJP and the Congress (T), the UKD had not participated in the Lok Sabha poll held in May this year, in view of the boycott call given by the UKSSS.

The BJP sweep might appear somewhat startling to the people outside the region. But the Congress (T) and the Congress both had associated themselves with the leaders and the party (Mulayam Singh Yadav and SP) whose government in October 1994 was responsible for the 'humiliation' of the Uttarakhandis. Every attempt was made to keep the enquiry report from the public to protect the guilty, which increased the feeling against the two leaders, Mulayam Singh Yadav and Mayawati, especially against the former who had headed the administration at that time. A straight answer to the question from the Uttarakhand activists about reasons for the BJP's sweep, was the absence of any 'choice' before the hill dwellers.

Apart from these political parties, the only available alternative besides the BJP, was the regional party, the UKD. The latter, has been deeply divided itself. Besides having a fragmented leadership, it has suffered heavily on account of a lack of any serious effort to build the organisation from below. Most activists believe that the UKD has the 'largest number of leaders' – a sarcastic reference to the lack of organised and cohesive leadership. While it had successfully mobilised the people two years ago in favour of the demand for a separate state, it failed to translate this mobilisation into electoral gains. Consequently, in state assembly polls it saw humiliating defeats Table 3. First it gave a call for the boycott of Lok Sabha elections and then, for no apparent reason, fell in line at the time of the vidhan sabha poll. Many activists whom I met at Uttarkashi, Karna Prayag, Rudra Prayag, Gopeshwar, Joshimath and Dugadda, maintained that it was ridiculous on the part of the UKD to have boycotted the Lok Sabha poll. It would have been more sensible to dissociate itself from the vidhan sabha poll, as in any case the people were asking for severing their links not from Delhi but from Lucknow.

As a matter of fact, the UKD was not even responsible for the massive mobilisation for the separate state that took place in August 1994. It was essentially a spontaneous movement spearheaded by the students and their guardians (largely mothers) against the extension of the 27 per cent OBC reservations to the hill areas (where the 'backwards' constitute a mere 2-3 per cent of the population), and the statehood demand was only subsequently added by the UKD. It seems that the UKD wasted a good opportunity to ride the popular wave, largely due to its inability to rise above petty leadership interests and lack of grass roots workers capable of withstanding the temptation of seeing their names in the regional press every morning.

The BJP repeated its performance of 1991 in the 1998 Lok Sabha poll when it bagged all the four seats from the region defeating, among others, the popular leader N D Tiwari from the Nainital constituency.

The declaration from the Red Fort by the then prime minister, in favour of a separate state of Uttarakhand on indepen-

dence day 1996, and now the BJP-dominated central government's decision to form the state of Uttarakhand, have mollified the people in the region for the time being. However, the real challenge to the regional leadership is yet to come. While it is one thing for the regional elite to mobilise the masses and raise their expectations, it is quite another to channelise these aspirations so as to meet the rising expectations of the masses. Massification has its own limitations. Once a movement draws sustenance from the rank and file and enlarges its scope of influence, it tends to create its own momentum which cannot always be controlled by the leaders who first initiated the mobilisation. It is therefore very important for this leadership to raise its own stature and rise above petty jealousies and rivalries to cope with the political ambitions of the electorate. Only a politically wise and selfless leadership would be able to translate the tremendous enthusiasm that it was able to generate, into constructive efforts to build a new state of Uttarakhand.

Local Configurations and National Parties in Himachal Pradesh

T R Sharma

The state of Himachal Pradesh is geographically divided into, one, tribal 'upper' areas which have an extensive horticultural belt producing for the market, and two, non-tribal 'lower' areas which have subsistence agriculture. The upper areas have not entirely shed the feudalism of the erstwhile princely states, while the lower areas nurse a grievance of being neglected. The state has a two-party system, Congress favoured by the upper areas and the BJP supported by the lower areas. The state has a history of electing to the assembly the party which rules at the centre as it is dependent on central financial assistance.

I Introduction

JUXTAPOSITION of statistics of 1998 Lok Sabha elections in Himachal Pradesh with the electoral data of the state relating to 1991 and 1996 elections reveals some very interesting features. The Congress party's vote share which had risen from 46.2 per cent in 1991 to 54.3 per cent in 1996 fell to 41.5 per cent in 1998. It is interesting to note that the 1996 upswing for the Congress Party came in the hill state at a time when its electoral fortunes sharply declined in the rest of the country and its tally of seats fell from 232 to a dismal 140 – an all-time low. Further, the 1998 dismal showing of the party in the state came at a time when it improved its vote share and tally of seats in the country as a whole. The party also suffered badly in the 1998 vidhan Sabha elections which were held simultaneously with the Lok Sabha polls. Here, the party's tally of seats which was 52 in the dissolved house dropped to 31. Its vote share dropped from 49.3 in the 1993 assembly poll to 43.3 per cent. The BJP's track record is no less interesting. While it had won two of the four Lok Sabha seats in the state in 1991, it drew a blank in 1996. Its vote share fell from 42.8 per cent in 1991 to 39.6 per cent in 1996. The 1998 election halted this downslide of the BJP. Even though its vote share did not show any notable increase over 1996, it was able to capture three of the four Lok Sabha seats. The total rout of the BJP in 1996 and its spectacular come back in 1998 in terms of seats won, despite the fact that there was hardly any swing in its favour, is completely at variance with the general electoral pattern witnessed in the rest of the country. A close look at the electoral data of 1996 and 1998 also reveals that in many ways these two elections mark a clear departure from the earlier electoral trend where the popular verdict in the state, right since 1972, has

been very much in line with the pattern exhibited by the other state of the region, particularly by those of the Hindi heartland. It is necessary to explain the 1996 and 1998 variance by identifying the objective and subjective factors that account for it.

Before we do so, let us look briefly at some of the main determinants of electoral politics in the state: physiography, demography, history, socio-economic and politics. In physiographic terms most of Himachal Pradesh is mountainous and semi-mountainous, and bears close resemblance to the 'seven sisters' of north-east India;¹ only a small part of it is akin to the plains of Punjab. In common parlance the former is usually referred to as 'the upper area'; while the latter has come to be known as 'the lower area'. In demographic terms, 60 per cent of the state constitutes the 'non-tribal belt' and accounts for 96 per cent of its population; while the remaining 40 per cent area constitutes the 'tribal belt' and sustains only four per cent of the state's population. There is some overlap in the two categories (physiographic and demographic), and the upper areas do have some non-tribal population as well, although the converse is not true in that 'tribal belt' does not extend to the lower areas. As we shall argue later, the physiographic and the demographic factors have come to exercise considerable influence on the politics of the state particularly on its electoral politics.

In addition to these physiographic and demographic factors, the politics of Himachal Pradesh is strongly influenced, almost determined, by the socio-economic factors and historical antecedents to which a brief reference seems appropriate.

At the time of its birth on April 15, 1948 as a part 'C' state of the Indian Union, Himachal Pradesh consisted of about 30 Shimla Hills princely states. The political structure of these princely states was totally undemocratic, the society was highly feudal and the economy was extremely primitive,

almost tribal. People lived in abject poverty and servility seared their psyche. Centuries of oppression had rendered them too weak and too passive to aspire to break their chains. They had very little interaction with the outside world except through soldiers supplied for the defence of British rule during and between the two world wars. It was only towards the late 1930s and early 1940s that the Praja Mandal movement for the liberation of these states from the feudal princely order began to gain ground. However, the movement was limited to only a microscopic minority of political activists. The movement never acquired a mass character. It was after the integration of princely states into Himachal Pradesh and the holding of the first general elections in 1952, that the people of Shimla Hills got the first representative government.

II Profile of Himachal Pradesh

The state's journey on the democratic road, which began in 1952, was not smooth. The democratic process got a setback when the status of Himachal Pradesh was downgraded to that of a union territory without a legislative assembly, in the wake of the 1956 reorganisation of states. In fact the very survival of Himachal as a separate political unit was threatened. It was in 1963 that the legislature was restored. Three years later, in November 1966, the hilly areas of Punjab – Kangra, Kullu, Lahaul-Spiti, etc – were transferred to Himachal, at the time of the linguistic reorganisation of Punjab. The population and territory of the state nearly doubled with this transfer which ultimately paved the way for elevating the status of Himachal Pradesh once more from a union territory to a state in 1971.

It needs to be noted that the 'new areas' which were added in 1966 were quite different from the 'old areas', not only politically but also economically. They

had been part of Punjab province since its annexation in the British Empire during the mid-19th century. Consequently, they had had limited but continuous experience of democratic institutions during the British rule and more so after 1947. The level of political consciousness of the people of the 'new areas' was much higher than that of the 'old areas'. The freedom movement had had wide popular support in Punjab right since the days of the non-cooperation movement of 1920. Several leaders of the 'new areas' had played a very important role in the freedom movement under the auspices of the Indian National Congress and had rubbed shoulders with prominent leaders like Nehru and Gandhi. The transfer of 'new areas' brought together two sets of people who were not without prejudices about each other. Moreover, although the two could be said to be culturally somewhat similar, their political culture was quite dissimilar. These prejudices and the dissimilarity in political culture were often reflected in the politics of the state.

The transfer of 'new areas' has another dimension which has all along affected the state's politics. The transfer of 'new areas' has another dimension which has all along affected the state's politics. Before their merger with Himachal these areas were on the 'periphery' of Punjab not only in a physical sense but also in politico-economic sense. After their merger they came to the centre stage – at least so the leadership of these areas thought. However, it soon realised that enough political space was not readily available to it in the new set-up. Consequently, some tension developed between the political leadership of the two areas. The two developed divergent perceptions and competing political aspirations. While the leadership of 'new areas' usually boasted of its stellar role in freedom movement to justify its present clamour for a dominant role in the politics of the state, the leadership of the 'old areas' took advantage of its entrenched position in the state's power structure to keep the former at bay. To some extent, there developed a feeling of relative deprivation in the 'new areas'. It will hardly be an exaggeration to say that even today, 30 years after the merger of new areas, the politics of the state, in many important ways, is projected along the 'old-new' divide.

The economic factor has further accentuated this 'old-new' cleavage. Himachal Pradesh consists of two distinct agro-climatic zones: the horticultural and the agricultural. The two have hardly anything in common. While the 'new areas' are predominantly agricultural; the 'old

areas' have an extensive horticultural belt. For reasons of terrain and topography the agricultural zone is fit only for subsistence farming, while production in the horticultural zone is mainly for the market. The former is hardly able to generate any surplus, while the latter does so in considerable measure. Moreover, agriculture still continues to be labour intensive, while horticulture is increasingly becoming capital intensive. Infrastructural needs of the two economies are quite different. The two have different priorities and usually compete for state patronage, and resources. Over time, the two economies have created sharp economic differentials between the two regions – the horticultural region has moved ahead, while the agricultural region has lagged behind. This gulf continues to widen because agriculture is not half as remunerative as horticulture. The diverse historical antecedents of 'old' and 'new' and the economic cleavage of horticultural and agricultural zones reinforce each other rather than cut across each other.

Himachal Pradesh is predominantly a rural state. Hence there is no rural-urban cleavage. Similarly there is no communal cleavage because nearly 96 per cent of the state's population is Hindu. The remaining 4 per cent consists of Muslims, Sikhs, Buddhists and others. On the communal plane the situation in Himachal is so different from rest of the country that most analysts/social scientists find it difficult to fully reconcile themselves to this scenario. In addition to 'old-new', 'upper-lower' horticultural-agricultural and 'tribal-nontribal' cleavages, the other cleavage that gets reflected in politics is that on caste lines. But the character of this cleavage is quite different from caste cleavages in other states of the Hindi heartland. Table 1 shows the caste demography of Himachal Pradesh. Tables 3 and 4 show the caste and community composition of the elected representatives of the state.

Table 1 shows that the middle castes and the OBCs, who have come to play a decisive role in the politics of several other states of the country, are virtually non-existent in this hill state. Among the OBCs, it is only a small ghirath community which is concentrated around Nagrota which is of some political consequence but its overall influence in the state's politics is minimal. Among the middle-castes, it is the khatri community which has some political articulation in Kangra and Chamba. However, the total population of the OBCs and middle castes taken together would be only around 15 per cent. Nearly 30 per cent of the population consists of scheduled

castes and scheduled tribes. While the former are evenly scattered all over the state; the latter are concentrated in three identifiable belts. The majority of the state's population consists of the two upper castes: the rajputs and the brahmins. In fact, the rajputs constitute the most dominant caste, numerically as well as otherwise. Of course, within each upper caste there is a hierarchy of sub-castes. The sort of de-Sanskritisation that has overtaken the other states has not touched Himachal Pradesh in any significant manner, at least not yet. The only notable demand which has been articulated by now and then is by the gaddies of new areas and the gujjars to get a scheduled tribe status. In sum, the struggle for power on caste lines is not there in the same intensity as in some other states. Whatever little of it is there, exists only between the two upper-castes. Here it needs to be remembered that in the 'old areas' the rajputs have a definite advantage in this race because, historically, they have been in the ruling position in the princely order. The other caste-group is in an advantageous position, in relative terms, is that of the khatris, whose economic clout has helped them to gain a foothold in the politics of the state.²

III Two-Party System

It is these socio-economic factors coupled with the historical antecedents that have all along shaped politics in the state, particularly its electoral politics. The

TABLE 1: DEMOGRAPHIC COMPOSITION IN HIMACHAL PRADESH CASTE*/COMMUNITY (DESCENDING ORDER BY SIZE)

Name	Per Cent Share
Upper Caste	56.0
Rajputs	28.0

Sikhs	1.0
Buddhists and others	1.3

Note: * Authentic figures about population of various castes are not available. Therefore the above figures should be treated only as approximate. They have been compiled from different sources, formal and informal.

most significant impact of these factors has been the emergence of a clear-cut two-party system. The contest for power is only between the Indian National Congress and the Bharatiya Janata Party. Although both of them are all-India parties, they have developed some sort of a localised character. Willy-nilly each comes to be identified with an economic zone. The support structures of the two are also demarcated in such a way that one is strong in the old areas; while the other has its stronghold in the new areas. So much so that each has also acquired a caste identity. In short, the electoral politics in the state revolves around the Congress and the BJP. There is no regional party and third parties like the CPI, CPM, JD, SP, BSP have only a very nominal existence. It is only recently that a regional outfit founded by Sukh Ram, former union communication minister, named Himachal Vikas Congress has acquired a strategic position in the politics of the state. In a situation where the Congress and the BJP are evenly balanced the HVC is capable of tilting the scales in favour of the one with whom it chooses to align itself on terms dictated by it. Given the fact that Sukh Ram has been, for three decades a powerful leader of the Congress in the state he is more likely to erode the electoral base of his parent party than that of the BJP. Further, given the fact that Sukh Ram was unceremoniously thrown out of Congress in the wake of the telecom scam, the chances of his joining hands with it are not as bright as that of his aligning with the BJP. However, it is too early to say whether such a personalised political party would become a permanent feature in the politics of the state. The chances are that it will gradually disappear and the two-party system will continue.

The evolution of the two-party system in the state can be traced to the fourth general elections held in 1967. Till then, Himachal, like other states of the country, had only the Congress Party. The Congress Party's vote share during the first three general elections to the Lok Sabha ranged between 47.3 and 68.7 per cent which enabled it to capture all the seats. In the vidhan sabha/territorial council elections, the party was able to win a clear majority and its vote share ranged between 47.3 and 63.8 per cent. On the other hand, the Jan Sangh failed to win a single seat in any of the three elections and its vote share ranged between 2.2 and 5.6 per cent. In the vidhan sabha/territorial council elections, next to Congress the second largest chunk of seats and votes was captured by independents. Even the Kisan

Mazdoor Praja Party (KMPP), Swatantra, All-India Schedule Caste Federation (SCF), Praja Socialist Party (PSP) and communists registered their victory but the Jan Sangh's performance could not match them. The 1967 general elections mark a watershed in the electoral history of the state. The Jan Sangh, for the first time, made an impressive showing. Even though it did not win any seat to the Lok Sabha it polled 19.1 per cent vote which was higher than the percentage of votes polled by any other political party except Congress. In the vidhan sabha elections, its performance was even better. With merely 13.9 per cent vote, the party was able to capture seven seats in a house of 68. Incidentally, this was the first election after the merger of new areas and five of the seven seats won by the party were from these areas. These are Shimla, Bhota, Mewa, Hamirpur and Sulah.

After 1967 the Jan Sangh further consolidated its position and the two-party system struck roots. One significant development in the electoral history of the state has been that, after 1967, there have been no simultaneous elections to the Lok Sabha and the vidhan sabha. All vidhan sabha elections have been held after the parliamentary elections. Consequently, the outcome of the latter have decisively influenced the outcome in the vidhan sabha elections. This is so because in a small and poor state like Himachal Pradesh, which has to heavily lean on central assistance, the normal tendency of the electorate is to put that party in power in the state which is ruling at the centre. The assumption is that this would ensure smooth flow of funds to the state. There appears to be sufficient justification for this assumption. Be that as it may, the fact remains that electoral verdict in all the vidhan sabha elections, after 1967, has replicated the electoral verdict of the Lok Sabha elections.

At the time of the 1971 Lok Sabha elections the popularity of Congress was very high, partly because of some radical measures initiated by Indira Gandhi and her slogan of 'Garibi Hatao'. In Himachal Pradesh there was a strong pro-Congress wave because in January 1971 it was accorded statehood. Consequently, the Congress polled an unprecedented 75.8 per cent vote. But even in the midst of this wave, the Jan Sangh was able to poll 10.6 per cent vote. The popularity graph of the Congress further improved because of India's role in the liberation of Bangladesh in late 1971. Consequently in the 1972 vidhan sabha poll, the Jan Sangh's vote share declined to 7.7 per cent but it was

able to win five seats in the assembly, including three which it had won in 1967 in the new areas. One can say that, by 1972, some assembly segments had clearly become strongholds of the Jan Sangh. However, the party was yet in no position to displace the Congress from its ruling position.

It was in 1977 that several non-Congress political parties came together to form the Janata Party. It swept the Lok Sabha poll in all the states of north India and the Congress Party drew a blank. In Himachal, the Congress vote fell to 38.6 per cent, the lowest ever. In the vidhan sabha elections, held a few months later, the Congress was completely routed. It could win only nine seats in a house of 68. The Janata Party secured a massive majority, winning 53 seats. The character of Janata Party in Himachal Pradesh was such that its major constituent was the Jan Sangh. Other constituents like Congress(O) and Congress for Democracy were only minor partners. Consequently, after the assembly poll, Shanta Kumar of Jan Sangh became the chief minister. However, his election as leader of the Janata legislative party was not without a contest. In fact, a lot of bitterness was created between Jan Sangh and non-Jan Sangh components of the party because of this contest. Caste and regional feelings were whipped up. Thereafter, the Janata Party in the state remained highly faction-ridden all along and the chief minister was repeatedly forced to seek a vote of confidence.

Two years of Janata rule were politically quite eventful. The Jan Sangh used this period to consolidate its support-base at the cost of other constituents of the alliance. One way chosen was to project itself as the dispenser of justice to the new areas, which stood discriminated against, at the hands of Congress governments. Secondly, this was done by inducting all the heavyweights of the Jan Sangh group in the council of ministers and by assigning them important portfolios. On the other hand, only lightweights of non-Jan Sangh components found berths in the ministry and they were given only the less significant departments.

When the Janata Party finally split under the weight of internal dissensions, the BJP was able to walk away with most of the organisational network. However, it could retain only 23 of the 53 party legislators and was reduced to a minority in the assembly. Despite its broadened support base, it was unable to retain any of the four Lok Sabha seats during the 1980 parliamentary elections even though it polled 36.4 per cent vote which was quite

impressive. With the Congress having polled 52.1 per cent vote, the two main political parties accounted for 88.5 per cent of the votes polled. The rump Janata Party's performance was very poor and its vote share was only 5.3 per cent in the parliamentary elections. In other words, the BJP was able to win over most of the Janata Party's electoral base. However, the failure of the BJP to win any Lok Sabha seat in the parliamentary elections from the state, coupled with the return of Indira Gandhi to power at the centre had its fallout and the Shanta Kumar government had to howl out. Soon the Congress was able to form its government. Although in 1977 it had won only nine seats in a house of 68, it managed to secure a majority by admitting large number of Janata Party legislators. The Congress continued to rule the state for about two years through this make-shift arrangement.

In the 1982 vidhan sabha elections, both the parties made a serious bid for power. However, the electoral verdict was unclear. It was a hung assembly. Both the parties were almost evenly balanced. While the Congress bagged 31 seats, the BJP got 29. The vote share of the Congress was 42.5 per cent, while that of the BJP was 35.2 per cent. The Janata Party was virtually wiped out and could win only two seats. Its vote was a miserable 4.2 per cent. It is interesting to note that 20 out of the BJP's 29 seats came from the new areas, while only nine came from the old areas. On the other hand, out of 31 seats won by the Congress only 10 were from the new areas.³ The remaining 21 came from the old areas. The 1982 vidhan sabha clearly established the fact that the BJP had been able to sell the argument that the new areas were getting a step-motherly treatment from the Congress government and only the BJP could protect the legitimate interests of this region.

The 1984 Lok Sabha and 1985 vidhan sabha elections were held following the assassination of Indira Gandhi, which caused a strong sympathy wave in favour of Congress. Consequently, in the parliamentary poll, the Congress Party's vote in the state swelled to 67.6 per cent, while that of the BJP fell to 23.3 per cent. Interestingly, in the vidhan sabha elections, which came close on the heels of Lok Sabha poll, the BJP recovered some of the lost ground and its vote share rose to 30.6 per cent, while that of the Congress fell to 55.4 per cent. However, it was enough to ensure massive majority for the Congress. The BJP could win only seven seats, while Congress won 58—an all-time high. The break-up of these 58 seats reveals

that the party retained 30 of the 31 seats that it had won in 1982. It lost only one, Thural. It snatched 22 constituencies where the BJP had won in 1982. Its remaining six victories were in constituencies where the Janata Party and independents had won in the earlier elections. Thus, the Congress fully recovered the ground that it had lost in 1977 and 1982 to the Janata Party and the BJP.

In terms of its support structure, the 1996 Lok Sabha poll shows that the BJP had little support among the youth. Its main electoral support came from 46-55 age group voters (Table 2). It also has a very weak base among women voters. The party seems to have improved its position among both these segments in 1998.

Similarly, among the scheduled castes and scheduled tribes, the BJP's influence marginal in 1996. But it improved its position in 1998 among these segments, particularly among the tribals. Its major support comes from the two upper caste groups, namely, the brahmins and the rajputs. The poor and the very poor are still within the Congress fold, while the BJP has considerable support in the middle class and the highly educated strata of the electorate. However, numerically this strata is very small. The illiterate and less educated voters are largely with the Congress. In terms of the regional spread of Congress and BJP's electoral support, one finds a paradox. The Congress which is a centrist party is strong in the old areas which had been under princely feudal rule before 1947. On the other hand, the BJP which is a rightist political outfit, is strong in those areas which were part of Punjab before 1966 and have had considerable experience of electoral politics.

IV

Recent Electoral Experiences

On the eve of the 1989 Lok Sabha elections in the country, the Congress was engulfed in intense intra-party factionalism. The Janata Dal as a national party was making waves. Credibility of the Congress leadership had been seriously eroded because of alleged kick-backs in the Bofors deal. All these factors had their fallout on the Congress party's electoral fortunes during the parliamentary poll. In Himachal, the party's performance was poor and it retained only one of the four seats. This was the Shimla reserved seat which falls in the old areas. All the remaining three seats which were general seats were won by the BJP. One of them, Mandi, falls largely in the old areas, while the other two—Kangra and Hamirpur—fall in the new areas. The Congress' loss

of the Mandi seat was primarily on account of wide-spread resentment generated due to rising prices and scarcity of sugar, for which the minister of civil supplies, Sukh Ram, who represented this constituency was blamed.

Emboldened by its impressive performance in the Lok Sabha elections; the BJP made a serious bid for power during the 1990 vidhan sabha elections. To avoid division of non-Congress vote it entered into electoral alliance with the state unit of the Janata Dal. As a part of this alliance the BJP contested only 51 (i.e., 75 per cent) seats and left the remaining 17 (i.e., 25 per cent) for the Janata Dal. This strategy paid expected dividends to the BJP which polled 41.8 per cent vote and won 46 of the 51 seats that it contested. The performance of the Janata Party was equally impressive. The party increased its vote share to 10.8 per cent and captured 11 of 17 seats contested. The Congress which had 58 seats in the dissolved house was reduced to a single digit, having won only nine seats. Thus, the party was pushed once again to its humiliating position of 1977 in the state. This was the only time after 1977 when there was some sort of electoral alliance between the BJP and the JD. In all the remaining elections, each political party contested the elections on its own.

However, having won a massive majority for itself, the BJP did not opt for a coalition government. Rather, it decided to form its own government. This decision of the BJP significantly affected the future pattern of politics in the state. The JD having won 11 seats seemed to be emerging as the third force. However, after the poll it was neither a part of the government nor a part of the opposition because it had been BJP's electoral ally. The JD remained afloat for a while but gradually most of its legislators gravitated towards and joined the Congress. Of course, this was done by the JD members more with a view to securing their political future than for any ideological reasons. They fully realised that they could exist only by aligning with one of the two principal parties of the state. However, the BJP, being a cadre-based party and sitting pretty with a massive majority in the house, was not in a mood to oblige them. On the other hand, the Congress was ready to admit them hoping that their admission would enhance the party's electoral chances, which it actually did. Thus, the Congress contributed in a big way to the development of a two-party system in the state. It did not allow the JD or the Janata Party to gain any foothold. Rather it facilitated their disintegration.

The 1991 Lok Sabha elections showed that the Congress and the BJP were almost evenly balanced. While the Congress bagged 46.2 per cent vote; the BJP got 42.8 per cent. With just 4 per cent addition to the tally of votes that it had polled in 1989, the Congress Party increased its tally of seats from one to two in 1991; while the BJP's loss of just 2.5 per cent vote cost it one of the three seats that it had won in 1989. The Congress victory was in constituencies in the old areas, while the BJP victories were in the new areas. Assembly segmentwise analysis of the two Lok Sabha constituencies, where the Congress won, reveals that the party led in 21 segments, while the BJP led in the remaining 13 segments. On the other hand, in the two Lok Sabha constituencies where the BJP won, it led in 21 segments while Congress led in 11. In the remaining two segments it was the JD candidate who led. This election revealed that in electoral terms the BJP was nearly as strong in the new areas as the Congress was in the old areas.

However, this equation radically changed during the 1993 vidhan sahha elections where the Congress polled 49.4 per cent vote and captured 52 seats. The BJP's vote declined to 36.1 per cent and its tally of seats dropped to eight. One reason for this unprecedented recovery by the Congress was the fact that the party was ruling at the centre and this fact tilted the balance in its favour in the state. But more important than this, it was due to wrong and unimaginative policies of the Shanta Kumar government that the BJP had to face the voters' wrath. Two powerful lobbies which the BJP government had annoyed during its rule were horticulturists and government employees. The BJP withdrew apple support price which the Congress governments had all along given to the growers. Instead, it came out with a market intervention scheme. This led to huge losses to the orchardists. The BJP government was also lukewarm on the issue of supply of various inputs to the fruit-growers and soft pedalled the provision of infrastructural support to them. When the orchardists agitated, there was police firing which resulted in some casualties. Thereafter, the whole fruit-growers' lobby turned against the BJP. Secondly, when the state government employees went on strike in support of their demands, the BJP government invoked the 'No Work No Pay' rule. Some employee leaders were dismissed, terminated and a large number were transferred to punishment stations. The BJP became so unpopular that Shanta

Kumar and several of his ministers had to face a humiliating defeat in 1993.

After coming to power in 1993, the Congress has followed a single point programme. It has been trying to weaken the BJP strongholds in the new areas. It has initiated several measures to squarely meet the charge of discrimination. Special attention was paid to undertake development programmes in these areas. Farmers in the new areas have been persuaded to take to cultivation of fruit and vegetables. Attempts have also been made to project Dharamsala, which falls in the new area, as the winter capital of the state. Several government departments have been asked to open their zonal office there. Two new radio stations, one at Dharamsala and the other at Hamirpur, have been commissioned. In matters of opening and upgrading educational institutions the new areas are being given preference.

The ruling party has also been trying to undo the injustice meted out to the employees by the previous BJP government. Dismissal and termination orders to some of them have been revoked. The strike period has been adjusted against leave. In the old areas the grievances of apple orchardists have been suitably removed. All these measures have pushed the BJP to the wall. There is no issue on which it may mobilise the electorate against the Congress government.

V Elections of 1998

The net outcome of these efforts of the Congress Party during three years of its rule in the state has been its 'unexpected' – though not-so-unexpected – success during the 1996 Lok Sabha poll. The party not only retained the two seats it had won in 1991 but also wrested the remaining two from the BJP. The party bagged 54.3 per cent of the votes polled; while the BJP got only 39.6 per cent. Thus the Congress victory in Lok Sabha elections in the state was both comfortable and convincing. The assembly segmentwise analysis of voting figures shows that the Congress led in 55 segments; while the BJP led only in 13. Out of these 13, as many as 10 are in the new areas and only three are in the old.⁴ A comparison of the Congress Party's performance in 1991 and 1996 Lok Sabha elections shows that there are 33 assembly segments in which the party led in both the elections. These 33 are so distributed that 11 each lie in Shimla (reserve) and Mandi parliamentary constituencies, three in Kangra and eight in Hamirpur parliamentary constituencies. The Congress also snatched two segments from the JD. In

other words, the Congress was not only able to consolidate its electoral support in the old areas but also stabilised itself in the new areas. There is only one assembly segment (Nalagarh) where Congress had led in 1991 but which it lost to the BJP in 1996.

The failure of the BJP to retain any of the two Lok Sabha seats was the result of continuous efforts of the Congress to keep the anti-people measures of the BJP government fresh in public memory. In addition, the BJP defeat was also the result of some personal factors. In the Kangra parliamentary constituency, the BJP instead of fielding its sitting MP, D D Khanoria, decided to put up the former chief minister of the party, Shanta Kumar as its candidate. For a vast section of the Kangra electorate, the candidature of Shanta Kumar, was like a red rag to a bull. The employees' leaders jumped into the fray and openly campaigned against the BJP candidate. In Himachal, government employees constitute one of most articulate sections of the electorate and their stiff opposition was enough to seal the fate of the BJP candidate.

In Hamirpur parliamentary constituency, the BJP fielded its sitting MP, Prein Kumar

TABLE 2: WHO VOTED FOR WHOM IN
HIMACHAL PRADESH, LOK SABHA, 1996

	INC	BJP	Others

Note: * Number of cases is one.

Dhumal. He had carefully nursed this constituency since 1989. He was a formidable candidate and Congress needed all its political acumen to defeat him. The character of this constituency is such that it is spread over four districts. Of the 17 assembly segments which constitute it, three segments fall in Kangra district, four in Bilaspur and five each in Hamirpur and Una districts. Dhumal belongs to Hamirpur district, and was bound to sweep the five segments of the district. To counter it, the Congress decided to put up a candidate who hailed from Una district. The calculation was that as soon as the election campaign picked up, the interdistrict rivalry was likely to come into play. If the BJP could play up district identity to garner votes for Dhumal in Hamirpur, the Congress could do the same for its candidate in Una district. This is precisely what happened. While Dhumal led in four out of the five assembly segments that fall in Hamirpur district, the Congress candidate led in all the five assembly segments of Una district. The total lead of BJP in Hamirpur district was 12,561 which was more than neutralised by the lead of Congress in Una district which was 21,598.

There was another factor which went in favour of the Congress candidate. Hamirpur parliamentary constituency has a very large number of ex-servicemen voters. The BJP candidate, Dhumal, has no background as an ex-serviceman. On the other hand, the Congress put up a retired major-general as its candidate. This earned him a substantial portion of ex-servicemen votes. Moreover, the Congress candidate belonged to the dominant rajput caste. As against this, the BJP candidate belonged to the minority middle caste. The Congress kept the social demography of the constituency in mind while selecting the party nominee for the Lok Sabha poll. In sum, one can say that the BJP's decision not to nominate its sitting MP in Kangra parliamentary constituency and the Congress strategy of putting up a retired general in the Hamirpur PC which has number of ex-servicemen led to routing of the BJP.

In the wake of such impressive electoral outcome the Congress government in the state began with a fairly high popularity rating. It seemed that the BJP would find it difficult to make inroads in its support base. The Congress Party's chances of retaining power during the vidhan sabha elections which were scheduled to be held in November 1998 seemed good. Despite such a favourable situation, the Congress apple-cart up-turned during the 1998 Lok Sabha poll which was necessitated by the sudden fall of the United Front government

consequent to the withdrawal of support by the Congress Party. The performance of Congress was poor. It could retain only one of the four seats that it had won in 1996. It is a reserved seat and 15 of its 17 assembly segments are in the old areas. Looking at the state as a whole one finds that while the Congress had led in 1996 in 55 of the 68 assembly segments; in 1998 it led only 17. Its worst performance in this election has not only been in Kangra or Hamirpur parliamentary constituencies both of which fall in the new areas, but also in Mandi which falls mostly in the old areas. In this constituency, the Congress Party had led in all the 17 assembly segments in 1996, but in 1998, it could maintain its lead only in two (Rampur and Nachan), both of which are reserved and fall in the old areas. The BJP showing in the state as a whole has been quite impressive. While in 1996, it had led only 13 assembly segments, in 1998, it led in 51.

The performance of the Congress Party in the 1998 vidhan sabha poll was equally unimpressive. While the party's tally of seats decline from 52 to 31, its vote share dropped from 49.3 per cent to 43.3 per cent. Constituencywise analysis shows that out of 52 wins in 1993, 22 of which were in the new areas and 30 in the old, the party could retain only 27 (seven in the new areas and 20 in the old).⁵ The party lost 15 in the new areas and 10 in the old. It won another four seats which it had lost in 1993.⁶ Three of these were won in 1993 by independents and one (Theog) by the BJP. On the other hand, the BJP retained seven out of eight seats that it had won in 1993.⁷ The BJP which had been groping for a substantive issue

on which it could challenge the ruling party suddenly rose to the occasion and made an impressive showing at the hustings.

Several factors contributed to this 1998 electoral somersault. Among them the most significant ones that need to be mentioned are the following.

Vajpayee factor: There was a general feeling in the country that in the Lok Sabha elections the BJP was most likely to emerge as the single largest party and was likely to form government at the centre, singly or in association with smaller parties. Given the fact that Himachal Pradesh suffers from acute financial crunch, the electorate usually votes for that party in the Lok Sabha and vidhan sabha elections whose chances of forming a government at the centre appear the brightest, for, that makes the flow of funds from centre to the state in the form of special grants possible.⁸ This factor weighs heavily with the electorate of the state. It was this consideration that prompted Virbhadra Singh to recommend the dissolution of state legislature one year in advance. And it did pay rich dividends to the party and it lost power to the BJP only by a whisker. It may be recalled that Congress won 31 of the 65 seats for which polling was held in February 1998. If the elections to the state legislature were held on schedule in November 1998 after the installation of a BJP government at the centre the chances were that the Congress tally would have been reduced to a single digit. This is amply borne out by the fact that the Congress lost all the three tribal assembly seats for which elections were held (in the second phase in June 1998) after the installation

Call for Papers

The INDIAN STATISTICAL INSTITUTE-Delhi Centre is organizing its Annual Conference on Economic Theory and Policy during November 29-December 1, 1999. Scholars are invited to submit completed research papers, which should reach the I.S.I. by **September 30, 1999**. Contributions will be refereed and decisions communicated to the authors by October 15, 1999. Participants will be paid AC 3 tier Rajdhani fares (return) and be provided local expenses and accommodation.

Papers should be mailed to: Professor Satya P. Das, Indian Statistical Institute - Delhi Centre, 7 S.J.S. Sansanwal Marg, New Delhi 110016. The packet should be marked "Conference Submission". Communications may also be directed to the email address: econf99@isid.ac.in

of Vajpayee government at the centre. Not only that, in the Lok Sabha poll held in June for the Mandi parliamentary constituency, the Congress conceded lead to the BJP in 15 of the 17 assembly segments, while the February 1998 vidhan sabha poll, the party had led in six of the 14 seats elections to which were held then.

Sukh Ram factor: The second factor that decisively upset the Congress apple-cart may be called the Sukh Ram factor. The former union communication minister, after his ouster from the Congress Party in the wake of telecom and other scams, floated a local political outfit called the Himachal Vikas Congress. Its presence made the electoral contest in the state virtually triangular. It was able to split the Congress support base. Although it could win only five seats it led to the defeat of Congress candidates in at least nine other assembly constituencies falling in three different parliamentary constituencies. The most impressive showing by the HVC was in the Mandi parliamentary constituency. In this constituency, polling for 14 assembly seats was held in the first phase in February 1998. Out of them the HVC won four (Mandi, Karsog, Dharampur and Balh). The BJP won four (Kullu, Banjar,

Chachisot and Sundernagar) and the Congress six. In the other three segments which are part of Mandi parliamentary constituency, the polling for vidhan sabha was held in the second phase in June and the BJP won two and the HVC one. Polling for the whole Mandi Lok Sabha seat was held in all the 17 assembly segments during the second phase. Here the BJP won in 15 and Congress in two (Raipur and Nachan). (Sukh Ram who was contesting the Lok Sabha election as the HVC candidate, retired from the contest in favour of the BJP candidates.) It is interesting to recall that in 1996, the Congress candidate, Sukh Ram, had led in all the 17 segments and in 1991 the Congress candidate had led in eight and the BJP in nine. Thus in 1998 Congress' performance was the worst ever in this constituency. The political clout of Sukh Ram which borders now on a sympathy wave has been so immense in his home district that the HVC which polled only 8 per cent vote on the whole, secured as high as 29 per cent votes in this district. The Sukh Ram factor alone can be said to have led to loss of power by the Congress in the state.

Dhumal factor: Third factor revolves round the candidature of Prem Kumar Dhumal. The decision of the BJP leadership to project him as its chief ministerial candidate instead of Shanta Kumar, proved quite productive. He had represented the party in the Lok Sabha from Hamirpur during 1989-91 and again during 1991-96. Unlike Shanta Kumar, he faced no hostility from any segment of the electorate. The fact that he belonged to the lower area as against his Congress counterpart become an important election issue in the lower areas, particularly in Hamirpur district where the BJP's vote share swelled to 56 per cent, 17 per cent higher than the state average. (Of course, the same is true of Congress vote share in the Shimla district which rose to 58 per cent, 15 per cent higher than the state average.)

Feudal factor: Another factor of which mention may be made, is the presence of several feudal elements in the Congress camp. The HVC and the BJP, particularly the former, projected Congress Party in the state as a feudal outfit. Although the BJP's Lok Sabha candidate from the Mandi parliamentary constituency (Maheshwar Singh) and vidhan sabha candidate from Banjar (Karan Singh), both belong to the erstwhile princely house of Kullu, they paled into insignificance when compared to the long list of Congress candidates in the fray which included the Raja of Rampur Bushehar (Virbhadra Singh), the Raja of Nalagarh (Vajinder Singh), the Rana of

Jubbal (Yogendra Chandra), the Raja of Kutlehar (Mahendra Pal), the Rani of Chamba (Sha Kumari) and Aishwarya Katoch (of a small fiefdom of Kangra). In addition, Pratiba Kumari (wife of Virbhadra Singh) was the Congress candidate from Mandi. The HVC supremo Sukh Ram during his election campaign articulated the view that his fight was against 'rajwadashahi'. In sum, one can say that discrimination against the lower areas, the entry of Sukh Ram's HVC into the electoral fray and the call given by him to overthrow rajwadashahi determined the outcome of the 1998 poll. The Congress articulated two issues: the issue of stability and the issue of equal development of upper and lower area. Of these two, the first did sell but not the second.

Notes

- 1 HP has only 0.6 per cent of the total population of the country and only 1.7 per cent of the total area. Nevertheless, populationwise it is larger than Sikkim and six of the seven sisters of north-east (Assam) being the only exception), and areawise it is larger than several states - Goa, Haryana, Kerala, Manipur, Meghalaya, Nagaland, Punjab, Sikkim and Tripura.
- 2 One must also keep in mind the pacifist nature of politics in Himachal Pradesh. It is quite unlike other hill states or hilly regions of the country which are often in the news for violent movements/agitations demanding greater autonomy. Sometimes these movements acquire secessionist overtones. However, Himachal in this respect continues to be a 'no news' state although it is no less strategically located. Because of the pacifist nature of its politics some of its very genuine and legitimate demands also get ignored as much by the centre as by the neighbouring states. There is also a tendency to treat the state as a fiefdom.
- 3 Constituencies in the new areas where the BJP won are Nadaun, Hamirpur, Gagret, Gangath, Jaswan, Pragpur, Palampur, Sulah, Nagrota, Dharamsala, Kullu, Shimla, Bamsan, Una, Jawah, Jawalamukhi, Kangra, Banjar, Ani and Nadaunia. Constituencies in the new areas where the Congress won are: Chintpurni, Nurpur, Nalagarh, Mewa, Thural, Santokhgarh, Bajgir, Guler, Baijnath and Lahaul-Spiti.
- 4 These ten are: Shimla, Nalagarh, Thural, Palampur, Sulah, Hamirpur, Bamsan, Mewa, Nadaunia and Pragpur. The three segments in the old areas are Gehrwin, Banikhet and Bhatnagar.
- 5 Seven in the new areas are: Gagret, Una, Jaswan, Baijnath, Guler, Palampur and Ani.
- 6 These are Chopal, Nagrota, Nachan and Theog.
- 7 These are Bilaspur, Hamirpur, Mewa, Kulthar, Pragpur, Thural and Dharamsala.
- 8 This expectation of the electorate has been substantiated more than once. In fact the present Vajpayee government within three months of its installation sanctioned to the state a special grant amounting to Rs 2 billion.

New Phase in Backward Caste Politics in Bihar

Janata Dal on the Decline

Sanjay Kumar

The process of realignment of social forces began in Bihar in the 1970s prompted by the aspirations of the middle caste groups for a share in political power. This process was most evident in the first half of 1990. The changing social composition of political representation today is a clear indicator that these caste groups have come to play a major role in state politics. However, 'backwardism' may not be the nature of politics in Bihar in the future, with the assimilation of larger social groups.

BIHAR, economically, educationally and socially one of the most backward states of India, is also politically one of the most important not only because this Hindi heartland state accounts for 54 Lok Sabha seats, but also because the long process of democratisation has inculcated a sense of great empowerment among the people. The backward castes started sensing this empowerment as early as in the mid-1970s – a feeling which, in a way, fully bloomed in the early 1990s with the advent of Laloo Yadav as the chief minister. When he implemented welfare programmes for the lower sections of society, especially the dalits. In a state where traditionally, political power had remained with the upper-castes for a long time, this desire among the middle-caste groups for a share in power was bound to bring forth a process of social and political change leading to the realignment of newly emerging social forces. This process of realignment started in Bihar in the mid-1970s, initially a bit faltering, but came into its full form in the first half of the 1990s, giving way very soon, to the process of 'dealignment' of these social and political forces.

This process of democratisation was not something which emerged suddenly, but was the culmination of long drawn political movements in the state, which date back to the pre-independence period. With nearly 80 per cent of the population depending upon it for their livelihood, agriculture formed the mainstay of Bihar's economy. But agricultural land remained monopolised by the three upper-castes – the rajputs, the bhumihars and the brahmins. The people belonging to the upper layer of the backward castes namely the yadavs, the kurmis or the koeris were left with very little land. But for some exceptions, other lower castes were mainly landless. During the pre-Independence period, the movement for land reforms was led by people like Swami Sahajanand Saraswati and Karyanand Sharma under the leadership of the Kisan Sabha. Since it was mainly the upper-castes who owned

land and were masters of social and political power, such movements got inevitably directed against them. It was mainly the backward castes owning some land, who formed the backbone of the movement, as they perceived a direct benefit from such reforms. Though it could not be carried to its desired results, some redistribution of land as a result of the Bhoodan Movement led to the breaking of the hold of the upper-castes over the land to a great extent.

With a bit of land and with the diversification of their occupational patterns, these backward castes were able to improve their economic status and emerged as a newly-rich rural agrarian class, popularly known as the 'kulaks', and started to play an important role in the social and the political sphere. On the other hand, such struggle also sowed the seeds of a sense of empowerment among the people. This assertiveness kept growing in some form or the other with various social and political movements, but took on a particularly intense form in the mid-1970s with the movement led by Jai Prakash Narayan in which, though it was an all-India movement, Bihar played a leading role and provided the backbone. This long-drawn movement ultimately led to the change of guard at the centre. As a fallout, these newly emerging 'kulaks', at least in Bihar, played an important role in this change of scenario.

The social struggle in the mid-1980s and in the 1990s, particularly in central Bihar, it has certainly inculcated a sense of empowerment among the deprived people actively associated with it though it could not bring about major changes in the social, political and economic spheres. This has been reflected in the various elections held in recent years. The increasing number of contestants in the successive Vidhan Sabha and Lok Sabha elections, and the increasing turnout over the years, bears testimony to it. The total number of contestants which was 1,602 during the 1952 Vidhan Sabha election

has gone up to 8,463 in 1995. In the same way, from 198 contestants during the 1952 Lok Sabha elections, the number has gone up to 1,448 in 1996 but declined to 451 in 1998 because of several restrictions imposed for contesting the election. The turnout of voters has also increased phenomenally, during this period. From 39.7 per cent during the 1952 Vidhan Sabha election, the turnout has gone up to 61.8 per cent in 1995. The 1998 Lok Sabha election witnessed a 64.6 per cent turnout as compared to 59.5 per cent turnout during the 1996 Lok Sabha election. The state which witnessed only 39.7 per cent turnout in 1952 Lok Sabha election, has certainly moved ahead towards the process of democratisation. Such struggles by different sections of the society has led to the process of alignment, realignment and even dealignment of various social forces which is reflected on the political map of the state.

Though the country began to see some political change as early as in mid-1960s, reflected in the form of various non-Congress governments coming to power in different states in 1967 (Bihar being one of them), it was in 1977 that the monopoly of the Congress Party was broken at the centre for the first time and the Janata Party came to power. Non-Congress governments were installed in a large number of states as well, with thumping majorities. This central government did not last long and the Congress returned to power in 1980. It was only nine years later that once more, a new formation in the shape of the Janata Dal came to power at the centre. In the formation of these two non-Congress governments, Bihar played a major role, returning a large number of non-Congress representatives to the parliament during these two Lok Sabha elections. The Congress drew a blank and its vote went down to 22.9 per cent during the 1977 Lok Sabha election as compared to 39 seats won and 40.1 per cent votes polled during the previous Lok Sabha election held in 1971. In the Vidhan Sabha

election held in 1977, the Congress representation was reduced to 57 seats as compared to 168 seats won during the 1972 Vidhan Sabha election. The Congress lost nearly 10 per cent votes during these two elections as its vote went down to 23.6 per cent in 1977 as compared to 33.1 per cent in the 1972 Vidhan Sabha election. The Congress regained much lost ground in the 1980s but again during the 1989 Lok Sabha election, it suffered a major setback. As compared to 48 seats and 51.8 per cent vote in 1984, the party managed to win only four Lok Sabha seats and its vote went down to 28.1 per cent during the 1989 Lok Sabha election, while the Janata Dal won 31 seats with 36.4 per cent vote and the CPI and CPI(M) won four and one seat respectively, with 7.9 and 1.4 per cent vote.

Traditionally a Congress stronghold, the success of a large number of non-Congress representatives in the state, was possible mainly because of the realignment of the backward castes who generally voted against the Congress in both these elections. So the process of realignment which started in the mid-1970s and took the full shape in early 1990s, is now giving way to a process of de-alignment among the forces of the backward castes. This is reflected in the form of the consolidated backward castes further breaking apart and a section of them aligning with the upper-castes to put up a challenge to the dominance of one section of backward castes represented by the Yadavs.

ASSERTION OF THE 'BACKWARD CLASSES'

The real shift in the political sphere was reflected in the outcome of the 1995 Vidhan Sabha polls. It witnessed the assertion of backward caste politics in Bihar and ushered in a scenario which may stay for sometime to come. The state went to the polls in a polarised situation of a unique type. The polarisation was not on the lines of the upper and the backward caste divide, but it was around the two axes of backward caste politics. Laloo Yadav after completing his term in office even with a minority government went to polls in a situation where an anti-incumbency wave was sweeping the country. The consolidated backward castes had fragmented into two blocs, one represented by the Yadavs in the form of the Janata Dal and the other represented by the Kurmis and Koeris represented by the Samata Party. For the first time, the upper-castes felt totally marginalised in the state's politics since the support base of their natural ally, the Congress, has been completely eroded, while the BJP was unable to make much inroads among the voters.

The Janata Dal contested the elections with its traditional alliance partners, the CPI, CPI(M) and JMM whereas the BJP, Congress and BPP contested alone, leaving only the Samata Party and the CPI(ML) to enter into an alliance. The results of the 1995 Vidhan Sabha election came as a surprise to many. Belying many expectations, the Janata Dal returned to power with an absolute majority winning 166 of the total 324 seats with 27.9 per cent votes, with its alliance partner CPI getting 26 seats with 4.8 per cent votes, CPI(M) getting 6 seats with 1.3 per cent votes and JMM capturing 16 seats with 3.7 per cent votes. Continuing the row of surprises, the BJP won 41 seats with 12.9 per cent votes and acquired the position of the opposition party relegating the Congress to the third position. The Congress could only manage to win 29 seats with 16.4 per cent votes.

The Janata Dal's performance was an all round success. Except for some poor performance in the south where it could just manage to win 13 seats with 14.8 per cent votes, its performance in North and Central Bihar was spectacular. Of the total 138 seats in north Bihar, the Janata Dal won 97 seats with 34.9 per cent votes. In central Bihar, it won 54 seats with 20.1 per cent votes, out of a total of 92 seats. The BJP did well in south Bihar winning 21 of the total 94 seats in the south, with 18.3 per cent votes. The performance of the Congress was bad throughout the entire state.

The success of the Janata Dal and its allies was due to the fact that the alliance drew large measure of support from the numerically strong, poor and deprived sections of society. A survey conducted by the CSDS, in a representative sample of 16 assembly constituencies spread across all the three regions of Bihar, reveals massive support for the Janata Dal and its allies specially among the Dalits, the Backwards, the Muslims, the illiterate, the landless and among agricultural labourers. Nearly 48.7 per cent of the Dalits, 49.8 per cent of the Backwards, and about 57.3 per cent of the Muslims voted for the Janata Dal and its allies. It remained the most popular party among the downtrodden as 47.3 per cent of the illiterate and 43.8 per cent of the landless also voted for it. The support base of the Congress has eroded in general, but still it seems to be a popular party among upper-castes. Of the upper-caste voters, 39.1 per cent voted for the Congress while only 20.9 per cent of them voted for the Janata Dal. Though the BJP managed to win 41 Vidhan Sabha seats, it still lacks a broad support-base in Bihar.

Except for 19.0 per cent votes among the tribals, 16.5 per cent votes among the upper-castes and 18.3 per cent votes among the people living in 'pucca' houses (a denominator of urban habitat), its support base among the other sections remained still very low.

The biggest surprise was that even though Laloo Yadav has been constantly blamed for neglecting developmental work, he still drew large support from the largest sections of society. If one takes a deeper look into the functioning of the Laloo government, during the past five years one can understand why the poor and the Dalits,

have voted for the Janata Dal. The dalits in general overwhelmingly supported Laloo Yadav. They were not satisfied with his performance for, besides constructing some houses under the Indira Awas Yojana for the musahars, the poorest among the poor dalits, nothing much has been done for them. But for many, it was the only occasion in their lifetime when they could vote. They reiterated that for them 'azadi' came only during Laloo's regime as now they enjoy a sense of self-pride and that upper-caste people do not encroach upon their independence now.

The backward castes, particularly the yadavs, had reason to vote for Laloo, since they did not want to let the power they had gained after a long struggle slip from their hands. Though during this election the two dominant backward castes, the kurmis and yadavs contested the electoral battle against each other, the Samata Party was blamed for fighting a proxy war for the upper-castes in the name of fighting the casteist politics of Laloo Yadav. Such a feeling consolidated the other backward castes, besides the kurmis and koeris, behind the Janata Dal. The Muslims, except for a few instances where personal affiliation with the candidate or his otherwise very clean image mattered, voted largely for the Janata Dal. The instance of the Bhagalpur riots was still fresh in the minds of the Muslims. Further, the arrest of the BJP leader, Lal Krishna Advani at Samastipur by Laloo Yadav at the time of his 'rath yatra' seems to have made Laloo Yadav a great hero among them, generally. Besides, in the aftermath of the demolition of the Babri Masjid, when the whole country was reeling under the monster of communal violence, and a large number of people were killed in riots which continued unabated for almost five days, it was Laloo Yadav, who stood for the protection of the Muslims in his state. When the whole country witnessed mad riots, there was not a single riot or instance of violence in Bihar. The kind of protection given to Muslims during Laloo raj was unprecedented, and ever since the Muslims clearly identify themselves with the Janata Dal.

The result of the 1995 assembly election in Bihar set the trend for backward caste politics. It was the first time the backwards fought against backwards and the upper-castes at best remained at the margins of the political struggle. The backwards managed to have a firm control over political power. It was the type of political struggle which Bihar witnessed then that set the trend for backward caste politics for the next few years. One of the major

achievements and change this time was that most of the most deprived sections, the dalits, were allowed to vote for the first time. Though the yadavs took the driver's seat in the matter of governing the state, the other backwards, and the dalits remained aligned with the Janata Dal. They feel that whatever else may happen, they do have share in the political power in the state. During the Congress regime, power remained monopolised by the upper-castes and never was a serious attempt undertaken to incorporate the aspirations and the demands of the dalits and backwards within the general governance of the state. A share in power was a distant dream for them during the Congress regime.

The period since the mid-1990s, witnessing the process of rapid de-alignment of electoral forces, led to a major shift in the politics of the state as indicated earlier. The results of the 1996 Lok Sabha elections demonstrate that a new beginning has been made in the politics of Bihar. The Janata Dal and its allies suffered major setback in these Lok Sabha elections which provide more than one indicator. First they clearly point towards the limits of the sectional politics in a multicultural society. Further, they demonstrate the constraints for a ruling party in a multi-party democracy, when the index of opposition unity is greater than expected. In a multi-party democracy, where a political party captures political power with barely 30 percent votes, it is exposed to severe limitations once the divided opposition unites against the ruling party.

The results of these elections, clearly followed from such a scenario. During the Vidhan Sabha election held only a year back, the Janata Dal and its allies CPI, CPI(M) and JMM(S) fought a badly divided opposition. Though the Samata Party had some understanding with the CPI(ML), but mainly it was the BJP, the BPP, the Congress and a few other smaller parties, who opposed the Janata Dal and its allies separately. With a badly divided opposition, the net result was that with merely 27.9 per cent vote, the Janata Dal managed to get an absolute majority with 166 seats, and its allies CPI, CPI(M) and

JMM(S) won 26, 6 and 16 seats respectively, with merely 4.8, 1.3 and 3.7 per cent votes. The divided opposition, with sectional support, was badly trounced in the electoral battle during the Vidhan Sabha election. A lot of people had great faith in the Samata Party, which had just been formed on the eve of elections. It was generally thought that this party may provide an alternative to the ruling Janata Dal. A party formed mainly by the defectors of the Janata Dal and with Nitish Kumar as its leader, it was expected that the party will draw large support from the kurmis and the koeris. But the party performed badly winning only seven seats with merely 6.9 per cent votes. The Congress with the support of just the upper-castes, went down to a mere 29 seats with 16.4 per cent votes. The BJP, though it managed to improve its tally, winning 41 seats with 12.9 per cent votes, however, remained far behind its dream of calling the shots in Bihar.

After the success in the Vidhan Sabha election, Laloo Yadav had been bubbling with confidence and it seemed as if the Janata Dal has become an invincible party in Bihar. The political parties opposing the Janata Dal realised their weaknesses and very soon after the Vidhan Sabha election after various rounds of talks, the Samata Party and the BJP entered into an alliance. Though both the political parties had different support-bases and ideological perspectives, the Samata Party largely desiring the support of the kurmis and koeris and having a socialist perspective and the BJP, a right wing party, popular among the upper-castes, entered into an alliance where BJP contested for 32 seats leaving 22 seats for the Samata Party. Leaders of both the political parties welcomed this alliance, but the leaders of the Samata Party particularly George Fernandes and Nitish Kumar who swore by the socialist tradition were put to severe criticism on account of their alliance with a communal party. These leaders termed it a special arrangement needed for a special time in a special state. They termed it 'the need of the hour' in Bihar if one has to put up a challenge to the casteist politics of Laloo Yadav. Earlier, the Bihar People's

Party of Anand Mohan Singh which had been completely routed in the Vidhan Sabha election, merged with the Samata Party. Since it drew some support from the upper-caste Rajputs, it was perceived that this alliance may broaden the base of the Samata Party much beyond the support of only the backward caste. Entering into an alliance with the BJP certainly was a step towards forming a front against the Janata Dal. The other opposition party, the Congress, which has been marginalised to a great extent, contested the election alone, like the splinter groups of the JMM parties. The Janata Dal on the other hand, contested along with its traditional partners CPI and CPI(M). But as compared to earlier elections, the only change reflected was in terms of seat sharing as Laloo completely dominated over his alliance partners, the CPI and CPI(M). Of the total, Janata Dal contested 44 seats leaving only eight for the CPI and 2 for the CPI(M).

Though Laloo Yadav seemed confident of winning most of the seats in Bihar, he was put on the defensive by the opposition parties which carried a virulent campaign against the fodder scam unearthed during the period of the Janata Dal government. On the other hand, the Janata Dal championed the cause of the upliftment of the backwards and the poor and stood on the platform of social justice. It called upon the people to vote for Janata Dal and its allies and to save Bihar from the threat of the communal party namely, the BJP. On the other hand, the BJP and Samata combine accused Laloo Yadav of perpetuating casteist politics in Bihar in the name of social justice. They blamed the government for the fodder and other scams that occurred during the Laloo regime. Though the hawala issue could not make a dent as an election issue among the poor rural masses of Bihar, the fodder scam popularly termed as 'gawala' scam received a wide publicity among the people. In the beginning it seemed as if this scam will have little bearing on the minds of the people and may not affect the electoral prospects of the parties. Two rounds of pre-election surveys conducted by CSDS showed that the Janata Dal still remained the most popular party among the people. Of the total respondents 32.9 and 40.3 per cent intended voting for the Janata Dal in the first and the second round respectively, whereas the support base for the BJP was 7.9 and 9.9 per cent only.

But things changed very fast as soon as the election approached nearer. The virulent attack on the Janata Dal and its policies by the BJP and its alliance led to a last minute change in the mood of the

people at large. The kurmis and koeris had already responded and reposed full faith in the BJP-Samata alliance, but the brahmins and other upper castes, which traditionally used to vote for the Congress changed their loyalty very fast and shifted support to the BJP-Samata alliance. Such a last minute shift of the voters led to some surprise results.

The party which won an absolute majority in the Vidhan Sabha election barely a year ago, was cut to size, even though its leaders had been bubbling with confidence, claiming that they would win all seats. The Janata Dal managed to win only 22 seats as compared to 33 seats won during the 1991 Lok Sabha election. Its vote went down by nearly 2.2 per cent as it could just manage to get 31.9 per cent votes as compared to 34.1 per cent vote in 1991 Lok Sabha election. Its alliance partners, the CPI and CPI(M), also suffered major losses. The CPI lost more than half of the seats and won only 3 Lok Sabha seats as compared to eight seats won during the 1991 Lok Sabha election. Its vote was drastically reduced from 7.6 per cent to 5.1 per cent in 1996. The CPI(M) could not even retain its lone Lok Sabha seat won during 1991 Lok Sabha election.

The BJP, in alliance with the Samata Party, became the major gainer. The BJP won 18 Lok Sabha seats with 20.5 per cent votes as compared to five seats won during the 1991 Lok Sabha election with 15.9 per cent votes. But actually the increase in the vote of the BJP is much higher than it appears since, in the 1996 Lok Sabha election, it contested only 32 Lok Sabha seats as compared to 51 seats contested during 1991 Lok Sabha election. The Samata Party won six Lok Sabha seats contesting 22 seats and its vote went up by nearly 7.6 per cent as compared to its votes during the 1995 assembly election. Though the Congress doubled its tally from one to two, its vote went down from 24.2 per cent in 1991 to 13.0 per cent in 1996. The JMM which won six seats during 1991 Lok Sabha election suffered a major loss. Though the party lost much ground in its traditional tribal belt of south Bihar, it also suffered a loss because its various factions fought against each other, result-

ing in the split of the votes. The JMM(S) only managed to win a lone Lok Sabha seat with a slender margin of only 5,000 votes.

LOK SABHA ELECTION 1998

The premature dissolution of the Lok Sabha pushed the country towards another Lok Sabha election much sooner than expected. Even in this short duration, the political scenario in Bihar had taken a major turn. The mounting pressure on Laloo Yadav, from the left parties and even from within his own party, to step down from the post of party president and the chief minister of the state was resisted and rebutted by Laloo Yadav. This resulted in the split in the Janata Dal leading to the formation of Rashtriya Janata Dal by Laloo Yadav before the 1998 Lok Sabha election. Formation of the new party led to the possibility of fresh realignment among various competing political parties.

Though there was no major shift in the already existing alliance among the dominant political parties, the BJP maintained its alliance with Samata Party and the left-over Janata Dal still retained its alliance with the CPI and the CPI(M). The Congress, which performed badly during past few elections was desperately looking for ways towards revival. Though Laloo Yadav tried to pretend confident of achieving big success in the election, in reality he knew that it is not going to be too easy for him in this election. Three major factors seemed to be working against Laloo Yadav. Firstly, he feared possible division in the Yadav vote which may indirectly help BJP in winning more seats; secondly, he knew it would not be too easy to make people familiar with the new symbol 'lamp' allotted to Rashtriya Janata Dal. Thirdly, he realised that the absence of a party organisation at the local level may add to the problems for his new party. Because of these considerations Laloo Yadav was looking for an alliance to at least minimise the split of vote. He naturally found the desperate Congress which was also in search of an alliance partner. The Jharkhand Mukti Morcha (JMM), a party that was very strong in the south Bihar region in the 1991 Lok Sabha election,

TABLE 4: ELECTORAL PERFORMANCE IN SOUTH BIHAR, LOK SABHA ELECTION 1991-1998

Note: Total Seats 14
Source: CSDS Data Unit.

performed badly during the 1996 elections because of division in the party, was also searching for an alliance. Laloo Yadav knew his party has very little presence in south Bihar and wisely so, entered into an alliance with the JMM.

With this alliance pattern, Bihar seemed to be heading towards a three-cornered contest. With the split in the party, the Janata Dal was put to a severe test, as also the assumption that the division of votes will result in a major loss for the party. The Rashtriya Janata Dal (RJD) and primarily its leader Laloo Yadav was to be tested for his personal charisma. Many believed that the RJD may not be successful as Laloo Yadav after his involvement in the fodder scam has become a spent force in the state's politics and it would be hard for the party to win some seats. With the alliance with the Congress and the JMM, Laloo Yadav hoped to put up a contest in north Bihar on account of the shift of the traditional Congress voters still with the party towards the RJD. With 12.2 per cent vote polled by JMM and 16.0 per cent vote polled by the Congress in the south Bihar region in the 1996 Lok Sabha election, the alliance hoped to put up a formidable contest in south Bihar. The BJP-Samata combine hoped to hold together and gain most from the three-cornered contest resulting in a split in the anti BJP vote.

The results came as a major surprise for many a political speculator. Though the Bihar elections were speculated by many to be a three-cornered contest, they actually turned out to be a direct contest between Laloo's RJD and the BJP-Samata combine, with the Janata Dal and its allies putting up no contest at all. But the results reveal that the 1998 Lok Sabha election was more keenly contested than the past few elections. The last three Lok Sabha elections in the state have witnessed a narrowing down of the victory margin in a large number of constituencies. As compared to only six and 10 constituencies where the results were decided within the margin of less than 5 per cent vote in 1991 and 1996, in 1998 Lok Sabha election in as many as 18 constituencies the victory margin was less than 5 per cent and in another 16 constituencies the victory margin was between 5 to 10 per cent. The narrowing gap of the victory margin in the 1998 Lok Sabha election indicates that the state witnessed more competitive politics as compared to past few elections.

The 1998 Lok Sabha election virtually witnessed an end for the Janata Dal in the state. Ram Vilas Paswan was the only Janata Dal candidate who won from the Hajipur Lok Sabha constituency. The party

only managed to get 8.3 per cent vote as compared to 31.9 per cent it polled during the 1996 Lok Sabha election. Its alliance partner the CPI and the CPI(M) could not win a seat and polled as low as 3.1 and 2.1 per cent vote, respectively. Belying the popular expectations, the RJD won 17 seats and polling 25.2 per cent vote still emerged as the largest party in terms of the vote. Though the Congress got only 7.2 per cent vote, nearly 6 per cent less than it polled during the 1996 Lok Sabha election, it managed to win five seats and regained some of its lost ground. The fewer votes for the party is largely attributed to the fewer seats it contested in the election on account of the alliance with RJD. In spite of the triangular alliance, the JMM could not open its account and polled 3 per cent vote. As an alliance, BJP-Samata combine turned out to be the major gainer in the 1998 Lok Sabha election. With the BJP getting 19 seats with 23.1 per cent vote and Samata winning 10 seats with 15.8 per cent vote, the alliance won 29 seats improving its tally of 24 in the 1996 Lok Sabha election.

The overall result of these elections indicates that Janata Dal which witnessed decline over past few elections has been nearly wiped out in the 1998 Lok Sabha election. The BJP-Samata alliance is getting stronger and stronger over past couple of elections. In order to look at the strength of these parties it is better to have a look at the performance of different parties in the three distinct geographical regions i.e., the north, central and the south Bihar.

The poverty stricken, flood prone terrain of north Bihar accounting for 26 Lok Sabha seats, is politically the most important region of Bihar. It has been a stronghold of the Janata Dal during the past few elections. During the 1991 Lok Sabha election, the Janata Dal won 22 seats from this region with 48.3 per cent votes, and with CPI winning three seats, the combined tally for the alliance was 25 seats. But in the 1996 Lok Sabha elections, the Janata Dal suffered a loss of six seats in this region. It won only 16 seats with 40.3 per cent votes. The CPI won two seats bringing the combined tally to a total of 18 seats.

The BJP, which drew a blank here in the 1991 elections, with its alliance partner Samata Party managed to win six seats with 33.8 per cent votes. The 1998 Lok Sabha witnessed further gains for the BJP-Samata combine in the region as the alliance managed to win eight seats and polled 35 per cent vote. The Janata Dal and allies overall performed badly in the state, but could still manage to save face in the north Bihar polling 18.3 per cent vote and won its lone seat from this region. The RJD virtually swept the polls in this region, winning 14 seats and polling 29.4 per cent vote. The success of the party gives the indication that Laloo Yadav still remains a major force in the politics of the state. With the division of vote, though the Janata Dal managed to get a reasonable vote in the region, Laloo's popularity affected it adversely in a significant manner. The alliance with the RJD helped the Congress to win two seats in the region while it polled only 5.5 per cent vote.

The mineral rich hilly terrain of south Bihar, accounting for 14 Lok Sabha seats, is the region where the BJP has a strong presence. The BJP has not only remained the most dominant party in South Bihar, but it virtually swept the polls in the entire region during last two Lok Sabha elections. As compared to the five Lok Sabha seats it won during the 1991 Lok Sabha election, BJP managed to win 12 of the total 14 seats from this region both in 1996 and 1998. But this does not mean that there was hardly any change for BJP in south Bihar. The BJP increased its votes share enormously in this region. As compared to 34 per cent vote in 1996 Lok Sabha election, the party polled 45.5 per cent vote during 1998 Lok Sabha election. The alliance of the RJD with the Congress and the JMM was expected to spring few surprises in this region, but the alliance could hardly make its presence felt. The JMM which has won the lone Dumka seat in 1996, where the party president Shibu Soren won by a slender margin of about 5,000 votes, drew blank and its vote also went down from 12.2 per cent in 1996 to 10.5 per cent in 1998. The RJD also could not open its account and polled only 9.2 per cent vote. It was the Congress which

registered some gain in this region. Contesting for all 14 seats the party won only one seat and polled 16 per cent vote in 1996. In sharp contrast the Congress contested only seven seats in 1998 but managed to win two seats and polled 15.7 per cent vote. If we compare the 1991 and 1996 Lok Sabha elections we find that the Janata Dal with its allies increased its vote from 12.5 per cent to 24.3 per cent in 1996, but in the 1998 Lok Sabha election the alliance suffered a major loss and its vote plumped down to only 6.2 per cent.

The agriculturally rich central Bihar, accounting for 14 Lok Sabha seats, is the region which has witnessed numerous agrarian struggles during the post-Independence period. These struggles of the poor and the landless farmers have mainly been led by the various factions of the Left parties. The Janata Dal and other Left parties are particularly strong in this region. Though the Janata Dal remained the dominant party in this region, it faced a stiff challenge from the BJP-Samata combine during the 1996 Lok Sabha election. The Janata Dal and its allies who had won 13 of the total 14 seats from this region during the 1991 Lok Sabha election suffered a major loss as the alliance got only seven seats (JD-6, CPI-1) in 1996 with the Janata Dal getting 25.1 per cent and the Left parties getting 10.6 per cent votes. During the 1998 Lok Sabha elections, the JD and its allies lost heavily even in the traditional stronghold of the left. The alliance not only drew a blank but even its vote went down to only 8.0 per cent. The BJP-Samata alliance remained the biggest gainer even in this region during the last two Lok Sabha elections. The BJP which drew a blank in 1991, in alliance with Samata party managed to win 6 seats with 37.9 per cent votes in 1996. The alliance further improved its tally to 9 seats and its vote increased to 42.8 per cent during the 1998 Lok Sabha election.

CHANGING SOCIAL BASE OF POLITICAL PARTIES

A comparison of last four elections shows that the Janata Dal which remained the most dominant party till the 1996 Lok Sabha has been nearly wiped out during the 1998 polls. During the 1996 elections, the JD polled 31.9 per cent vote as compared to 34.1 per cent in the 1991. The erosion of the vote for the party during the 1998 polls was so much that it polled only 8.1 per cent vote. It was RJD which made inroads among the voters of the Janata Dal. The BJP which polled 15.9 per cent vote during the 1991 Lok Sabha

election has made heavy inroads in Bihar politics during and after the 1996 Lok Sabha election after entering into an alliance with Samata Party. The party polled 20.5 and 23.1 per cent vote during the 1996 and 1998 elections. This increase is marked even though the party contested 20 seats fewer than it did in 1991. The Janata Dal drew reasonably higher support from the backwards, the dalits and the Muslims, than other sections of society, while the BJP has made inroads particularly among upper-caste voters. But a comparison between three surveys (1995 assembly election, 1996 and 1998 Lok Sabha elections) conducted by the Centre for the Study of Developing Societies gives a clear picture that the social groups which had earlier supported the Janata Dal have started deserting the party in the recent years.

The increasing presence of the BJP in Bihar is largely credited to its growing popularity among the upper caste voters. Traditionally Congress supporters, they have moved towards the BJP and its alliance partner, the Samata in a big way during the past two Lok Sabha elections. Table 6 shows that the BJP which got only 28.7 per cent of the upper caste votes in 1995, has got 77.6 per cent of their vote in 1998. The popularity of the Congress among the upper caste voters has declined considerably. The JD and its allies have never been a popular choice among the upper caste voters. During the 1998 election, even RJD could hardly get substantial support from the upper caste voters.

The OBCs have come to play an important role in the politics of the state during the last decade. The Congress has not been very popular among the OBC and traditionally they have supported the socialist formations. The formation of the Janata Dal before the 1989 Lok Sabha election saw a large section of the OBC voters moving towards the party. The two surveys of 1995 and 1996 show that they voted in large numbers for JD and its alliance. The alliance of the BJP with the Samata Party before the 1996 Lok Sabha

election witnessed a shift among the OBC voters towards this alliance. During the 1998 election, 42.5 per cent of the OBC voters voted for the BJP alliance, while support for the JD alliance went down from 50.3 per cent in 1996 to 17.3 per cent in 1998. The RJD also managed to poll 28 per cent of the OBC vote. The support for the Congress among OBC voters which was just 13.7 per cent in 1995 further went down to 7.9 per cent in 1998.

The past decade has witnessed decline of support for the Congress among the Muslims. The alienation of the Muslim from the Congress began soon after the Bhagalpur riots and continued further after the demolition of the Babri masjid. Disenchanted with the Congress, the JD and allies became the natural force towards which the Muslim vote in the state gravitated. Figures from the last three surveys indicate enormous support for the alliance during the 1995 Vidhan Sabha

and 1996 Lok Sabha elections among the Muslim voters. But the split in the Janata Dal has led to the erosion of support for the party among the Muslims. From 68.9 per cent vote among the Muslims in 1996 Lok Sabha, the alliance got only 19 per cent while 59.6 per cent Muslims voted for the RJD. Even in alliance with the Samata Party, the BJP has hardly been able to attract the Muslim voters.

The survey data presented in Tables 6, 7 and 8 do reflect that during last few elections there is a shift among the upper caste voters towards the BJP while the majority of OBC and Muslim voters still favoured the Janata Dal till 1996 and RJD in 1998 Lok Sabha election. But does it mean that the various 'jatis' within these caste groups vote in a similar pattern?

Neither the upper castes nor the OBC constitute one monolithic group but comprise various jatis. While the rajputs, the bhumihars, the brahmins and the kayastha constitute the upper caste, there are larger number of jatis which are categorised as the OBC. The yadavs, kurmis and koeris constitute the upper OBC while the kahar, kumhar, lohar, tatwu, teli, dhanuk, etc, constitute the lower OBC. Even among the Muslims, there is the hierarchy of upper and lower jati. Is the voting pattern of various jatis within these three caste groups, ie, the upper caste, the OBC and the Muslims similar when there is immense social and economic disparity among them? The detailed analysis of the survey shows the voting pattern of various jatis within the same caste group.

The detailed analysis of the data reveals that unlike the four upper castes, there is a great internal variation in the voting pattern among the various jatis of the OBC. The Janata Dal was very popular among the yadavs till the 1996 Lok Sabha election, but after the split of the party, it is the RJD which cornered a majority of the yadav vote. It is important to note that the yadavs were extremely polarised in favour of the JD till the 1996 Lok Sabha election, but the 1998 Lok Sabha election has also marked the split of the yadav vote between the JD, the RJD and the BJP-Samata alliance. Interestingly the BJP-Samata alliance got more yadav votes than the JD.

The voting pattern of the kurmi-koeri combine is quite in contrast to that of the Yadavs. While during the 1991 Lok Sabha election, although the BJP got the largest support from these jatis, still the Kurmi-Koeri vote was split among the Congress and the JD and its allies. The 1996 Lok Sabha elections witnessed a sharp polarisation of the support base. Both the

Congress and the JD and allies lost support among these two jatis while the BJP-Samata combine consolidated support among the kurmis and koeris. During the 1998 Lok Sabha election, some of these voters moved away to the Congress and the RJD.

Over last few elections, the lower OBC castes have displayed a divided loyalty towards different parties. In spite of a clear pattern of their movement towards BJP-Samata alliance, only a little over half the voters of these jatis opted for the BJP-Samata alliance during the 1998 Lok Sabha election. The JD and allies are still popular among these jatis. The popularity of the Congress has declined to a great extent among the jatis belonging to the lower OBC caste group. There is also differential support structure for the political parties among the upper caste Muslim and those belonging to the lower caste. It is true that over the years the Congress has lost support among the Muslim voters, but the party is still popular among the lower caste Muslims. The support for the party in category has declined marginally during the past three Lok Sabha elections. The JD and allies has been very popular among the Muslim voters up till 1996 Lok Sabha elections, but the split in the JD also resulted for the split among the Muslim support for the party. A majority of both the upper caste and the lower caste Muslims supported the RJD in the 1998 Lok Sabha elections while the JD and allies lost support among the Muslim voters to a great extent. The survey shows that the support for the RJD is more among the upper caste Muslim as compared to the lower caste Muslims. The data also indicates a shift among the Muslim voters towards the BJP-Samata alliance. The small sample size in this category does not facilitate further analysis, but the shift among the Muslims may be attributed to the alliance of the BJP with the Samata Party during the last two Lok Sabha elections. The small sample size of the voters belonging to other OBC castes and the STs does not permit a reliable inference about their voting pattern.

There is also considerable shift among the dalit voter over past few elections. Traditionally Congress voters, nearly half of the dalits have preferred voting for JD and its allies while 23 per cent voted for the Congress during the 1995 Vidhan Sabha election. The BJP was a popular choice of the dalit voters during that election. But things started to change thereafter. The state witnessed a slow but constant movement of the dalit voters from the Congress to other parties. While a

Upper Caste	41.8	38.3	36.4	32.5	17.1
Backward Caste	24.2	26.7	24.6	29.7	45.0
Muslim	5.6	5.9	10.1	6.1	7.1
Women	3.4	1.2	4.0	4.0	2.8

TABLE 14: CASTE COMPOSITION OF BIHAR ASSEMBLY, 1995

Caste	Share in Population (Per Cent)	Share of Seats (Per Cent)	Quotient
Upper Caste	13.0	17.1	1.3
Rajput	4.2	6.8	1.6
Brahmin	4.7	3.4	0.7
Bhumihar	2.9	5.3	1.8
Kayastha	1.2	1.5	1.2
Middle Caste	19.3	45.0	2.3
Yadav	11.0	26.0	2.3
Kurmi	3.6	6.1	1.6
Koeri	4.1	8.7	2.1
Vaishya	0.6	6.1	10.1
Low Backward Caste	32.0	7.5	0.2

Note: Quotient refers to the proportion obtained by dividing the percentage of share in Assembly by percentage of share in population. A Quotient of 1.0 indicates perfectly proportionate representation. Quotient of less than 1 means less than proportionate representation.

large number of them preferred voting for JD and its allies, a sizeable number of them even shifted their loyalty towards BJP and its allies. During 1998 elections witnessed a three-way division among the dalit voters. While vote for the Congress among the dalits went down from 19 per cent in 1996 to 13.7 per cent in 1998, the BJP and allies got almost similar support among the dalits during the last two Lok Sabha election. The JD and allies lost heavily among the dalits, and attracted only 28.4 per cent of their vote while the RJD got 23.5 per cent.

The BJP and allies have not been very popular among the illiterate voters who largely support the JD. But the survey indicates a shift among the illiterate voters towards the BJP and its alliance partner, the Samata Party. As compared to only 20.1 per cent of the illiterate voting for the BJP in 1995, as many as 33.2 per cent voted for the alliance. The JD and allies which got 47.3 per cent of their vote managed to get only 17 per cent vote from the illiterate voters. Nearly 18.6 per cent of them voted for the RJD during the 1998 Lok Sabha election. The past decade has also witnessed a loss of support for the Congress among the illiterate voters which has gone down from 19.8 per cent in 1995 to 15 per cent in 1998.

The BJP and allies have been a popular party among the educated voters. More than half of the educated voters opted for the alliance in 1998, as compared to 34.3 per cent of them in 1995. The increase of support among the educated for the BJP allies has been largely at the expense of of the Congress. The survey figures give clear testimony of this. The JD and allies have never been popular among the educated voters. The RJD has also managed to get some support from the educated voters.

CHANGING SOCIAL PROFILE OF ELECTED REPRESENTATIVES

The 1990s marked a sharp change in the politics of Bihar. Though the backward castes, which are numerically strong have occupied an important place in the state's electoral struggle, never before, except in 1977, were they able to guide its politics. At best, they have been able to play a secondary role in Bihar politics.

The implementation of a new reservation policy for the backward classes, based on the recommendations of the Mandal Commission report, witnessed strong opposition nationwide, by different upper-caste sections of society. Whereas in most parts of the country the backwards generally supported the policy, they nevertheless

remained mute onlookers to the violent opposition of this policy. In Bihar, by contrast, the backwards mobilised and put-up a stiff challenge to the anti-Mandal agitationists. This led to a prolonged and violent struggle on the streets between the anti-reservationists, mainly upper-caste youth, and the pro-reservationists comprising mainly of the backward-caste youth. The violent struggle between these two sections led to the externalisation of the undercurrent of age-old and deep-seated hatred between the forwards and backwards. Earlier, apart from a few instances, it was the forwards who generally dominated the backwards but this was a rare occasion when the divided backwards joined together to challenge the opposition of the Forward castes. One may blame the Mandal Commission of sowing the seeds of deep-seated casteism, but it also led to a consolidation of castes along only two axes, the forwards and the backwards, erasing for the time being, numerous internal differences between the two. Such social change was bound to find reflection on other aspects as well and its immediate fallout was on the nature of political representation in the state. Political representation in Bihar which had been typically upper caste dominated, started changing and more backwards came to the fore as people's representatives.

Over the years the social composition of the Bihar legislature has changed a great deal. There is a slow and steady decline in the representation of upper castes which has gone down to 17.1 per cent in 1995 as compared to 41.8 per cent in the 1967 Bihar assembly. The representation of the backwards had more or less remained the same till recently, ranging from 24.2 per cent in 1967 to 29.7 per cent in 1990.

The 1995 Vidhan Sabha election completely altered the nature of social composition of the assembly. In a sharply polarised situation not only did the representation of the backward castes go up to 45 per cent but the backwards for the first time outnumbered the upper castes in terms of political representation. The backwards who normally used to be fewer than the upper castes, are more than twice their number in the present Vidhan Sabha. The yadavs, who comprise about 11 per cent of the total population have a share of about 26 per cent of the seats in the Vidhan Sabha. The two other dominant backward castes, the kurmis and the koeris are also well represented in the house. Even if the representation of the upper castes has gone down significantly from earlier elections, except for the brahmins, the other upper castes like the rajputs, the

bhumihars and the kayasthas are well-represented. However, it is important to note that the low backward castes which comprise about 32 per cent of the population are still extremely under-represented.

The social composition of the representatives to the Lok Sabha from Bihar has also changed during the past few elections. The Lok Sabha election held during the post-Mandal period altered the social composition of the representatives. During the 1989 Lok Sabha election, 33.3 per cent representatives were upper caste – a figure which came down to 18.9 per cent in 1991, whereas the representation

TABLE 15: CASTE COMPOSITION OF BIHAR: LOK SABHA MEMBERS, 1996

Caste	Share in Population (Per Cent)	Share of Seats (Per Cent)	Quotient
Upper caste	13.0	27.7	2.1
Rajput	4.2	14.8	3.5
Brahmin	4.7	7.4	1.5
Bhumihar	2.9	3.7	1.2
Kayastha	1.2	1.8	1.5
Middle caste	19.3	35.0	1.8
Yadav	11.0	20.3	1.8
Kurmi	3.6	5.5	1.5
Koeri	4.1	5.5	1.3
Vaishya	0.6	3.7	6.1
Low backward caste	32.0	3.7	0.1
Muslim	14.8	7.4	0.5

Note: Quotient refers to the proportion obtained by dividing the percentage of share in Lok Sabha seats by percentage of share in population. A Quotient of 1.0 indicates perfectly proportionate representation. Quotient of less than 1 means less than proportionate representation.

TABLE 16: CASTE COMPOSITION OF BIHAR LOK SABHA MEMBERS, 1998

Caste	Share in Population (Per Cent)	Share of Seats (Per cent)	Quotient
Upper Caste	13.0	24.0	1.8
Rajput	4.2	11.1	2.6
Brahmin	4.7	5.5	1.1
Bhumihar	2.9	3.7	1.2
Kayastha	1.2	3.7	3.0
Middle Caste	19.3	20.0	1.0
Yadav	11.0	14.8	1.3
Kurmi	3.6	7.4	2.0
Koeri	4.1	7.4	1.8
Vaishya	0.6	5.5	9.2
Low Backward Caste	32.0	3.7	0.1
Muslim	14.8	11.1	0.7

Note: Quotient refers to the proportion obtained by dividing the percentage of share in Lok Sabha seats by percentage of share in population. A quotient of 1.0 indicates perfectly proportionate representation. Quotient of less than 1 means less than proportionate representation.

of backward castes went up to 43.1 per cent in 1991 as compared to 30.6 per cent in 1989. It was mainly possible because the backward castes were largely consolidated behind the Janata Dal. The 1996 Lok Sabha election was a unique one of its kind, held against the backdrop of an almost wash-out of the Congress from the political scene of Bihar. The upper castes in particular, were looking for a pillar to gather around and found in the BJP a natural locus. The Samata Party which draws support largely from the kurmis and koeris, and which unsuccessfully contested the 1995 Vidhan Sabha election, entered into an alliance with the BJP. So, in a sense the upper castes under the banner of BJP were putting up a challenge to the Janata Dal with the support of two backward castes, the kurmis and koeris. The division among the backward castes naturally has an adverse effect on their representation. The representation of the backward castes in the 1996 Lok Sabha election went down to 38.7 per cent as compared to 43.1 per cent in 1991. But, it is still higher than 27.7 per cent of the upper castes in the Lok Sabha from Bihar. The yadavs still have much higher representation as compared to their proportion in the population. The other backward castes like the kurmis and the koeris still have a 'proportionate representation'. The upper castes are also adequately represented as compared to their share of population. It is the lower backwards who normally bear the brunt of this intense competitive politics.

The 1998 Lok Sabha results further changed the social composition of the elected representatives. The election was held after Janata Dal had witnessed a split in the party and Laloo Yadav has formed his own regional outfit, the RJD. The division of votes of the backward castes had already started with the kurmis and the koeris moving towards the Samata in the 1996 Lok Sabha elections. This movement got a further fillip when some of the other backward castes deserted the Janata Dal and voted for the RJD. This election also marked the beginning of division in the yadav vote generally between the JD and the RJD. This was bound to be reflected in the number of representatives to be elected from various social groups. This witnessed decline in the representatives from the yadav caste from 20.3 per cent in 1996 to 14.8 per cent in 1998 Lok Sabha election. The success of the two backward castes the kurmis and the koeris – who sided with the Samata Party in 1996 Lok Sabha election – led to their further consolidation as a political

force. It naturally resulted in the increase in their representation from 5.5 per cent in 1996 to 7.4 per cent in 1998. The representation of the upper castes also declined marginally from 27.7 per cent in 1996 to 24 per cent in 1998. The clamour for the sizeable Muslim vote, which can make or mar the prospect for a party in various constituencies, resulted in sizeable increase in the number of Muslim contestants actually resulting in an increase in their representation.

The changing social composition of political representation is a clear indicator of the fact that backwards have come to play a major role in Bihar politics. Some may argue that the change in social composition of political representatives is largely due to the change in the party in power, and the recent results have demonstrated that parties may change hands in the share of the political power but it is hard to visualise a scenario in the days to come when the backwards would be denied their share in power. Unless the backwards get their share in political representation, no aspiring ruling party is going to get their support in return. The BJP which is visualised as a party of the upper caste, was successful in the 1996 Lok Sabha election winning 18 seats. But this was largely possible with the overwhelming support of the two backward castes, the kurmis and koeris. Even if representation of the backwards in 1996 Lok Sabha election went down to 37.1 per cent as compared to 43.1 per cent in 1991, it is still higher than the 27.7 per cent of

the upper castes. This phenomena is here to stay in Bihar politics in the days to come. The backwards have come to play a decisive role in Bihar politics but 'backwardism' may not be the nature of politics in the future. Assimilation of larger social groups may be attempted.

Notes

- 1 All the three surveys have been conducted by Centre for the Study of Developing Societies, Delhi during the 1995 Vidhan Sabha, 1996 Lok Sabha and 1998 Lok Sabha elections, respectively. The survey during 1995 Vidhan Sabha election was conducted in 16 assembly constituencies spread across all three regions of the state. Total number of completed interviews are 817.
- 2 The 1996 and 1998 surveys were conducted during the Lok Sabha election retaining the same set of sample. The survey was spread across 44 polling hoots of 22 Vidhan Sabha segments of 11 Lok Sabha constituencies selected through the Stratified Random Sampling adopting the Proability Proportionate to Size (PPS) method. Total number of completed interviews are 880 in 1996 and 833 in 1998.
- 3 During the 1995 Vidhan Sabha election the Janata Dal had an alliance with CPT and the CPM. The BJP and Samata Party contested election separately. For a meaningful comparison with the 1996 and 1998 elections both the parties have been looked as an alliance even for the 1995 Vidhan Sabha election.
- 4 During the 1991 Lok Sabha election the Jharkhand Mukti Morcha had an alliance with the JD, but the alliance broke down during subsequent elections.
- 5 During the 1998 Lok Sabha election the BJP and the JD maintained their alliance while the RJD entered into a half alliance with the Congress and also with the JMM.

General Elections 1996, 1998

Community Loyalties and Regional Outlook

Rajesh Dev

In its transition to modern representative democracy, the electoral agenda in Meghalaya is still largely determined by clan and kinship loyalties entrenched in majority tribal communities. As a result, besides various regional parties having a substantial presence in the electoral arena, even the national parties like the Congress and the BJP, have to fine tune their manifestos to suit regional aspirations.

The Object of our Deliberations is to promote the good purposes for which elections have been instituted, and to prevent their inconveniences.

— Edmund Burke

I Historical Background

MEGHALAYA carved out of Assam in 1972, sent its first representative to the Lok Sabha only in 1977. The state comprises three main tribal communities – the Garos, the Jaintias and the Khasis. The 'non-tribals' constitute only 14.5 per cent of the total population of 17,74,778. The state has witnessed seven elections for the two Lok Sabha seats since 1977, and six for the 60-member state legislature. The Khasis and the Jaintias inhabiting two contiguous hill areas and belonging to the Khasi-Pnar ethnic group are represented through 36 seats, while 24 seats in the legislature represent the Garos inhabiting another hilly area. In the Lok Sabha the two ethnic groups are represented by one seat each.

The main issue that has dominated elections in the north-east is the concern for identity. Meghalaya also registers this trend, in the sense that there is a sustained awareness about the effect of non-indigenous communities' influence on the social psyche of the indigenous communities and the impact on their fragile socio-economic fabric.

Another parameter that Chaube (1985) identifies as effectively deciding the course of electoral politics in the north-east is the weakness of the all-India parties in the hill areas. However, this is only partially true today, since parties like the Congress have a significant support base in the hill areas and other national parties like the BJP are slowly penetrating into these areas, although primarily it is the regional parties that have together decided the outcome of elections. Meghalaya is no exception to this rule and the regional parties, either jointly or in consort with the Congress figured in all

the post-election ties for governance. In other words, electoral politics in the north-east India reflects a clear intersection of regional variations with that of national election trends, in the sense that even those political parties characterised as 'national' like the Congress participate in the election process with identifiable regional issues and principles like 'preservation of tribal culture', 'preservation of local self-governing institutions and more rights for the indigenous communities in determining their destiny'. Sengupta (1997) has pointed out an interesting feature of the party system in Meghalaya. She says that in Meghalaya a national party like the Congress calls itself a national party with a regional outlook and regional parties such as the APHCL, call themselves a regional parties with a national outlook. The Congress has held the reins of government in Meghalaya for a longer period, sometimes with the support of independents and defectors, and sometimes in alliance with the opposition forum comprising the various regional parties.

There are numerous regional political parties in Meghalaya and there seems to be an increase in their number prior to every election, particularly assembly elections. The main regional parties in the state have been the APHCL, the HSPDP, the PDIC, the HPU, a breakaway group of the APHCL, recognised as a regional party in 1996, and the UDP formed during the 1998 elections through a merger of the HPU and some splinter regional parties. There have been various parties like the Hynniewtrep National Front in 1978, the Democratic Hills Movement in 1983, the Alliance for the Reconstruction of Meghalaya in 1988, the Youth Democratic Front in 1993 and the Peoples Democratic Movement (PDM) in 1998. Apart from the PDM, which won three seats in the assembly elections in 1998, all the others have failed to convince the electorate, faring poorly at the hustings [Government of Meghalaya 1978-1996].

II Sociological Background

Meghalaya, like some other 'tribal' north-eastern states, offers an interesting case for the study of problematic relationship of modern liberal multi-party democracy and a traditional society. The clan and kinship loyalties of the indigenous communities place effective restrictions on the free political participation and dialogue of the 'individual' with the framework of diverse institutional settings. In Meghalaya too, modern representative democracy has been adjusted with an existing 'tribal' society with non-liberal political values, in a way that is not free of tensions. The society lacks a central problem so far as political modernisation involves the transition of this traditional society into a modern liberal society. The crisis emerging from this fracture between tradition and modernity becomes clear from the fact that societal values are still stimulated by traditional mores and methods. However, there has been a change of character in the method of representation of these traditional values and mores in the process of their adjustment with the modern representative democracy. For instance, the traditional chiefs who, according to traditional norms, come from a particular clan, still determine the manner of an individual's participation and role in the affairs of the community, without any consideration for the individual's regard or disregard for the matter. In an era of representative democracy, the traditional social and political institutions survive however, as mentioned, with modifications and often in tension with the institutions of modern liberal democratic society.

The tribal chief or the local headman still remains the main link between the community and the outside world. Even today, permission of the local headman or the council of chiefs is necessary to conduct surveys which require inter-personal contact with individuals. This reflects the

limited amount of individual freedom that the society grants. Most headman of *darbaars* want the police to seek prior permission from them to even apprehend criminals. The presence of the state is rather weak in these communities except as a source of patronage. Hence the influence of these chiefs on electoral outcomes, mainly in rural areas can hardly be exaggerated. Further, the organisation of social bodies like that of students and others reflects exclusive insular bias along communitarian considerations.

In short, social relations in Meghalaya are guided clearly by a sense of clan and tribal necessities specially vis-a-vis the other groups and communities, and this is reflected in the preference for regional parties which stand for the preservation of 'indigenous ethnic identity'. The political process in the state seems to imitate similar patterns that caste and religion play in the electoral politics of India though here caste and religion are transplanted by ethnic considerations and questions of 'tribal-non-tribal' divide.

So far as the economy is concerned, it reflects the same contradictions with an added fact that there has been no formation of local 'bourgeoisie', though there has been a growth of a new set of people with increased access to capital. Again, because there is a tension in the way the economic structure is adjusted with the social relations that are mainly based on kinship, it does not stimulate any corresponding valuational changes that can help to consolidate a modern liberal democratic structure.

The society in Meghalaya is structured along matrilineal lines, and women, by virtue of this fact, are supposed to have a hold over the family. However, in reality, women play very little part in determining the symmetry of power or the actual decision-making process. This is evident also from the fact that very few women members have represented the people in the institutions of modern representative democracy. They play an insignificant part in the traditional political institutions also [Malngniang 1996].

Electoral outcomes and their trends in the hill states of north-eastern part of India have to be discussed and analysed in the backdrop of the prevailing insurgency in the region, though in Meghalaya insurgency is at a very nascent stage and its influence in determining electoral outcomes is still limited. Insurgents here do not overtly play any role in influencing the election mechanism, but unverified reports observing a tacit participation of insurgents in influencing electoral victories

are not uncommon (*India Today*, March 23, 1998).

The indifferent attitude of the insurgent groups in Meghalaya to competitive elections seemingly reflects that insurgency is merely an alternate form of radical political action and does not pose a threat to the integrative capacity of the federal state. Even the fact that the insurgents play a significant role and wield considerable influence in the post-election scenario – even in determining the character and nature of the new government emphasises this fact.

III Political Background

This background needs to be kept in mind while analysing the elections in Meghalaya. The Lok Sabha elections generally fail to evoke much enthusiasm among the electorate. There is very little competition among candidates for securing party tickets for the Lok Sabha. The electorate is more concerned with politics at the state level. In fact the CSDS data reveals that almost 61.2 per cent of the people are interested in the state governments only. Parliamentary elections have mainly been a sort of safety valve for candidates seeking a departure from state politics. At times candidates elected to parliament acquire national standing and they remain fixated to the parliamentary elections for instance, G G Swell and Purno Sangma.

Subrata Mitra's contention (1996) that the nature of the party system typically follows the complexity of social cleavages and a multi-party system is based on an effective linkage between social cleavages and political parties, does not seem to apply to the state. Meghalaya represents a typical case wherein social cleavages at a primary level are based mainly on ethnic considerations of 'tribe' and 'non-tribe', and though there exist other social cleavages based on age, literacy, gender and occupation, they are mainly of a secondary nature. There is also no cleavage in Meghalaya based on social 'class', because class formation process is at a very nascent stage even now.

The statehood movement spearheaded by the All Party Hills Leaders Conference (APHLC) ultimately secured a separate legislature, which was, for the dominant communities, the power to define their own destiny. However, very soon the process of defection was initiated and a major part of the APHLC joined the Indian National Congress in 1976.¹ This provided the Congress with its first foothold in the new state, which it steadily extended. The

other parties are regional and are breakaway factions of the parent APHLC. It may be contended without ambiguity that despite the presence of numerous parties, there is not much ideological difference among them. There also seems to be inter-party consensus, not on issues concerning development of the state, but on post-poll alignments for governance.

The Congress, which has always been a catchall party, has seen a slow decline in the percentage of its vote share in the Lok Sabha elections in Meghalaya. From a high of 74.3 per cent in 1980, the Congress climbed down to 53.6 per cent in 1996 [Government of Meghalaya 1978:1996], though there has been a steady increase in the turnout of voters. In fact there seems to be an inverse relationship between the Congress's decline and the regional parties' ascendancy. However, this has not effected much fluctuation in the vote-share ratio and the Congress has most of the times won both the Lok Sabha seats representing in the state. The Congress, by virtue of its being a national party has always been perceived as the recipient of the support of the non-tribal population and has been looked upon with distrust by a major section of the tribal population primarily in the hills of the Khasis and the Jaintias. This distrust, which is mutual, is also exhibited in the fact that membership in the regional parties is restricted mainly to people of the indigenous communities. It is not possible to assess the support of the tribal and the non-tribal population separately in the case of the parliamentary elections but it is rather clear that in the assembly elections the vote share received by the regional parties from constituencies having a predominant 'non-tribal' population is lower compared to that of the Congress. The participation or non-participation of the 'non-tribal' population in the affairs of the regional parties is strategic and definitive. Where they do participate, it is necessitated by strategic considerations. The emergence of 'ethnic enclaves' of tribal populations can be traced to the 'son of the soil' movement of 1979-80, when the indigenous communities on the basis of a perceived threat to their socio-economic and cultural fabric engaged in a relentless persecution of 'non-tribals' (*The Shillong Times*, November 1979).

However, the Congress, like any other regional political party, operated mainly on regional considerations as revealed in the election manifestos of the party [see Sengupta 1997]. This 'Nehruvian dualism' has helped the Congress in determining the destiny of all the governments that

have played a role in the governance of Meghalaya.

The regional parties play a crucial role in the elections of Meghalaya. Regional political parties that emerge during elections have always been crucial determinants in the formation and dissolution of governments in the state. The regional parties are termed as 'protest' parties more in a regional sense rather than an ideological sense. These parties not only seek to protect the indigenous 'tribal' culture, but also seek redistribution of authority within the existing federal framework. Some members of regional parties have from time to time vented popular reactions regarding review of the 'Instrument of Accession' signed by the Khasi and Jaintia states under the domination of India (*The Shillong Times*, July 1999).

The regional political parties are dominant mainly among in the Jaintia hills district, West Khasi hills district and pockets of East Khasi hills district. Their penetration in the Garo hills is minimal and restricted to one or two pockets and few candidates of regional parties are returned from the area. This has helped the Congress to balance the election results especially in the state legislature. This lack of support for the regional parties in the Garo hills is attributed to the absence of an educated elite who are responsible for leading any regional movement.² The social base of the regional parties is concentrated mainly among the illiterate and in rural areas, but their ideology has nothing to offer those masses. They use emotional slogans to build a support base. This indicates that mobilisation is mainly for the purpose of deriving benefits for the newly emerging elite. The issues highlighted are amorphous and do not promise any radical structural and institutional changes needed to change land relations, etc, that affect the common man [see election manifestos of various parties. Also see Sengupta 1997 for a review of these manifestos]. This seems to go along with their image as parties that cater to indigenous aspirations. Further, the traditional values based on 'tribal' customs and mores are more deeply entrenched in the rural area. Hence the support for the regional parties is not only natural but is also mutually reinforcing for both the community and the political parties.

Besides the Congress, no other national political party could make a dent in the electorate in elections, prior to the 1998 elections. The Left Parties had a very marginal influence and their support could never be translated into any significant contribution in terms of seats. The Left's

ineffectiveness is also due to their adherence and pursuance of a classical Marxist model, which seeks the presence of an organised working class as a ground for the initiation of class-consciousness. This coupled with the absence of 'exploited classes' in the classical Marxist sense and deeply entrenched religious sentiments among the local population undercut the space for the propagation of any variant of Left ideology [Sengupta 1988].

This decade however witnessed the entry of the BJP into the electoral politics of Meghalaya. This entry is significant primarily because the state has a majority of Christians and the BJP is perceived as a party of the Hindus. BJP's entry however is mainly in the constituencies having a majority of 'non-tribal' voters. The 1998 elections reflect the translation of their penetration into seats in the assembly and their capability to bargain in the formation of a non-Congress state government. It may appear that this marks the beginning of the religious communalisation of the electorate. However, the entry of religion in the electoral politics of Meghalaya had taken place as early as 1978 when a church elder had to be called into decide who shall be the chief minister (*The Shillong Times*, 1978).

Ideology has always occupied a back seat in the elections in Meghalaya. The prime concern for the electorate has been the personality of the candidates. The CSDS survey confirms the fact that 55 per cent of the respondents preferred to vote for the candidates, while 27.5 per cent for the party, and 16.9 per cent for the parties as well as their candidates. Moreover, personality, besides other things, encapsulates considerations like the clan, tribe, etc. That ideology plays little role in the elections in Meghalaya is borne out also by the fact that during the formation of governments in state legislatures, parties with diametrically opposed views come together to form the government. Election manifestos and election appeals released by various parties are almost similar in content and outlook (see election manifesto of the HPU, HSPDP, CPI, Congress). The divide between the parties seems to be more on their relative regional or national character, though as earlier mentioned, there seems to be no clear demarcation between the two, primarily because both operate on regional considerations.

IV

General Elections: 1996 and 1998

The 1996 Lok Sabha elections were held simultaneously with the state elections, but that made no fundamental

change in the prevailing trend. Competitiveness for nominations and in electioneering remained minimal in the state. In the Tura Lok Sabha seat, Purno Sangma has been elected continuously since 1977. It is only in the Shillong Lok Sabha constituency that some competitiveness can be viewed. There was no impact of the 'anti-incumbency' factor so far as Lok Sabha election was concerned, though it had a marginal impact on the outcome of the elections to the state assembly. Political principles based on economic priorities and social policies were considered peripheral concerns. Separate manifestos for the Lok Sabha elections were not issued by any party in the state, and national manifestos had very little to say about the state in particular. However, the parties or candidates concerned issued supplementary appeals. Even these appeals were either self-eulogies or traced the greatness of India and the arrival of the moment of truth regarding its tryst with destiny, and called upon fellow Meghalayans to gird themselves up [see G G Swell election appeal, 'My priorities', 1996]. These appeals were populist and amorphous and did not lay any concrete emphasis on economic priorities or social policies.

The 1996 elections took place on a subdued note due to the promulgation of the model code of conduct, implemented vigorously by the authorities. Posters and banners were modestly displayed and large public meetings were not held as before. In fact the post poll data generated by the CSDS as a part of the nation-wide survey reveals that 94.1 per cent of the people did not participate in any election meetings. Even participation of the people in election campaigns was very low: 98 per cent people did not participate in any campaigns. This showed that the code also found support among the people.

During the 1996 Lok Sabha elections the contest for the Shillong seat was mainly between G G Swell of the Meghalaya Federation, the regional parties' combine and D D Lapang of the Indian National Congress. The BJP candidate could only win in three assembly segments that had a predominant non-tribal population.³ In the Tura (Garo Hills) Lok Sabha seat, P A Sangma won, as usual with very little competition. For the Shillong Lok Sabha segment, out of the 6,81,660 voters only 3,85,045 exercised their franchise. This was 56.5 per cent of the total electorate. G G Swell secured 56.2 per cent of the votes and was declared elected. The Congress candidate secured only 35.2 per cent while the BJP and the CPI candidates

secured 6.4 and CPI 1.3 per cent respectively. The results, which highlight the assembly segments won by each candidate, validates the claim that the regional parties are strong in the Jaintia hills, west Khasi hills and parts of East Khasi hills, since their candidates won from almost all the assembly segments in these areas.

The 1996 Lok Sabha elections consolidated the rural support base of the regional parties and the Meghalaya Federation's candidate received immense support from the rural sector. Further the older people seem to be more favourably disposed towards the regional parties' candidate, while the younger generation is voting more for the Congress. This highlights that the upwardly mobile youth regard the Congress with favour and its portrayal as a 'national party with a regional outlook' provided these upwardly mobile youth with an opportunity to link themselves psychologically with mainland India and simultaneously remain satisfied that their 'unique identity' is maintained. The failure of the Congress to secure the victory of their candidate during the 1996 elections has been attributed to the lack of support for the Congress candidate from the party workers (*The Shillong Times*, 1996). This may partially be because the electorate held him responsible for the death of some youths in police firing during the 1992 riots when he had been the home minister. Consequently to the 1992 incident, he had also lost his assembly seat to a youth leader in 1994, which divided the loyalty of the electorate in his assembly segments and influenced the cadres.

The BJP won in three assembly segment with a non-tribal majority. The CPI, which has been the sole representative of the Left in Meghalaya, could not make any headway in any constituency.

As maintained earlier, political principles play very little part in determining the favour of the electorate towards political parties. Consequently, the electorate were presented manifestos that were identical and focused on similar issues. Topical issues relating to stability and efficient government, education, agriculture, health, water supply, etc., were highlighted. But none of the political parties talked of initiating fundamental structural or institutional changes in governance for bringing about a turn in the economy or in the deteriorating social relations between the tribals and the non-tribals. In fact, 76.5 per cent of the electorate are reconciled to the fact that their economic condition has remained the same and 64.7 per cent maintained

that the beneficiaries of 'development' have been the well-to-do.

The CSDS post-poll data emphasises that awareness of the people about the political institutions and political personalities, other than the immediate MP or MLA, is minimal. The data reveals that 90.2 per cent of the people surveyed were not aware of the name of prime minister and 66.7 per cent of the people surveyed gave an incorrect answer regarding the chief minister. This not only reflects a lack of political awareness among the electorate, but coupled with a high level of illiteracy (almost 50 per cent), it emphasises lack of political modernisation in the state in the last 12 years of its existence. The data also reveals that despite a low opinion of the political representatives, the voters exhibited trust in the institutions. The data provides some encouraging and positive responses regarding the need for institutions.

However, besides these grim reflections, the data shows that the people in this north-eastern state despite being fashioned through a traditional political culture are slowly legitimising the integrative process of multi-party democracy. They feel that political parties are an important vehicle for the articulation and aggregation of their interests. They feel themselves to be a part of the emerging liberal political process and emphasise that their vote has a part to play in determining their destiny. Of the survey respondents, 68.6 per cent agreed that their vote is important in the political affairs and of this, the youth are seen to be more emphatic, with 29.4 per cent of the youth between the age of 26 and 35 years expressing that their vote made an impact. This should be seen together with the fact that 72.5 per cent of the respondent also accorded legitimacy to the institutions.

However, the people as a whole feel more concerned with the issues that confront them on a day to day basis and are nearer home. They have very little empathy for national concerns and issues. Hence 92.2 per cent of the respondents reported that they were unaware of the Babri masjid demolition or the liberalisation process. Also, 88 per cent of the respondents maintained that they are not aware about the economic changes undertaken by the Rao government as part of liberalisation.

Further, the CSDS data confirms the view regarding Meghalaya that here region comes prior to the 'nation' as 98 per cent of the respondents regarded it to be so. The data also confirms our view that the people (60 per cent, according to the CSDS

data) feel close to the regional parties, and that these parties are better equipped to respond to indigenous aspirations.

The 1998 Lok Sabha election does not change much of the prevailing assumptions and follows similar trends. During the 1998 elections, the contest was mainly between the veteran leader G G Swell and the Congress candidate Ripple Kyndiah for the Shillong parliamentary constituency. The elections however saw an increase in the turnout. Out of 7,13,383 voters, 5,25,796 people voted. This is 73 per cent of the total electorate in Shillong. The Congress received 34.2 per cent with

TABLE 1: CLASSIFICATION OF VOTING PATTERN IN MEGHALAYA, 1998

Categories	INC	IND and Others
Age

TABLE 2: NUMBER OF SEATS AND PERCENTAGE OF VOTES SECURED BY PARTIES

Year	1996	1998
Total Seats	2	2
Turn-out	61.6	73.1
INC	seats 1 votes 53.6	seats 2 votes 47.6
CPI	seats - votes 1.4	seats - votes 1.4
BJP	seats - votes 9.1	seats - votes 9.0
HPU	seats - votes -	seats - votes -
HSPDP	seats - votes -	seats - votes 11.8
UDP	seats - votes -	seats - votes 18.2
IND/MF	seats 1 votes 35.8	seats - votes -
PDM	seats - votes -	seats - votes 9.5

the UDP trailing closely with 33.1 per cent of the votes. However, a significant aspect of the 1998 elections is that even parties that did not matter in the 1996 elections received a sizeable percentage of popular votes. For instance the HSPDP that had been contesting the Lok Sabha elections for a long time without making any impact on the electorate secured 11.8 per cent of the votes. Also, newcomers like the Peoples Democratic Movement (PDM) gained status of a regional party with its candidate covering 9.5 per cent of the votes. The CPI however further reduced its percentage to 0.7 per cent from an almost insignificant percentage of 1.4 per cent during 1996. The 1998 elections also saw a reduction in the vote percentage of the BJP from 9.1 per cent in 1996 to 6.4 per cent in 1998. The party was mainly restricted to the three non-tribal assembly segments, where it secured more than the Congress and the UDP candidates (*Election Handbook*, 1998).

The Turaparliamentary constituency saw the same trend of overwhelming support for Purno Sangma who secured 65.6 per cent of votes. The BJP candidate received 12.5 per cent votes and came second. The UDP, CPI and the Garo National Council candidates secured 12, 2.5 and 4.9 per cent of votes respectively. As mentioned earlier, the results for the Lok Sabha seat was a forgone conclusion in favour of Purno Sangma, with no possibility of any strong opposition. This reinforces the earlier claim that personalities matter more in the elections of Meghalaya.

The CSDS data show that there was not much change in the social base of the political parties. The regional parties maintained their rural outlook and drew their support from the illiterate rural artisans and cultivators and a sizeable section of the women (62.5 per cent). The parties also received 87.5 per cent of their support from the Christians. The Congress maintained its support among the youths with 75 per cent of them supporting the party.

As always, the 1998 elections did not see a contest between the parties on the basis of consistent ideologies or political principles. However, topical issues like that of the Supreme Court order banning timber trade was an order that many candidates promised to reverse. This found favour with the electorate since the entire rural economy centres on timber trade. But it cannot be said for certain which party derived maximum benefit from the promise, since all professed to remove this ban for the state.

In conclusion, we can say that despite the fact that we see a definite trend towards

the consolidation of liberal democratic politics, occasional violent outbursts on the tribal-non-tribal question reverses the processes of articulation of interests and aspirations on the basis of democratic norms. The hold of the traditional political institutions and their conflicting claims to power vis-a-vis the state emphasises the divided loyalty of the people who are caught in a transitory phase between entrenched, insular communal interests and one that provides the individual with a greater sense of participation with autonomy. Despite claims to the contrary, persons drawn from certain chosen clans maintain the traditional political institutions and it is from among them that the local chief, the *syiem* and the functionaries are drawn. The individual has very little participation in the actual decision-making processes of these institutions. Further, despite its matrilineal social structure, the society through its values and norms makes the participation of the women in the affairs of the society virtually impossible. The closed character of the society is also reflected in the fact that the women are given more significance only in running the affairs of the family. However, as investigations reveal women are becoming more and more aware of their rights and seek participation in the actual decision making process.

It can be said that despite the existence of grey areas in the actual working of multi-party democracy in Meghalaya, liberal democratic politics is an inevitable

necessity. Traditional institutions can be reformulated to acquire characteristics that reflect greater democratisation and may be modelled on other institutions like the 'panchayats' found in other parts of the country, but functioning essentially on the basis of a liberal democratic political system.

Notes

- 1 The APHLC and the Congress merged with the Congress at the Mendipather Session in 1976
- 2 For a discussion on the relationship between the emerging educated middle class and the articulation of ethnic and regional issues, see Apurba Baruah (1994:242-77).
- 3 These constituencies are Pynthor, Mawprem and Laban, which has a predominant non-tribal community

	b) General provision - refer note 2	3.40	Nil

8) Previous year's figures have been regrouped wherever necessary.

General:

2 Investments:

- a) All investments are treated as Current Investments.
- h) Broken period interest and costs such as brokerage, commission, etc. incurred on acquisition of investments are treated as revenue.
- c) Valuation.
 - (i) Bonds and Government Securities are valued in aggregate for each category at lower of cost and market value at the balance sheet date in accordance with the guidelines of RBI. In respect of unquoted investments, the value based on YTM valuation as per RBI guidelines are adopted as market value.
 - (ii) Preference and Equity Shares which are unquoted or where current quotations are not available, are valued at the break-up value worked out based on the latest available Balance Sheet of the investee companies.
 - (iii) Unquoted Debentures are valued as though they are advances.
 - (iv) Treasury Bills and Commercial Paper are valued at acquisition cost.

3. Advances:

- a) Advances are stated net of provisions and have been classified into standard, sub-standard, doubtful and loss assets as per guidelines of RBI.
- b) Provision for sub-standard, doubtful and loss assets is made in respect of identified advances in conformity with guidelines of RBI.

4 Fixed Assets:

- a) Fixed Assets are accounted for on historical cost basis.
- b) Depreciation is provided for on straight-line basis as under:
 - i) Computer Equipment used for running the banking software at the rate of 33.33% per annum.
 - ii) Certain furniture and fittings at the rate of 20% per annum.
 - iii) Other assets including assets given on lease as per rates prescribed under Schedule XIV to the Companies Act, 1956.

5 **Transactions Involving Foreign Exchange:**

- Foreign Currency Assets and Liabilities are translated at exchange rates as advised by Foreign Exchange Dealers Association of India (FEDAI) and RBI guidelines. The resulting gain or loss on revaluation is recognised in the revenue account.
- Acceptances, Endorsements and other obligations are carried at the exchange rate prevalent on the date of commitment.
- Contingent liabilities on account of outstanding foreign exchange contracts are reported at the contract rates. These contracts have been revalued on the Balance Sheet date at the rates notified by FEDAI and the resulting profits or losses are accounted for in the Profit & Loss Account.
- Income and expenditure items are accounted for at the rates ruling on the date of the transaction

TIMESBANK

The Convenience Bank

Regd Office. 5-R/2 Badshah Khan Chowk, N.I.T., Faridabad - 121 001

6. Revenue Recognition:

- a) Revenue and expenses are accounted for on accrual basis except:
 - i) Income on Non-performing Assets which is recognised on realisation.
 - ii) Commission which is normally recognised on the date of receipt although income may relate to a period extending beyond the date of financial statements except commission on guarantees issued for periods beyond a year which are amortised equitably over the number of years for which the guarantees are valid.
- b) The amount of Lease Equalisation representing the difference between the annual lease charge and the depreciation provided on leased assets is adjusted with the lease rental income in the Profit & Loss Account with corresponding adjustment to the value of assets given on lease through the lease adjustment account. The annual lease charge represents the recovery of net investment in the asset computed on the basis of interest rate implicit in the lease
- c) In respect of discounted money market instruments such as Treasury Bills, Commercial Papers, Zero Coupon Bonds etc the difference between acquisition cost and redemption value is accrued as income on a constant yield basis

7. Staff Retirement Benefits:

Provision for Gratuity and Leave Encashment have been made based on actuarial valuation and provision for Super-annuation has been made on accrual basis.

8. Deferred Revenue:

The following have been treated as Deferred Revenue expenditure and written off over a period as indicated below

- a) Preliminary expenditure - written off over a 10 year period
- b) Software licence fee paid - written off over a 7 year period
- c) Expenses incurred on branches prior to commencement of business-written off over a 3 year period

Auditors' Report on the Accounts of Times Bank Limited under Section 30 of the Banking Regulation Act, 1949.

1. We have audited the attached Balance Sheet as at 31st March, 1999 of Times Bank Limited and also the annexed Profit and Loss Account of the Bank for the year ended on that date.
2. The Balance Sheet and the Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 read with the provisions of Section 211 of the Companies Act, 1956.
3. We report that:
 - a) We have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purpose of our audit and found them to be satisfactory.
 - b) The transactions which have come to our notice, have been, in our opinion, within the powers of the Bank.
 - c) In our opinion, proper books of accounts as required by law have been kept by the Bank so far as appears from our examination of those books.
 - d) The Balance Sheet and Profit and Loss Account of the Bank dealt with by this report, are in agreement with the books of account.
 - e) In our opinion the Balance Sheet and the Profit and Loss Account dealt with by this report, comply with the Accounting Standards referred to in Sub section (3C) of Section 211 of the Companies Act, 1956 in so far as they apply to Banks.
 - f) In our opinion and to the best of our information and according to the explanations given to us, the said accounts read together with the notes thereon and the Significant Accounting Policies, give the information required by the Companies Act, 1956 in the manner so required for Banking Companies and on such basis, the said Balance Sheet gives a true and fair view of the state of affairs of the Bank as at 31st March, 1999, and the Profit and Loss Account shows a true and fair view of the Profit of the Bank for the year ended on that date.

Fractured Identities

Politics in a Multi-Ethnic State

A K Baruah
Sandhya Goswami

Unlike most other Indian states where regionalism is being articulated in terms of one dominant cultural community, in Assam a number of smaller ethnic communities are beginning carve out areas of influence through their respective parties. While the Asom Gana Parishad representing 'Asomiya' interest has begun to have a presence in the non-Assamese speaking areas which had been Congress strongholds, regional issues have dominated the elections in the Bodo and Karbi areas. None of the national parties including the BJP which has registered an impressive growth, have been able to present an effective challenge to these regional forces.

ELECTORAL politics in Assam during the last one decade, beginning 1985, reflects the emergence of a new trend. The one-party dominant system is giving way to a multi-party system in which political parties of various ethnic groups or smaller cultural communities play significant roles. The support base of the Congress Party shows a remarkable decline while a regional party – the Asom Gana Parishad, has been able to consolidate its hold in Assam politics. A number of smaller parties articulating the interests of smaller ethnic communities and religious and linguistic minorities, have also been making their presence felt. The left parties remain where they were, except for their tacit acceptance of the growing prowess of regional forces. The decade also shows the emergence of Bharatiya Janata Party as an important electoral force. Electoral politics in Assam is gradually reflecting the political significance of its multi-ethnic reality, with the respective educated elites of various communities consolidating their hold over the politics of their own communities.

Since 1952, except for the 1978 and 1985 assembly elections and its debacle in the 1996 elections, the Congress has been winning all the parliamentary and assembly elections in the state (Tables 1, 2 and 3). In 1977, when in the rest of India, the voters were punishing the Congress Party of Indira Gandhi for the atrocities committed during the Emergency, the electorate in Assam gave the party 10 out of 14 seats in the parliament with 50.6 per cent vote share. Its share of votes in the parliament elections, up to that period, remained above 45 per cent and in the assembly elections, its lowest vote share during this period was 43.5 per cent (Table 1). Its first major setback came in the assembly elections of 1978 (Table 2), in which it won only eight seats in an assembly of 126 and polled 23.7 per cent of the valid votes. But these elections were

held after the Janata Party's ascent to power at the centre. That the change of government in the centre, leading to corresponding changes in the political alignment in the state, had affected the results of these elections became clear from the fact that the same issue of Emergency excesses remained central to the campaigns of both the 1977 parliamentary and 1978 assembly elections and yet led to very different results. In the assembly elections of 1985, when the Asom Gana Parishad (AGP) rode on a wave to power, as a result of the now famous 'Assam Movement' on the foreigners' issue, with 63 seats in a house of 126 and polled 34.54 per cent votes, the Congress won 25 seats and polled only 23.47 per cent votes. It is true that during this election the pro-Assamese nationalist votes remained solidly behind the AGP but the votes of the forces inimical to the movement got divided, with the United Minority Front (UMF) capturing 17 seats and collecting 10.85 per cent votes. The left parties put up a remarkable performance during the post-Emergency Assembly election of 1978 with the CPI(M) winning 11 seats and the CPI five seats. The Revolutionary Communist Party of India (RCPI) too won four seats in that election. But in 1985, primarily because of their anti-Assam movement stand, they were almost wiped out. The CPI could not

win any seat and the CPI(M) won only two. The Plains Tribal Council of Assam (PTCA) won three seats in Bodo areas and United Tribal Liberation Front (UTNLF), another tribal party, won a single seat. The Congress(S) won four seats.

RISE OF ASOMIYA NATIONALISM: ELECTORAL PERFORMANCES

In the 1991 assembly elections the Congress staged a remarkable comeback by winning 65 seats and polling 29 per cent votes. The Natun Asom Gana Parishad (NAGP), a breakaway faction of the AGP, won five seats with 5.5 per cent votes. The CPI(M) won two and CPI four seats in these elections. Among the parties representing ethnic minorities, the newly formed Autonomous State Demand Committee (ASDC) of Karbi Anglong won four assembly seats with 1.6 per cent votes. Other such parties drew a blank. The BJP, which was never before a significant force, won 10 seats and polled 6.4 per cent votes. A quick look at these results shows that the main reasons for the Congress victory, despite poor vote share, were the division of the pro-Assamese nationalist votes between the AGP and NAGP and the unprecedented performance of the BJP. While the AGP and the NAGP together polled 23.6 per cent, the BJP's 6.4 per cent votes in 47 constituencies spread all over

Note: Remaining seats and vote have gone to either other minor parties or independents.

* Election held only for two Lok Sabha seats in 1980.

the state must have cut into the vote share of the non-Congress forces. Therefore, the seats won by the Congress in 1991 need not necessarily mean an improvement in its support base. The decline that started in 1977 continued despite its being able to form a government in the state. Moreover, an analysis of the constituencywise performance of the Congress Party shows that, in this election, Congress performance was much better in the areas dominated by the non-Assamese speaking population. Out of the 65 seats it won, at least 40 were constituencies where 'Ana-Asomiya', 'Na-Asomiya'¹ or the tea garden labour population was electorally significant.

At the parliamentary level, in 1985, the Congress won four seats out of a total of 14 with 23.5 per cent votes and in 1991, it won eight seats with 28.5 per cent votes. The AGP won a single seat with 17.6 votes. The NAGP could not win any seat but polled a significant 5.9 per cent votes. Like its performance in the assembly elections, in the parliamentary elections too, the BJP won two seats with 9.6 per cent votes. The scenario thus was not much different from the assembly elections.

In the parliamentary elections of 1991, the Congress fared better in the areas dominated by tea garden labour and Na-Asomiyas. In the Asomiya areas it could win where it did, only because of a split in the Asomiya nationalist vote between the AGP and NAGP. In Dhubri which has a large immigrant population the Congress polled 26.5 per cent votes while the AGP and NAGP polled 7.4 per cent and 2.4 per cent respectively. The BJP, which was in the second position, polled a significant 19.6 per cent. The Congress thus had a comfortable margin. In Jorhat, with a significant presence of tea garden labour, the Congress polled 44.9 per cent while the AGP and NAGP polled 24.1 per cent and 6.9 per cent only, respectively. The Congress had a margin of almost 20 per cent over the AGP and of almost 11 per cent over AGP and NAGP put together. In another similar constituency Dibrugarh, the Congress polled 50.5 per cent, AGP

in the second place polled just 22 per cent and NAGP came a poor third with 7.3 per cent. The Congress again had a margin of over 30 per cent. In Kaliabor, the Congress had a margin of about 10 per cent over AGP and NAGP. It polled 45.6 per cent, AGP 26.3 per cent and NAGP 9.3 per cent. In the Lakhimpur constituency, Congress got 31.4 per cent, AGP could manage 21.1 per cent and NAGP polled 1.9 per cent thus giving it an edge over 7 per cent. In Tezpur, with a sizeable Nepali and tea labour population, the Congress polled 41.9 per cent while the AGP polled 23.2 per cent and the NAGP polled 10.9 per cent. The Congress had about 7 per cent advantage over the two regional parties. But in constituencies like Mangaldoi and Guwahati, where this factor was insignificant, it could not show similar strength. In Mangaldoi, it polled 24 per cent, the AGP 21.4 per cent and the NAGP 12.3 per cent. The two regional parties together polled about 9 per cent more than the Congress. In Guwahati, the Congress polled 23.8 per cent, NAGP 17.5 per cent and AGP polled 16.6 per cent. The AGP and NAGP together polled 34.1 per cent.

10.3 per cent more than the Congress. Nowgong was the only constituency where this pattern did not emerge. Despite the presence of sizeable immigrant population, the AGP won the seat with 24.4 per cent vote. The NAGP polled 3 per cent and the Congress polled just 22.3 per cent. It is therefore clear that even at the parliamentary-level election the Congress was experiencing an erosion of its support base and the regional forces were gaining ground over it. Electoral politics of the state was thus becoming a sphere where Asomiya nationalist forces and the parties representing the interests of the smaller ethnic groups were beginning to challenge the Congress, the most dominant national party. An understanding of the Congress' decline is necessary for understanding the regional and ethnic forces' ascendancy.

CONGRESS DECLINE: HISTORICAL BACKGROUND

It is well known that, during the period of its inception in Assam, the Congress was thriving on the support of the Asomiya middle class and its predecessor, the newly emerging educated elite of the British days.

Note: Remaining seats and vote have gone to either other minor parties or the independents.

In the pre-independence period, all its leaders were from the newly emerging western educated elite which took the shape of a middle class by the last decade of the 19th century.² H K Barpujari has pointed out that representatives from Assam had attended the early sessions of the Congress, including the first meeting that preceded its foundation. Barpujari also provides us with names of some of these representatives. Prominent among them were Debicharan Baruah, Gopinath Bordoloi, Kalikanta Barkakti, Satyanath Borah. All these gentlemen participated in the second session of the Congress. Radhanath Changkakoti and Laksmikanta Barkakoti attended the third session.³ A look at the names of the delegates from the Brahmaputra Valley to National Congress sessions from 1886 to 1921 shows that most of them belonged either to the middle class or its predecessor the western educated elite [Guha 1977: App 6, 343-45].

In the Assamese dominated areas of this valley, because of the influence of this elite, the Congress became its 'spokesperson' and generally articulated and tried to protect its interests by advocating the idea of an 'Assamese nationality'. This was reflected in the election promises of 1946 itself. A Congress election leaflet declared,

Unless the province of Assam be organised on the basis of the Assamese language and Assamese culture, the survival of the Assamese nationality and culture will become impossible. The inclusion of Bengali-speaking Sylhet and Cachar (plains portion) and the immigration and importation of lakhs of Bengali settlers on wastelands has been threatening to destroy the distinctness of Assam and has, in practice cause many disorders in its administration. For appropriate solution and redress of this big problem, the Congress Party should be installed as the majority party in the assembly [cited by Amalendu Guha 1977, pp 302-03].

It is interesting to note that on the basis of such appeals the Congress polled 48 per cent votes in those elections. More importantly it polled 78.3 per cent in the general constituencies [See Guha Appendix 14A]. Such a pro-Assamese nationalist policy could be followed by the Congress in that period without much opposition primarily because the Surma valley in those days was not a part of Assam Congress. It was a part of the Bengal Congress. The immigrant population though substantial⁴ was politically not well organised and the Assamese speaking population held sway over the politics of the state. The communities like the Bodo-, Mishings and Karbis were yet

to assert their identity. The Nagas had been demanding independence but the Khasi-Jaintias, Garos and Mizos were only beginning to understand parliamentary democracy. The Congress could therefore concentrate on winning the Assamese over. The party could do that rather easily by raising the issue of national identity of the Assamese because by that time the Assamese middle class, for whom this issue was important, had ascended to hegemony [See Manorama Sharma]. The proof of the Assamese middle classes' obsession with national identity is not difficult to find. Even in its nascent phase itself some leaders of this class had told the Congress that they would become ardent supporters of the Congress provided it took measures to protect the Assamese national identity [Baruah 1994]. It was therefore natural for the Congress to promise protection of this identity defined in terms of Assamese language and culture, and thus to create a support base among the Asomiyas.

But after independence its support structure underwent a change. Or rather it was forced to redefine its support base. A major Bengali-speaking area, namely Barak Valley, was now brought under its jurisdiction. The Bengali population of both the valleys put together, became electorally significant for Assam Congress. The Asomiyas and the Assamese Bengalis became the two most numerous linguistic groups of post-independence Assam. Right from the pre-British days, the elites of these two linguistic communities had been vying with each other for dominance over the land mass now known as Assam. Ever since 1846, when Bengali was given the status of the language of Court and schools, the Asomiya elite had become apprehensive of the intentions of the Bengali residents of Assam. While the chauvinist section of the Asomiya middle class kept accusing all Bengali residents of Assam of expansionism, the chauvinist section of the Bengali residents of Assam and their patrons in Bengal openly expressed their desire to reduce the Asomiyas to a subjugated community in their own homeland [Baruah 1990]. In such a situation, the Congress' earlier policy of standing for the protection of the Asomiya interest became inadvisable. With the continuous influx of refugees from the erstwhile East Pakistan and with more and more tribal communities like the Khasis, Garos, Bodos trying to assert their own identities, the situation was becoming increasingly complicated. The Asomiya middle class, in the meantime, was becoming more aggressive. As is evident from the policies pursued

by the Congress on issues like official language, medium of instruction, and establishment of refineries, the Assam Pradesh Congress was trying to do some tight rope walking. But the central leadership of the party appeared to be insensitive to the problems of the state.

This insensitivity was becoming more and more pronounced. The Congress' attitudes towards the demands of the various groups like the hill tribes and the Bodos showed elements of uncertainty. For instance, when the Bodos demanded introduction of Bodo as the medium of instruction up to the secondary level in the then Goalpara district in 1968, the then chief minister stated it to be contradictory to the government's educational policy.⁵ The demand of a separate state made by the hill tribes like the Khasis, the Jaintias, and the Garos, which was articulated by the APHLC, too did not receive a sympathetic response in the beginning. In fact, the APHLC legislators resigned en-block from the Assam assembly, soon after the 1967 assembly elections, in order to pressurise the central government for the formation of a separate hill state. It is true that on the eve of elections the Congress always takes steps to gain popularity and tries to undo the damages caused by its policies. For instance, on the issues of the establishment of a second oil refinery in Assam and the demand of a separate hill state, the Assam Congress took courses of actions which actually alienated the large sections of the population who were supporting these demands and then tried to salvage the situation by announcing measures to placate these sections just before the elections (see note 5). Till the late sixties and early seventies the Asomiya middle class was still controlling the affairs of the state through the Congress Party and therefore such attitudes could be interpreted as the attitudes of the Asomiya middle class. Of course, there were tussles for leadership within the party leading to factional politics which contributed to the erosion of its support structure. But these conflicts could not remain unaffected by the overall 'communal' rivalries (see note 5).

It is interesting to note that during the post-independence period when the Congress Party was losing its original support base for the reasons discussed above, some regional political groups and parties were emerging in Assam. Some of these, like the All Party Hill Leaders Conference (APHLC) with non-Assamese speaking ethnic support base, began to do fairly well but the regional groups formed in the Asomiya areas like the Peoples Democratic

Party and the Ujani Assam Rajya Parishad, could not make any mark in the electoral politics of the state.⁶ It was only after the six-year long Assam agitation that regional forces in the Asomiya areas could become significant in the electoral arena. It was under such circumstances that the compulsions of parliamentary politics seemed to have forced the Congress to concentrate on the most organised and insecure sections of the society in Assam – the tea garden labourers and the immigrant population. As K M Deka shows, the rural Muslims and the tea garden labour voters had a tendency of voting *en bloc* for the Congress. Assam has a large tea garden labour population and the only trade union organisation which has been able to penetrate this section in Assam is the Indian National Trade Union Congress (INTUC). The Muslim immigrants have always been insecure particularly in view of the aggressive posture of the Asomiya middle class. But they were also becoming more and more relevant in electoral terms because of their increasing number.⁷ As we have shown above the election results of 1991 shows that the support base of the Congress has changed over the years and it has come to depend on the immigrants, tea garden labour and other Ana-Asomiya sections. Some deliberations in the Assam Pradesh Congress Committee show that the Congress has been concerned about its hold over these sections.⁸

ISSUES IN 1996 ELECTIONS

By the time Assam went to the polls in 1996, both for the parliament and the assembly, the Congress found itself in a very difficult situation not only because of the alienation of a large section of Asomiyas but also because of the fact that the AGP and NAGP were united. The other opposition parties including the left parties and even UMF – a party which had been claiming to represent the interests of the religious and linguistic minorities – joined hands with other regional forces particularly in view of the unprecedented corruption and indiscriminate use of the repressive state machinery by the Hiteswar Saikia government. The situation was further complicated by the problem of extremist politics of organisations like the United Liberation Front of Asom (ULFA) and Bodo Security Force (BDSF). In early 1995, most observers would have agreed that the next elections would be fought on the issues of corruption and violation of democratic rights.⁹ It was under such circumstances that the Congress tried to change the focus of politics to an issue which could give it an advantage over

others. In a clever move, Saikia sought to change the political discourse so that the issues of corruption and violation of democratic rights would recede to the background on the election eve. He tried to create conditions which would ensure that the issue of ethnic identities in this multi-ethnic state gained vital importance in electoral politics. The articulate sections of the Bodos, the Karbis and the Mishings have been trying to mobilise 'their' people on ethnic line. The Bodos and the Karbis had already been demanding political autonomy and their movements, like many such others, had acquired an anti-government character. Saikia was quick to realise that in a multi-ethnic state, if more tribal communities took to such movements his party, with its high command generally viewing regional and ethnic aspiration as inimical to 'national integration', would become increasingly unpopular. The experiences of the Assam agitation in the late seventies were too recent to be forgotten. He therefore, declared that his government would grant autonomy to all tribal communities. This move was directed at mobilising near total tribal support for his party. But two factors created serious problems for this strategy.

One, the Congress' track record in keeping its word has been rather poor in Assam. The Assam Accord and the Bodo Accord remain only partly implemented. Tribal communities like the Lalungs, Rabhas, Mishings and the Bodos do not live in distinct areas where they are in a majority and therefore their autonomy would be without any defined territories. These factors made Saikia's promise appear empty. Some sections of these tribals, particularly some sections of their elites, realised this and the communities got divided. The anti-accord groups became so strong in communities like the Lalungs and the Mishings that in certain cases those leaders who supported the accords or signed such accords were not allowed to go back to their areas. Another attempt at winning over some ethnic communities was the policy of granting scheduled tribe status to some of the communities who had been demanding such status. The Congress government's decision to grant ST status to the Koch Rajbongshis also ran in to trouble because some ST communities were opposed to such a move. A Tribal Student Federation in fact filed a case in the Guwahati High Court against the decision to grant ST status to Koch Rajbongshis (*Pratidin* Assamese daily, February 1996). There is reason to believe that besides the attempts to win over support of the tribals, the desire to replace

corruption and violation of democratic rights as the major issues for the elections must have been an added consideration that might have influenced Congress' strategy of focusing on ethnic issues. Asom Gana Parishad, the main opposition party in Assam can remain a formidable force only if the Asomiya community could remain the single largest community in the Brahmaputra Valley. But if the communities traditionally considered to be parts of Asomiya culture, like the Lalungs, Rabhas, Mishings, Koch Rajbongshis and even Ahoms, begin to distinguish themselves from the Asomiya identity then the AGP will have to be content with being a party of the small Asomiya community comprising the caste Hindu Assamese, and maybe, a small section of the Assamese speaking Muslims of Upper Assam. But the Congress game plan failed primarily because of the lack of credibility of the party and its leadership and the united opposition's ability to keep the focus on corruption and violation of democratic rights. Organisations like the Committee for the Protection of Freedom of Expression (CPEE) and the Ganatantrik Adhikar Surakhya Samiti (GASS) formed by influential sections of the press, intellectuals and the non-Congress parties played an important role. The anti-Congress and pro-opposition line taken by the extremists too seems to have created problems for Congress.

That state repression, corruption and ethnic identity remained crucial issues for the election becomes clear from the fact that almost all manifestos of the major non-Congress parties focussed on these issues. The AGP manifesto promised to bring an end to maladministration and corruption. Autonomy and the problems of the tribal people of Assam are the other two issues which they promised to solve if they came to power. The AGP manifesto also declared that the Constitution needed to be amended to grant autonomy to the states. The manifesto deplored the misuse of the army to repress ordinary people. The manifesto promises a series of steps for the general development of the state. The CPI(M) manifesto is more articulate in this context. In a section called 'The Situation in Assam', it accuses the Congress government of letting loose a reign of terror in the name of controlling extremists. It also accuses the Saikia government of sowing seeds of conflict among the Rabha, Tiwa and Mishing people in the name of granting autonomy. It identifies the government as the instrument of massive corruption. The CPI too identifies corruption, repression and problems of

nationalities as major issues. The BJP too includes a section called 'Administration' in its manifesto, in which corruption and violation of democratic rights were highlighted. The problems of tribals and other backward sections also figure in the manifesto. Even a small party PDF, representing Bodo ethnic identity, blames the Saikia ministry of corruption, atrocities and of complicating ethnic problems. It is interesting to note that except the BJP, none of the parties including the AGP, really harped on the issue of the detection and deportation of 'foreigners' though most of them insisted that immigration from Bangladesh should be stopped. BJP was the only party which advocated the pre-1985 AGP line. But this issue never really took off because its main vehicle, the AGP, decided to play it down, particularly because of the alliances it had to form to keep the non-Congress votes together. Saikia's attempt at diverting the attention of the electorate from these issues by playing ethnic politics [see Barua] in fact boomeranged leading to divisions among communities like the Rabhas, Lalungs and Mishings and alienation of a large number of tribals from the Congress Party. Even BPP(P), its ally in the Bodo areas could not keep the focus on issues Saikia chose. The ethnic issue in fact remained live in the Bodo and Karbi areas but was monopolised by the anti-Congress UDF and ASDC.

ALLIANCES

Newspaper reports, particularly in the regional press, beginning from 1994 show that the non-Congress forces in Assam were getting together, initially on the issue of state repression. In mid-1994 itself Hiteswar Saikia's government was using the police and military forces to deal not only with the extremist elements but also more generally, with forces which were anti-government. Journalists who reported the atrocities and those who began criticising the corrupt practices of the government were becoming its targets. It was alleged that even political leaders at the village, town and district levels, who were considered troublesome, were being picked up by the police and the security forces. The Terrorist and Disruptive Act (TADA) was being used almost indiscriminately to silence dissent. A section of journalists took the initiative and formed an organisation called the Bak Swadhinata Surakhya Samity or the Committee for the Protection of the Freedom of Expression (CPFE). This Committee was formed mainly by journalists but a large number of leaders of non-Congress political parties

participated in this mobilisation. At the initiative of journalists and some leading intellectuals, a political platform called Ganatantrik Adhikar Sangram Samiti (GASS) was formed on September 6, 1994 (see Resolution the State Convention September 6-7, 1994) at Guwahati. This organisation made its political position clear through a statement, issued in its first state convention, which highlighted the corrupt practices of the government, state repression, and also took clear positions on most of the live issues of politics in the state. It demanded protection of human rights, decentralisation of political power, withdrawal of anti-people acts, implementation of the Assam accord and deportation of foreign immigrants with March 25, 1971 as the cut-off date, implementation of the Bodo accord and wanted steps for protection of the tribal people. It wanted the creation of an environment conducive to negotiations with the ULFA and the BDSF. It demanded release of all journalists detained under TADA. It further demanded that the natural resources of Assam be utilised in the interest of the residents of Assam. It opposed GATT and demanded measures to solve the economic problems of the people of the state. This platform received support from powerful student bodies like the All Assam Student Union (AASU) and the All Bodo Student Union (ABSU). The GASS ultimately took formal shape and contested municipal elections in Guwahati city. Though its electoral performance was poor, it made it possible for the non-Congress forces except BJP and small leftist parties like the SUCI and CPI(ML) to come together. The AGP and all major non-Congress political forces moved towards an understanding. This understanding culminated in an alliance of the five major parties – the AGP, the CPI, the CPI(M), the Autonomous State Demand Committee (ASDC) and the Bodo Peoples Party (Sangsuma) [BPP(S)]. There were efforts to bring the Janata Dal and the United Minorities Front (UMF) also into the front. In the meantime the National Democratic Front, a banned organisation of Bodos, directed the Bodo political parties to unite so that the anti-Congress Bodo votes do not get divided. As a result, in the Bodo dominated areas, the BPP(S), the Plains Tribal Council of Assam (PTCA) and the United Democratic Front (UDF) decided to come together. The Bodo People's Party (Premising) [BPP(P)] however, remained with the Congress. The United People's Party of Assam (UPPA), a party representing minority interests, too arrived at an understanding with the AGP. In the pre-

election alliance formation of the non-Congress forces, the BJP was isolated. The Janata Dal kept a low profile. The Congress thus was without a major ally. It did forge an alliance of sorts with the BPP(P) in Bodo areas which could not actually improve its position. The major sections of the left, regional forces and the ethnic and religious minorities stood solidly behind the AGP-led alliance. The most significant part of this alliance was the coming together of the AGP, CPI and CPI(M). From the beginning of the Assam agitation of the late seventies, the left parties and the forces behind AGP had been at logger-heads. The agitation, because of its focus on Bengali immigrants from Bangladesh, came to be viewed as anti-Bengali. The left parties also opposed the agitation on ideological grounds. Commenting on the character of the movement, Assam's most well known leftist intellectual Hiren Gohain (1980) wrote,

Several leaders of the AASU and the Assam Jatiyatabadi Dal (sic) have made incendiary speeches inciting violence against leftists and 'traitors'...A particularly revealing side-light has been the decisive anti-left orientation of the movement."

But the experience of five years in power and five years in opposition seemed to have helped AGP to learn some lessons. It realised that it could not rule Assam without securing the support of the Ana-Asomiya population. Its silence, on the issue of detection and deportation of immigrants, during the campaign period as reflected in its manifesto indicated this realisation. The alliance with the major left parties was therefore not a surprise. Saikia government's corrupt image and the repressive tactics only become catalysts. The alliance, as we shall see in another section dealing with poll analysis, benefited the AGP most. In the Barak Valley, where in 1985 it could not win a single seat in the assembly elections it won two seats with big margins. The AGP-supported UPPA won another seat in the same area. By preventing the splitting of anti-Congress votes, the alliance proved to be most advantageous to the main non-Congress Party and the main opposition in the previous assembly, namely the AGP, and not only in the assembly elections but also in parliamentary elections.

ELECTION RESULTS

The isolation of the Congress and its inability to keep the focus on the issues on hand seriously affected its prospects. As shown in Table 3, in the Lok Sabha elections the Congress and the AGP won

five seats each. One seat went to an independent candidate. Compared to 1991 (Table 3) the Congress lost three seats, and the BJP lost one. The AGP gained four seats. The CPI(M), ASDC and independents retained their one seat each. Compared to the 1991 elections, the Congress lost four seats to the AGP but it won one seat from the BJP. Thus the Congress' loss was AGP's gain. Though two of these seats, Guwahati and Mangaldoi are constituencies where the Asomiya regional sentiments are predominant and where traditional Congress supporters like the immigrants and the tea-garden labour community are absent. Two other constituencies, Kaliabor and Lakhimpur, have significant tea-labour population. The AGP's victory in these two constituencies shows a decline of Congress influence among the tea-labour. But the AGP candidates won these seats with narrow margins. In Kaliabor, the Congress got 37.7 per cent votes while the AGP polled 37.9 per cent. In Lakhimpur, the Congress polled 32.5 per cent and the AGP polled 33.5 per cent. Two other tea-labour dominated constituencies, Dibrugarh and Jorhat, were retained by the Congress with significant margins. It polled 50.6 per cent in Dibrugarh while the AGP polled only 31.3 per cent. In Jorhat, it polled 48 per cent while the AGP polled 40.7 per cent. The Congress seems to retain its influence among the immigrants. It retained Dhubri seat with 40.1 per cent while the AGP polled 23.2 per cent in the constituency. The BJP's influence in the Barak Valley, dominated by the non-Assamese population, was on the decline but it was not out. The Congress won the Silchar seat from the BJP with 42.7 per cent, but the latter did poll a significant 30.5 per cent votes. In the Autonomous (ST) seat in Karbi Anglong, ASDC polled 52.7 per cent while the Congress polled only 22.5 per cent. The CPI(M) retained the Barpeta seat with 36.8 per cent. The Congress polled only 15 per cent and BJP polled another 14.9 per cent.

REGIONWISE ANALYSIS

The unity of the major non-Congress parties of regional, leftist and ethnic orientations played a decisive role, particularly in the tribal-dominated areas of the state (Table 5). These areas have been traditional Congress bastions in which the party could dominate till 1985. But in this election the non-Congress alliance could defeat the party in constituencies like Baithalangsu, Halflong, Diphu, Gossaigaon, Sidli and Udalguri.¹⁰ In this area, comprising of 14 assembly constituencies, 11

seats went to parties representing respective tribal communities.

Two seats went to the AGP. The Congress drew a blank. In the Karbi areas, ASDC won all the five seats. In the Bodo areas, independents owing allegiance to the various Bodo factions, which were part of the non-Congress opposition, won seven seats and AGP won the other two seats. In the Karbi areas ASDC's margin over the Congress was so high that the latter appeared to be losing its electoral significance. In Halflong, the margin was 13,671, in Bokajan it was 26,843. In Howraghat,

the Congress did not have a candidate of its own but the independent candidate lost to ASDC by 8,495 votes. In Baithalangsu, the Congress lost by a margin of 13,325 votes. In the Bodo areas the winning margins were not very high because of the fact that in those areas no dominant tribal party emerged. The tribal votes thus were divided. But they went against the Congress. The results of this election exposed the myth that in Assam, the Congress influence over tribals was significant.

In the immigrant areas¹¹ also the alliance proved to be effective. As Table 6

shows, in these areas, out of a total of 15 seats, the Congress won four, AGP four, CPI(M) two, UMF two, CPI one, Congress(T) one and PDF won one seat. Thus the AGP and the Congress did equally well. Even their vote share remained more or less equal. It is interesting to note that the UMF claiming to represent minority interests and particularly immigrant minority interests could win only two seats in this region.

Newspaper reports during the run up to the elections show that the Congress was trying to mobilise religious minorities, a large majority of whom were immigrants by activating its minority cell. It also tried to keep the UMF leaders with it. But the riots that took place in many religious minority inhabited areas and the general aversion to communal violence seemed to have created such a situation that the Jamate-Islami's All India President Arsad Madani had to send his brother to campaign for AGP (*Ajir Asom*, April 5, 1996; *The Assam Tribune*, April 17, 1996). The experience of the five years of AGP rule, when there were no riots and when no real attempts were made to deport the immigrant settlers of the 'chars' must have motivated the immigrant population to try its luck with the front. The UMF's failure to make an impact could be understood in terms of the general feeling among Assam voters that political parties do not care specially for particular communities. During the post-poll survey for 1996 election, conducted by the CSDS, when respondents were asked whether they had a particular party which specially cared for them, 85.9 per cent said they did not have such a party while only 5.7 per cent thought that there was such a party.

It has often been held that the tea belt¹² has been a preserve of the Congress and during the last decade, the Congress Party had been able to retain its hold over the main component of the voters of this region, i.e., the tea labourer community. Even during the AGP's wave in 1985 these voters helped the Congress to win the Dibrugarh parliamentary seat comfortably. In the 1996 assembly elections of the total of 30 such tea labour community dominant constituencies the Congress won 16, AGP won 13 and CPI won one seat. The AGP seems to have thus made inroads into the Congress bastion (Table 7).

In fact, the Assam Chah Mazdoor Sangha, an affiliate of INTUC has been organising the tea labour of Assam since 1947. The organisational strength of INTUC in the tea belt of the Brahmaputra Valley had been one of the reasons for Congress dominance in this region.¹³ The situation seems to have changed radically.

The BJP, CPI and the AGP have been trying to find a foothold in this region. The AGP in fact, has started the Assam Chah Shramik Parishad to counter the INTUC. In Chabua area 15,000 tea workers were reported to have left the INTUC controlled Assam Chah Mazdoor Sangha to join Assam Chah Shramik Parishad (*The Assam Tribune*, April 17, 1996). The AASU too has been trying to influence the Tea Tribal Student Organisation for quite some time now. In a community where the large majority are poor and illiterate, students can play a decisive role. This factor has influenced the results of this election. In the assembly elections, the AGP won the Chabua seat though with a small margin. The myth of the Congress invincibility in the tea belt thus stood exploded.

ISSUES IN 1998 ELECTION

Issues in 1998 were the same as in 1996. Only the party at the receiving end changed. It was AGP which faced the music. The situation prevailing in Assam just before the 1998 Lok Sabha election was not conducive to the ruling AGP. Contrary to popular expectations and its commitments to its election manifesto the AGP government imposed repressive measures in the shape of a unified command which resembled very much, in form and content, those followed by Congress ministry. This led to further alienation of people, mainly the Assamese middle class from AGP. The performance of the government was so

TABLE 7: VOTING PATTERN IN TEA GROWING AREAS IN VIDHAN SABHA ELECTION, 1996

poor that even normal obligations like payment to employees, including school teachers, release of funds for institutions of higher learning like universities could not be fulfilled. The bitter confrontation of the government with the major tea houses like the TATA's had also reflected the immaturity on the part of the government. While the attempts of the tea groups to placate the ultra's was understandable, particularly in view of the growing power of the extremist groups in the state during the last few years, the government's failure to provide security to the industry that was so vital to its economy definitely eroded its credibility. This confrontation with tea lobby had drained lot of energy and time, when pressing problems like extremist violence, ethnic conflicts and

infiltration plagued the state (*The Assam Tribune*, November 27, 1997; *The Statesman*, January 26, 1998). Letter of credit (LoC) scandal regarding illegal withdrawal of more than hundred of crores of rupees from the government treasury in connection with the supply of fodder to the veterinary department involving several ministers of earlier government as well as the incumbent ministry including its chief minister together with a host of government officials had turned out to be one of the major scandals that rocked the state and provided the opposition a powerful plank in the election campaign against AGP. The extremists' call to the people to keep away from electoral process had further added to the uncertainty and confusion ('A Lesson for AGP' (editorial), *The Statesman*, March 10, 1998; *North-East Times*, January 4, 1998) prevailing in the state. To make the matter worse, with the killing of a close aide of AGP president in Nowgong by ULFA instilled fear among the workers of political parties. The ULFA's call to the people to boycott the polls this time came as a surprise as the extremist outfit in the earlier elections had not given such a ultimatum to the masses. In fact, the 1991 and 1996 polls had passed off without interference with the fundamental rights of the people (*The Assam Tribune*, February 2, 1998). The situation was further complicated for the AGP for the fact that unlike, in 1996, smaller ethnic and religious parties like the ASDC, the PDF and United Minority Front did not join hands with AGP in this election. The coming together of the tribal groups like the Autonomous State Demand Committee, Mishing Mimang Kebang Autonomous Demand Struggling Front and the CPI(ML) under the banner of Assam People's Front was significant for electoral politics in Assam. The AGP stood alienated from the tribal electorate. Another problem the party faced was factional policy within it leading to the exit of Bhriku Kumar Phukan and the formation of Assam Jatiya Parishad.

The problems of insurgency, corruption, ethnic identity, repeal of IMDT Act and stability constituted the main plank for election propaganda in 1998 Lok Sabha election. Most of the manifestos had focused on these issues. But the parties did not have answers to the problems related to the issues they raised. The BJP manifesto came out with a statement on how the party proposed to tackle the two crying problems of the state: illegal infiltration from Bangladesh and the problem of insurgency. In a section called 'North East' in its manifesto the BJP blamed the

Congress government for its failure to check the illegal migrants in its narrow and selfish interest. Further, it promised to repeal the Illegal Migrants Determination by Tribunal Act (IMDTA) and strengthen existing immigration laws and rules and enact new ones to make illegal infiltration difficult and deny the extension of benefits of citizenship to such entrants (*The Sentinel* (editorial), February 6, 1998; *The Assam Tribune* (editorial), February 5, 1998). The party also promised a plan to deal with the unabated infiltration from across the border, apparently with an eye on the electorate in Assam. To be in tune with the aspirations generated by the 'Assam Agitation' over

the Foreigner's issue it promised to maintain a National Register of Citizens.

The Congress(I) campaign concentrated on the stability plank (*The Assam Tribune*, January 26, 1998). In a separate manifesto on Assam, it promised to undertake or execute certain schemes like preparing a master plan for flood control in the Brahmaputra and Barak Valley. In the second part, the manifesto listed a number of schemes for implementation. The manifesto favoured a peaceful solution to the burning insurgency problem in the state. It also demanded the shifting of the Oil India and Tea Garden Headquarters to the state. In the economic front the manifesto called for a separate economic

policy for the north-eastern region in order to create avenues for the unemployed youth. Further, it emphasised on the preparation of a correct voters list. The main plank of the United Front campaign was the development of Assam. United Front leaders reminded the people that Assam had received a raw deal from the centre when the Congress was in power for more than four and half decades of independence. It claimed that it was the UF government that gave top priority to the development of Assam and rest of the north-eastern region. The Assam People's Front, a combine of ASDC, ADSF and CPI(ML) promised to continue with its relentless efforts to form a strong regional force to fight corrupt AGP, Congress (I) and fascist BJP in the state. APF leader Kaliram Terang expressed that all these anti-people forces could be resisted only through United People's movement (*The Assam Tribune*, February 6, 1998; *Dainik Asom*, February 6, 1998). The party had fielded candidates in five Lok Sabha constituencies. Assam Jatio Sanmilon in its manifesto focused on the issues of correct voters list up to 2000, Repeal IMDT Act, solution of the unemployment problem, flood control and a corruption free state. The Autonomous State Demand Committee (ASDC), on the other hand has revived its demand for an autonomous state. Further, ASDC and PDF have jointly called upon the people of the state to side with the forces opposed to Congress, BJP and AGP. The ethnic issue in fact remained the focal point of ASDC manifesto.

ELECTION RESULTS

The Lok Sabha election 1998 was particularly significant as it was held in the midst of threats posed by militant organisations namely the ULF Assam and Bodo Democratic Front to boycott election. As a consequence, voters turn out was low in the Assamese dominated areas¹⁴ of the state. The ULFA's poll boycott call greatly demoralised the Assamese voters who happened to be the main support base of the AGP. That electioneering fervour was on a very low key was also evident from Post Poll Survey conducted by CSDS. The study indicates low intensity of vote canvassing as well as voters' participation in poll campaign (Table 8 (a) and 8 (b)).

The boycott call was instrumental in tilting the balance in favour of the Congress which capitalised on its known pockets of influence among minorities and tea workers of the state [Goswami 1998]. While the electoral base of the Congress is shrinking and ending in many states in India, it would appear to have

been able to maintain part of its electoral base in Assam. The party has polled 38.9 per cent of votes and gained ten seats and its ally, the United Minority Front won one seat. The AGP and its allies, CPI(M) and CPI contested 12 seats but failed to retain even one of the five seats it held in the last election. The BJP has emerged as an important electoral force and has increased its vote share. Smaller parties reflecting the ethnic and religious identities namely ASDC, UMF supported by Congress and an independent candidate supported by ABSU could retain one seat each (Table 3). On the whole the mandate was against AGP led alliance and also indicative of decline of AGP's support among scheduled castes and scheduled tribes. A comparative analysis of surveys of 1996 and 1998 Lok Sabha election (Tables 9 and 10) by CSDS indicates the changing pattern of support base of different parties. It appears from the surveys that the support of AGP and allies among the Muslims has gone down to 13.4 per cent in this election from 47.3 per cent in 1996. On the other hand the support for the Congress among the Muslim went up to 75.6 per cent as against 50 per cent in 1996. While support for the BJP among Muslims remains unchanged. The change in acceptance of BJP is shown by substantial gains in support from groups that had previously shunned it, e.g., the scheduled castes. The BJP has also increased its base among scheduled tribes and OBCs. The increase in its base among SCs and STs has come at the cost of AGP.

REGION WISE ANALYSIS

A significant shift of tea garden labour and immigrant Muslim votes to the Congress and caste Hindu votes to BJP has led to AGP's debacle in the Lok Sabha election. The Congress could retain Dibrugarh and Jorhat tea garden dominant Lok Sabha seats by polling as high as 64 to 65 per cent of votes. The BJP has also been successful to a great extent to find

a foothold in this region. The BJP has increased its base among tea community at the cost of AGP. The confrontation and bitterness that developed between AGP and the few major tea houses might have a multiplying effect on the entire tea community deflecting their electoral preference away from AGP and closer to the Congress (*The Assam Tribune*, February 16, 1998). Moreover, during the last decades or so quite a few new political leaders have emerged among the tea communities, several of whom occupied very responsible positions in the Congress ministry and enjoyed considerable political clout. No such leader had emerged among the supporters of other political parties including AGP. The role of INTUC which is the oldest labour organisation having allegiance to Congress might have helped the swing towards the Congress.

The results of the immigrant dominant constituencies also went in favour of Congress. Interestingly, loyalty of a sizeable portion of minority Muslims who sided with AGP and allies in the last election have shifted to Congress this time. The Congress retained all the seats in these areas by polling high percentage of votes. The major reason for this change over might have been the apprehension in the minds of minority community that in the event of BJP forming the government at the centre it would certainly repeal the IMDT Act which is considered detrimental to the interest of immigrant religious minority (*Ajir Asom*, February 5, 1998; *The Sentinel*, February 6, 1998). Further, the minorities seemed to have lost their trust on AGP for its mysterious silence over the issue. The AASU on the other hand urged the centre and the state government to delete the names of those voters marked as 'doubtful' in the electoral roll published in 1997 and to repeal the IMDT Act (*The Assam Tribune*, February 16, 1998). It is apparent from the election results that the religious minorities rallied on the side of the Congress and the immigrant linguistic

TABLE 11: LOK SABHA ELECTIONS 1998 : REGIONWISE PERFORMANCE

Hindu minority as well as a small portion of indigenous people supported BJP. But the shift of the minority support has to be seen in the context of the position of the UMF. Electoral alliance with UMF in Barpeta constituency has helped the Congress. The UMF which could poll only 26.7 per cent of votes in 1996 election was catapulted to a high of 58.64 per cent of votes in this election. As Anubhav Dutta says, Hindu polarisation in Assam invariably consolidates the Muslim voters in a more organised way.²⁴ The rise of BJP in religious minority dominant constituencies namely Dhubri, Nagaon and Barpeta has only helped parties like Congress and UMF (Table 11).

The Congress appears to be weak in tribal dominated constituencies even in the 1998 Lok Sabha election. The massive turn out of voters in these constituencies in spite of poll boycott call indicate the prevailing assertive behaviour of the tribal electorate in support of their ethnic identity. The tribals have perpetually experienced the problem of land alienation, poverty, indebtedness, severe unemployment, economic exploitation and cultural exploitation. Therefore, the emerging tribal movements have started asserting their views on their demands, i.e., and creation of Udayachal, Bodoland and an autonomous tribal state in the remaining hills from 1991 election onwards. In the Karbi dominated autonomous parliamentary constituency the ASDC candidate Jayant Rongpi has been elected to the parliament for the fourth consecutive term and its margin over Congress is quite high. The BJP seems to have increased its vote share on these areas from 3.06 to 12.00 in 1998. In the Bodo areas, however, the winning margins were not high as no dominant Bodo leader has emerged. Sansuma Khungur Bwisumthiary backed by ABSTU won the election by polling 25.5 per cent of votes while Congress candidate Prem-singh Brahma, former militant Bodo leader, could poll only 11.8 per cent of votes. Significantly, vote share of AGP candidate has gone down as it could poll only 6.3 per cent of votes while BJP's vote share remain 15.3 per cent. The election results in these areas clearly reflect ethnic polarisation as well as ethnic accommodation.

CONCLUSION

The most significant conclusion that can be drawn from the analysis of the 1996 and 1998 Lok Sabha election and assembly election of 1996 is that regionalism is becoming very important force in Assam politics. However, Assam's multi ethnic and poly-cultural reality adds a peculiar

dimension to regionalism. Unlike most other Indian states where regionalism is being articulated in terms of one dominant cultural community, in Assam a number of smaller ethnic communities are beginning to carve out areas of influence for themselves through parties representing the respective communities. The AGP representing Asomiya interest is emerging as a powerful regional force. The AGP was able to spread its influence in non-Assamese speaking areas, the tea labour dominated areas and also in the immigrant areas which used to be considered the Congress bastions. The ASDC in the Karbi areas and the parties representing the Bodo interest in Bodo areas captured almost all the seats dominated by these communities. And quite clearly in these areas specific issues influenced the voting pattern more than anything else. Two regional issues, viz, Bodoland for Bodos and an autonomous state for the Karbis led to a massive mandate for an independent candidate supported by the All Bodo Student Union and Autonomous State Demand Committee. The non-Congress parties like the left parties, the Janata Dal have not been able to improve their position. The left parties are beginning to recognise the regional forces and are reconciling themselves to the latter's electoral strength. The BJP has gained considerable ground in 1998 compared to its 1996 position. The impressive growth of the BJP has profound implications for the party. These elections also demonstrated that corruption, violation of democratic rights, stability and ethnic identity remained major issues in state politics. Extremists outfits like the ULFA and BDSF seem to play important roles in electoral politics in Assam. It is evident from the performance of the Congress, BJP and the AGP that the main tussle for power remains in the domain of the forces represented by national parties namely the Congress, the BJP and the regional parties of various ethnic communities.

Notes

- 1 The term 'Ana-Asomiya' refers to all non-Assamese while 'Na Asomiya' refers to immigrant Muslim settlers of erstwhile East Pakistan who are assimilated in the Assamese culture.

Secularisation of Caste and Making of New Middle Class

D L Sheth

The changes that have occurred in Indian society, especially after India's decolonisation, have led to a de-ritualisation of caste. With the erosion of rituality a large part of the support system of caste has collapsed. Caste now survives as a kinship-based cultural community but operates in a different newly emergent system of social stratification. By forming themselves into larger horizontal social groups, members of different castes now increasingly compete for entry into the middle class, changing its old pre-independence character and composition. This new and vastly enlarged middle class is becoming, even if slowly, politically and culturally more unified but highly diversified in terms of the social origins of its members.

EXISTING for thousands of years, the caste system got its name about 500 years ago from the Portuguese when they landed on the Malabar coast and began to have 'direct experience' with Indian society.¹ Derived from 'casta' in Portuguese, the term caste has since been used generically to describe the whole ('varna-jati') system as well as specifically to refer to its various orders and the units within an order. The Portuguese 'discovery' of caste, however, went much beyond giving a name to India's varna-jati system. Portuguese were the first among Europeans to provide detailed accounts of its functioning. The most perceptive, empirical account of caste was given by the 16th century Portuguese, Duarte Barbosa. Barbosa identified the main features of caste: (a) Caste as a hierarchy, with brahmins at the top and 'untouchables' at the bottom; (b) untouchability as linked to the idea of 'pollution'; (c) existence of a plurality of 'castes' separated from each other by endogamy, occupation and commensality; (d) application of sanctions by castes to maintain their own customs and rules; (e) relationship of caste with political organisation.

Although Barbosa did not provide a 'systematic' account, the elements of caste he identified remain central to any definition of caste, even today. Moreover Barbosa's approach to reporting about caste had some distinctive qualities.

First, he described caste as he saw it functioning on the ground; he got his facts by talking to common people in their own language. Second, he did not use the religious scriptures as a source of information on caste; there is no reference to the varna theory of caste in his narratives. Three, he related the idea of pollution to the practice of untouchability and not to functioning of the whole system. Fourth, he saw caste not exclusively in ritual-

status terms, but also as a plurality of 'self-governing' cultural communities. Fifth, he stuck to a matter-of-fact account of what he saw and was told about caste, and refrained from moralising and passing value judgments on it.

COLONIAL DISCOURSE

Nothing much of significance was added or any improvement made to Barbosa's account for the next 250 years by his European successors reporting on caste. It was only after the British rule was established in India that a second 'discovery' of caste was made by the Europeans. The Western Orientalist scholars, the Christian Missionaries and the British administrators began, in their different ways, to make sense of this complex phenomenon. A new, colonial discourse on caste was born. It marked important departures from pre-colonial accounts of caste. It is important to note some distinctive feature of this discourse because for decades after India's independence the studies of caste continued to be guided by the terms set by the colonial discourse.

One, the new discourse centred on whether caste was a system beneficial to Indians or it worked against them. The Orientalist scholars viewed caste as serving some positive functions, whereas the missionaries saw it as an unmitigated evil. Second, both its sympathisers and opponents, saw caste in highly schematised and unidimensional terms: as an inflexible hierarchy of vertically ranked ritual statuses. The idea of pollution, which Barbosa saw in the context of untouchability was now generalised for the whole system in which the idea of ritual purity and impurity of statuses was considered the central principle governing the caste-system. The reality of caste was recon-

structed largely from its depiction in the religious scriptures. In the event, Barbosa's empirical view of caste was now superimposed by the scriptural (ideological) varna view of caste. Three, with the 'discovery' of Hindu scriptures by the Orientalist scholars, caste became a prism through which the colonial rulers began to see Indians and the whole Indian society. Caste was now seen as representing a worldview of Indians and a totality of India's social and cultural life. Certain non-ritual, even non-religious elements which always existed in the caste system and informed quite a few aspects of inter-caste relations, were theoretically ruled out of the system.

Four, in the course of setting-up its revenue administration, a number of land and village surveys were launched by the colonial regime in different regions of India. This focused the attention of revenue administrators, many of whom were anthropologically inclined scholars, on the Indian village – which was also a revenue unit. This focus developed into a view of village as a microcosm of the Indian society, and caste as constituting its social, economic and political organisation legitimated by its religious ideology.

In this village view of caste, caste was seen as an ensemble of local hierarchies, each contained within a village or a group of villages. This view contributed to the image of the village as a stable, unchanging social system. In the latter ethnographic studies of caste carried out by Indian sociologists, although the varna theory was discarded, caste continued to be seen as a vertical hierarchy of ritual statuses embedded in the religious and cultural context of the village.

Fifth, the administrative and anthropological concerns of the British officers led them to counter both the Orientalist and the Missionary views of caste. Their

concern was utilitarian, about finding administrative and political ways to tame and change this formidable system functioning from ancient times, to suit the needs of the colonial polity and economy. This concern of the colonialists prompted an ideological debate on caste. The debate achieved a degree of political sophistication which was not shown earlier either by the Orientalists in their appreciation or the Missionaries in their condemnation of the caste system. The debate introduced a new, theoretical-comparative dimension for viewing caste. Caste now began to be seen in comparison with the normative (values of equality, individualism, etc) and social (estate, race, class, etc) categories of the western societies. Eventually, with the English educated nationalist Indians joining the debate, on the terms set-up by the colonial regime, caste became a bone of contention between conservatives and progressives, traditionalists and reformers. Valuation became the mode of observation.

Sixth, the method the British administrators adopted in reporting about caste, unlike that of the Orientalist scholars, was empirical. The British did not see the caste-system only in terms of the varna categories. They also saw castes as separate communities often divided by descent, political organisation and customs. Consequently they theorised caste in terms of its racial and tribal origins and character. In fact multiple and elaborate systems of classification of castes were evolved by them based on a variety of ethnographic materials, officially obtained through various village and caste surveys.²

Seventh, crucial to the colonial discourse was the relationship between caste and the state. From 1901 Census, the colonial state began castewise enumeration of the entire Indian population. The decennial censuses not only updated, every 10 years, the population figures for enumerated castes, but gave them specific names/labels and ranks. In doing so, the census officers tended to rely on their 'reading' of the scriptures as well as local knowledge and practice. But when a name and/or a rank given to a caste was in dispute – and this happened frequently – the census officer's 'anthropological' judgment, albeit tempered by representations received from leaders of concerned caste, prevailed. Thus, despite the diversity of the debate, at the end of the day, the criterion of 'social precedence of one caste over the other', i.e., the scriptural principle of ritual status hierarchy, was explicitly and officially recognised.

The colonial state, thus, acquired an agency, even a legitimate authority, to

arbitrate and fix the status claims made or contested by various castes about their locations in the ritual hierarchy. At the same time the enumeration of castes and their ethnographic descriptions compiled by the state, highlighted how the social and economic advantages accrued to some castes and not to others in the traditional hierarchy. This led to demands among many castes for special recognition by the state for receiving educational and occupational benefits as well as for political representation. The colonial state assumed a dual role: of a superbrahmin who located and relocated disputed statuses of castes in the traditional hierarchy and of a just and modern ruler who wished to 'recognise' rights and aspirations of his weak and poor subjects. This helped the state to protect its colonial political economy from incursions of the emerging nationalist movement. Among other things, it also induced people to organise and represent their interests in politics in terms of caste identities and participate in the economy on the terms and through mechanisms set by the colonial regime.

On the whole, the colonial regime, not only introduced new terms of discourse on caste, but brought about some changes in the caste system itself. A large part of these changes, however, were unintended consequences of the colonial policies; they were related to the larger historical forces of modernisation, secularisation and urbanisation which had begun to make some impact on the Indian society by the end of 19th and the beginning of the 20th century. But some specific policies of the colonial regime, aimed at delegitimising the power of the traditional social elites and creating support for its own rule, had direct consequences for the caste system. Towards the end of the colonial rule such policies alongside the larger historical forces, had produced some profound and far-reaching changes in the caste system.³

The most important among the changes was the formation of a new, trans-local identity among 'lower castes', collectively as a people with the consciousness of being 'oppressed' by the traditional system of hierarchy. The discourse of rights, until then quite alien to the concepts governing ritual hierarchy, made its first appearance in the context of the caste system. New ideological categories like 'social justice' began to interrogate the idea of ritual purity and impurity according to which the traditional stratificatory system endowed entitlements and disprivileges to hereditary statuses. The established categories of ritual hierarchy began to be confronted with new categories like

'depressed castes' and 'oppressed classes'.⁴

Second, several castes occupying more or less similar locations in different local hierarchies began to organise themselves horizontally into regional and national level associations and federations, as it became increasingly necessary for them to negotiate with the state and in the process project their larger social identity and numerical strength.⁵

Third, movements of the lower castes for upward social mobility, which were not new in the history of the caste system, acquired a qualitatively new dimension as they began to attack the very ideological foundations of the ritual hierarchy of castes, in terms not internal to the system (as was the case with the Buddhist and Bhakti movements), but in the modern ideological terms of justice and equality.

Changes that occurred in the caste system during the colonial period have greatly intensified after India's de-colonisation. Further, with India establishing a liberal democratic state and the growth of institutions of competitive, representational democracy, the changes acquired newer dimensions and a greater transformative edge. All this has produced some fundamental structural and systemic changes in the traditional stratificatory system.⁶

Despite the fact that after India's independence such qualitative changes had occurred in the stratificatory system, the changes continued to be interpreted, in the old, colonial ideological-evaluative frame. The terms and categories used for describing these changes – by the sociologists studying caste as well as by social reformers and political thinkers wanting India to become a caste-less society – were derived from the colonial discourse. This gave rise to two opposite views of change in the caste system, which in fact represented mirror-images of each other. One view, that has long dominated studies of caste in post-independent India, emphasises certain structural and cultural continuities the Indian society has manifested in the course of modernisation. In this view, changes in caste are seen in terms of functional adjustment made by the system for its own survival and maintenance. The other view, that dominated the political-ideological discourse on caste until recently, sees modernisation as a linear, universal force of history, transforming the caste system into a polarised structure of economic classes. On the whole, the discourse on caste in post-independent India remained bogged down in the dichotomous debate on

'tradition' verses 'modernity' and 'caste' verses, class'

I Secularisation of Caste

The dichotomous view of change has prevented scholars, policy-makers and political activists alike, from taking a view of the process by which caste has changed and a new type of stratificatory system has emerged. This process, which can broadly be characterised as secularisation of caste, has detached caste from the ritual status hierarchy on the one hand, and has imparted it a character of the power-group functioning in the competitive democratic politics on the other. Changes in caste thus could be observed along these two dimensions of secularisation: de-ritualisation and politicisation. These changes have (a) pushed caste out of the traditional stratificatory system, (b) linked it to the new structure of representational power, and (c) in their cumulative impact they have made it possible for individual members of different castes to acquire new economic interest and social-political identification and own class-like as well as ethnic-type identities. Thus secularisation of caste, brought about through its de-ritualisation and politicisation, has opened up a third course of change. For a lack of more appropriate term I call it *classisation*. In the following sections I shall describe these three processes of change in caste and their implications for the emergence of a new type of stratificatory system in India.

DE-RITUALISATION

Caste has been conventionally conceived as an insulated system of ritual status hierarchy, embedded in the 'perennial' religious culture of India. Rituality (i.e., rootedness of caste behaviour and organisation in the religious ideology and practices) thus constituted the core of the whole system of castes. It enabled caste to maintain autonomy and stability of status-hierarchy in the face of changes, both economic and political, that occur in the wider society. In this perspective, caste 'accommodated' these changes only to an extent the system could absorb them without losing its structural and cultural integrity. In responding to these changes caste was seen to have found 'new fields of activity' and assume new functions, but all this to retain its basic structure and ideological (religious) core. The insularity of the caste system is thus guaranteed, because it is bounded by certain ideological

and structural contexts – each articulating a form of rituality. More specifically, these contexts pertain to: (a) the religious ideology of purity and pollution (b) the religiously sanctioned techno-economic and political organisation of the village, especially its food production and distribution system; (c) customs and traditions of castes evolved over centuries. Caste not only survived but grew in these contexts and acquired its systemic character; they constituted its 'support system' of the ritual hierarchy.

In what follows, I argue that the changes that have occurred in Indian society, especially after India's decolonisation, have led to de-ritualisation of caste – meaning delinking of caste from various forms of rituality which bounded it to a fixed status, an occupation and to specific rules of commensality and endogamy. I further argue that with the erosion of rituality, a large part of the 'support system' of caste has collapsed. Uprooted from its ritually determined ideological, economic and political contexts it has ceased to be a unit of the ritual-status hierarchy. Caste now survives as a kinship-based cultural community, but operates in a different, newly emergent system of social stratification.

Modernisation of India's economy and democratisation of its political institutions, have released new economic and political power in the society. The hierarchically ordered strata of castes now function as horizontal groups, competing for power and control over resources in society. Alongside this change in the organisational structure, i.e., its horizontalisation, the form consciousness takes has also changed. That of members belonging to a caste is expressed more in the nature of community consciousness, rather than in hierarchical terms. Caste consciousness is now articulated as political consciousness of groups staking claims to power and to new places in the changed opportunity structure. It is a different kind of collective consciousness from that of belonging to a 'high' or 'low' ritual status-group. The rise of such consciousness of castes has led to disruption of hierarchical relations and to increase in competition and conflict among them. Far from strengthening the caste system, the emergent competitive character of 'caste consciousness' has contributed to its systemic disintegration. The disintegrating system of traditional statuses is now thickly overlaid by the new power system created by elections, political parties and above all by social policies – such as of affirmative action – of the state.

Fundamental changes have occurred in the occupational structure of the society. A vast number of non-traditional, unbound-to-caste occupations and a new type of social relations among occupational groups have emerged. This has resulted in breaking down the nexus between hereditary ritual status and occupation – one of the caste-system's defining features. It is no longer necessary to justify status of one's occupation in terms of its correlation with degree of ritual purity or impurity associated with it. The traditional, ritualistic idea of cleanliness or otherwise of the occupation one follows has become unimportant; crucial consideration is what brings a good income to the individual. A brahman dealing in leather or an ex-untouchable dealing in diamonds is no longer looked upon as a socially deviant behaviour. That the former is more a frequent occurrence than the latter has only to do with the resources at one's command and not with observance of ritual, prohibitions attached to the statuses involved. More importantly, the cleanliness or otherwise of an occupation is increasingly seen in physical and biological sense than in ritual or moral terms.

Significant structural differentiations have taken place within every caste. Traditionally, an individual caste bounded by rituals and customs, functioned internally as a truly egalitarian community, both in terms of rights and obligations of members vis-a-vis each other and of lifestyles, i.e., the food they ate, the clothes they wore, the houses they lived in, etc. Differences in wealth and status (of clans) that existed among households within the same caste were expressed, often apologetically, on such occasions as weddings and funerals but rarely in power terms vis-a-vis other members of the caste. Today, households within a single caste have not only been greatly differentiated in terms of their occupations, educational and income levels and lifestyles but these differences have led them to align outside the caste, with different socio-economic networks and groupings in the society – categories which can not be identified in terms of the caste system.

The caste rules of commensality (i.e., restrictions about accepting cooked food from members of other castes) have become almost totally inoperative outside one's household. Even within the household, observance of such rules has become quite relaxed. In 'caste dinners', for example, friends and wellwishers of the host, belonging to both the ritually lower as well as higher strata than that of the host are invited and are seated, fed and served

together with the members of the caste hosting the dinner. The caste panchayats, where they exist, show increasingly less concern to invoke any sanctions in such situations.

The castes which occupied a similar ritual status in the traditional hierarchy, but were divided among themselves into sub-castes and sub-sub-castes by rules of endogamy, are now reaching out increasingly into larger endogamous circles, in some cases their boundaries co-terminate with those of the respective varna in a region to which they supposedly belong. More importantly, intercaste marriages across different ritual strata, even often crossing the self-acknowledged varna boundaries, are no longer uncommon. Such marriage alliances are frequently made by matching education, profession and wealth of brides and grooms and/or their parents, ignoring traditional differences in ritual status among them. Significantly, such intercaste marriages are often arranged by the parents or approved by them when arranged by the prospective spouses on their own. The only 'traditional' consideration that enters into such cases is the vegetarian-meat-eating divide which is also becoming quite fuzzy. Although statistically the incidence of such inter-caste marriages may not be significant, the trend they represent is. A more important point is that the mechanisms through which castes-enforced rules of endogamy have weakened in many castes.

The ideology and organisation of the traditional caste system have thus become vastly eroded. Its description as a system of ritual status hierarchy has lost theoretical meaning.⁸ As may be expected, such erosion has taken place to a much greater extent and degree in the urban areas and at the macro-system level of social stratification. But the local hierarchies of castes in rural areas are also being progressively subjected to the same process.⁹ In the villages, too, traditional social relationships are being redefined in economic terms. This is largely because in the last three decades, particularly after the 'Green Revolution' and with the increasing role of the state and other outside agencies, in the food production and distribution system in rural areas, the social organisation of the village has substantively changed. From the kind of social-religious system the Indian village was, it is increasingly becoming primarily an economic organisation. The priestly, trading and service castes, i.e., social groups not directly related to agricultural operations, are leaving villages or serving them, if and when such services are still

required, from nearby towns. Members of such castes continuing to live in the villages have largely moved out of the 'village-system' of economic and social interdependence of castes. They increasingly function in the emergent national-market related rural economy or the secondary and tertiary sectors of employment.

In this process many a caste has structurally severed its relationship from the system of ritual obligations and rights which once governed its economic and social existence and gave it an identity in terms of its status in the ritual hierarchy. Intercaste relations in the village today operate in a more simplified form, as between castes of land holders/operators and those of the landless labour. This relationship between them is often articulated in terms of political consciousness of two groups of castes representing different economic interests in the changed political-economy of the village.

The socio-religious content of economic relationships in the village has thus largely disappeared; they have become more contractual and almost totally monetised. The traditional jajmani relationships, which regulated economic transactions between castes in social-ritual terms, have been replaced by relationships of employer and employee, of capital and wage labour. When the traditional social and religious aspects of economic relationships are insisted upon by any caste, such as traditional obligations of one status group to another, it often leads to intercaste conflicts and violence in the villages. In brief, the pattern of social relations sustained by the internal system of food production of a village and by conformity of status groups to their religiously assigned roles in the system and to norms defining the roles, has virtually disintegrated.

In sum, while castes survive as micro-communities based on kinship sentiments and relationships, they no longer relate to each other as 'units' of a ritual hierarchy. The caste system, for long conceived as a ritual status system, has imploded. Having failed to cope with the changes that have occurred in the larger society, particularly after India's decolonisation, the caste 'system' is unable to maintain itself, on the basis of its own principle of ritual hierarchy. It cannot sustain vertical linkages of interdependence and cooperation among its constituent units, nor can it enforce its own rules governing obligations and privileges of castes vis-a-vis each other.

In a few specific contexts where ritual relationships between castes still survive, they have acquired contractual, often conflictual, forms negating the system's hierarchical aspect. Ritual roles which members of some castes (e.g., the role of a priest or a barber) still perform have been reduced to those of functionaries called upon to do a job for payment on specific occasions (weddings, deaths, etc.). Performance of such roles/functions by a few members of a caste, however, has no relevance for determining its place in the changed stratificatory system. Such roles, it seems, now survive outside the stratificatory system, as a part of Hindu religious practices. But such phenomenal changes have, occurred in Hinduism itself in recent years, that intercaste relations can no longer be viewed as constitutive of a ritually determined religious practice. The growth in popularity of new sects, of deities and shrines, and the growing importance of gurus and godmen and the new practice of public celebrations of Hindu religious festivals on a much wider social and geographical scale, involving participation of members of a number of castes across ritual hierarchy and regions, have all shored up popular-cultural and political aspects of Hinduism. These have considerably weakened the traditional ritual and social organisational aspects of Hinduism. In this process, intercaste relations have not only lost systemic context, but also to a large extent the religious reference. Castes, now negotiate their status claims in the newly emergent stratificatory system.

The simultaneous processes of detachment of castes from ritual hierarchy and the growth, albeit in varying degrees, of economic, social and cultural differentiations within every caste have resulted in castes entering into various new, larger social-political formations which have emerged in India's changing stratificatory system. As we shall see in the next section, each such formation grew in the process of politicisation of castes and has acquired a new form of collective consciousness, a consciousness different from that of a ritual status group. Yet the new consciousness is not of a 'class' as in a polarised class structure. This consciousness is based on a perception of common political interest and modern status aspirations on the part of members of these new formations. In this process, the unitary consciousness of individual castes has become diffused into an expanded consciousness of belonging to a larger social-political formation, which cannot be described as a 'caste' or 'class'.

For some two decades after independence, the political discourse on caste was dominated by left-radical parties and liberal-modernist intellectuals who saw, rather simplistically, changes in the caste system in linear terms, i.e. changes as suggestive of its transformation into a system of polarised economic classes. In believing so, they ignored the fact that while caste had lost its significance as a ritual status-group it survived as a 'community', seeking alliances with other similar communities with whom it shared commonality of political interest and consciousness. Consequently, political parties of the left, both the communist and the socialist, by and large, sought to articulate political issues and devise strategies of mobilising electoral support in terms of economic interests which in their view divided the social classes in India.¹⁰ In the event, although these parties could credibly claim to represent the poorer strata and they even occupied some significant political spaces in opposition to the Congress Party at the time of independence, they failed to expand their electoral support in any significant measure for decades after independence.
